CHAPTER 1

Introducing Mindfulness

Patrick Kearney · 31 min

> *Patrick Kearney begins this month-long retreat by clarifying the essential Buddhist concept of sati (mindfulness), distinguishing it from the popular secular understanding. Through a practical hands-on exercise, he demonstrates that mindfulness is not mere awareness, but rather "remembering awareness" - the active practice of continuously returning attention to present experience.*
>
> *Drawing from the Satipaṭṭhāna practice, Kearney explains that sati literally means memory, but specifically remembering the present rather than the past. He contrasts this with our modern relationship to time, showing how the Buddha's understanding of the present differs from our moment-based conception. The talk explores both directed attention (noting practice with meditation objects) and receptive awareness (noticing what arises in daily activities).*
>
> *Kearney addresses the distinction between sammāsati (right mindfulness) and micchāsati (wrong mindfulness) on the Noble Eightfold Path, emphasizing how direction and intention determine whether mindfulness leads toward awakening. He offers practical guidance for retreat participants on establishing general mindfulness through body awareness, graceful movement, and observing mental states without getting caught in thought content, explaining how continuous mindfulness naturally leads to samādhi.*

Tonight we're going to talk about mindfulness, sati in Pali. The practice that we're doing is satipatthana, the establishing of mindfulness or cultivation of mindfulness or application of mindfulness. The core concept is mindfulness, so we need to get clear about it.

Mindfulness, of course, has become incredibly fashionable and now has spread like a cancer across the planet in the secular mindfulness worlds of psychology and psychotherapy and even management and business. There's a great deal of confusion in this secular mindfulness world. What I want to do first is to introduce and clarify what is meant by mindfulness.

I want to start by having a little mindfulness experiment. What I want you to do is hold your hands together like this. My question to you is: can you feel your hands? It's not a trick question, by the way.

You can feel your hands. Good. Are you making any particular effort? No? It's pretty straightforward?

If you put your hands together and you ask yourself the question, "Can I feel my hands?" and the answer is yes, that's awareness. Remember we were talking about awareness this morning. Awareness is the presence of what is present. I am aware of the touch of my hands. You notice there's no effort involved. It's just bleeding obvious.

Now I'd like to do a very similar exercise where we're going to do the same thing but we're going to do it for two minutes. What I want you to do is this: if at any time during those two minutes you suddenly realize that you have lost awareness of your hands, that your attention has gone somewhere else and therefore you've lost the hands, then raise your hand. Is that clear?

Let's not make it complicated. If your attention leaves your hands so that you've lost that feeling, raise your hand.

How many hands did we have up? It's a goodly number. I knew you were an experienced bunch. How many people maintained it for two minutes? How did you manage it? How did you do it?

One person said, "I'm not quite sure, but I was moving the hands a little bit to remind myself. I noticed that the attention varied in its intensity. So there would be a thought, but I never quite lost it."

Another mentioned, "I used my hands as a primary grounding object before. The field of awareness started at the whole hands and then gradually narrowed down to a point, just a little point, and then I moved the point around."

"I was deliberately renewing my attention," said someone else. "I just reminded myself."

Of course, the reason why we do this is simple: put your hands together, feel your hands—dead easy, no effort. But do it continuously for just two minutes and it's a much bigger job.

Someone raised the question, "Well, do you mean if attention slips away just for a moment?" The answer to that is: you've lost it. It's gone for a moment—it's gone.

It seems like you can hold other things like sounds at the same time and still feel you're in touch with the hands. So you haven't lost it then?

"Well, it feels like you can hold more than one thing at the same time if you have a broad sort of awareness."

Yeah, that's possible. Did you do that?

"With sound, it still felt like I had some contact with the hands."

So that's how you managed to keep it. You would accept other things coming in.

"Until there was a louder sound and then the elastic band snapped."

The difference between these two exercises is the difference between awareness and mindfulness. Some people confuse mindfulness with awareness. They think it's another way of saying the same thing. It isn't. It's different.

Mindfulness is the translation of the Pali word *sati,* which means literally memory. Mindfulness is not awareness. It's remembering awareness.

So those of you who were successful in maintaining it for two minutes did so by literally reminding yourself: I'm supposed to be aware of the hands. And there are different ways you can do it. One way is, in fact, by movement. If you keep things moving, that can help. Another way that some people use—some people managed to really squeeze their hands together tightly, other people stare at them fixedly. There are different techniques that people have developed.

But you see that even if you succeed, it's a much bigger job. To maintain a felt continuity of awareness over time is not easy. And this is mindfulness. It's remembering awareness. Remembering I am already aware. Remembering to be aware of this, my meditation object. These are the two flavors. And what we were practicing was the second one: Remember the hands. Don't forget the hands. The hands are something I'm supposed to remember.

Usually when I lose it—well, the most obvious place when I lose it when I'm doing this exercise—is at some point I look up to check how people are going and how many hands are up. Damn it! Inevitably, that's when I completely forget the hands.

This time I looked really slowly. I'm not going to do it this time. And I managed to check the hall and come back to the hands, and I was still with them. And then I congratulated myself. And they were gone.

Now when I congratulated you—when I said okay, I can see you're experienced meditators because so many hands went up—I'm not being ironic or sarcastic. I mean it.

In the world of secular mindfulness, one of the big problems they have is how to measure mindfulness. Because if you're doing a scientific study, you've got to measure your results. So there's all this debate in the social sciences about how do you measure mindfulness?

One of the standard ways, which is really dubious, is self-reports. People have created these questionnaires, and if you answer the questions appropriately, it shows you've attained a certain level of mindfulness. Some of the questions are really weird, but anyway, we won't go into that.

But it's the standard thing in mindfulness interventions. A standard pattern of behavior is you get a group of people—these are people who have never meditated. Then you give them the questionnaire to rate their mindfulness. And normally they'd score themselves up here. In other words: Yeah, yeah, I'm pretty mindful.

Then they start the mindfulness training and at some point down the line they do the same test and they rate themselves down here. The mindfulness level collapses dramatically.

Now the reason is because they're becoming more mindful and they're noticing that the mind slips away, whereas before they hadn't noticed. And that's one of the tricky things about doing this exercise. The more deeply you go into meditation practice, there's a sense in which the harder it is to do this—because you can see how the mind can flash away and come back.

and come back in less than a finger snap. It is so fast. So is that continuous or is that not continuous?

Usually when I do this exercise, I will ask people, especially if there's a large number of people who have not raised their hands, "Okay, how many of you are absolutely certain that not for a moment did the mind slip away?" And then it turns out that a lot of people who never raised their hands are now raising their hands and saying, "Well, well, you know, it could have been, but it was really quick."

So it's an interesting exercise because it shows you how the mind works and illustrates the nature of mindfulness.

Mindfulness is memory. You know those signs you see at the train stations? "Mind the Gap." The way they use the verb "to mind" is exactly what the Buddha is talking about when he's talking about sati. If you say "mind the gap," what are they asking you to do? They're asking you to remember that there's a gap between the train and the platform.

Now, when do they expect you to remember this? Are they asking you that when you go home, having a quiet drink at night, you can reflect, "Yes, yes, there was a gap between the train and the platform"? No. They're asking you to remember it in the very act of stepping in and out of the train. In other words, they are asking you to remember the present, not the past.

And that is exactly the function and the meaning of mindfulness. It's all about memory, but it's about remembering the present, not the past. And the work of mindfulness is reminding ourselves. A couple of people have said it: "How did you manage it?" "Well, I kept reminding myself." That's exactly what we're doing in this retreat.

Our job for the next month is to remind ourselves of our awareness. As we said, we don't have to do anything to be aware. We are already aware, but we easily forget our awareness. We forget that we are aware, or we forget what we are aware of. Our job is to keep reminding ourselves of our awareness, reminding ourselves what we are aware of.

This morning we talked about the meditation method. You can direct, in terms of noting, directed attention. We direct ourselves to something. So we have a meditation object, and for the next thirty minutes, sixty minutes, whatever, I'm going to keep my awareness on this object. The job is to remind ourselves to be aware of this, my meditation object. So the mindfulness is directed along with the awareness.

Then we talked about noticing, which is receptive, where the things come to us. And this is in particular in daily activities. There, I'm reminding myself: I am already aware, I am already seeing, I am already hearing, I am already walking, I am already cold, I am already warm, I am already tired, I am already awake. Whatever the condition is. But it's reminding myself, this is what's happening.

So the work of mindfulness—and you notice that it does involve effort. Not a lot of effort, but it does mean we've got to be switched on. We've got to keep switching on again and again and again. And it's not a big deal when we do it, but we do have to do it. And we have to do it now.

So this is the job of mindfulness training: to remind myself of my awareness, to remind myself either this is what I'm aware of, or to remind myself I am already aware. Is that making any sense? Any questions? Comments?

One thing I'd like to point out or talk about is what we mean by the present. Because I think this can be, can lead to confusion. In our culture, when we—well, you notice that in Dharma talks and Dharma literature, people talk about the present a great deal.

And years ago I noticed that, as a Dharma teacher, I talk about the present a lot. And I noticed that every time I would use the word "present," I would add the word "moment."

I realized I did this because I was so habituated to it—because when I read Dharma books, this is what people do. If they talk about the present, they talk about the present moment. Sometimes people will even drop the word present and just say "the moment." So if you're in a Dharma talk and someone says, "You must be in the moment," does it occur to you to wonder—to put your hand up and say, "Which moment are you talking about? There are a lot of them." Because it's obvious, isn't it? It's the present moment.

What struck me was that the Buddha talks about the present, but I've never come across a reference where he adds the word moment. I wondered why. It's so obvious and natural to us—why doesn't he do it? It struck me that he must have had a very different relationship to time than we have.

Our relationship to time is basically conditioned by technology. It makes sense for someone to say, "I will meet you at 3:15." That's a coherent, meaningful statement. And if someone turns up at 3:18, it's coherent, although perhaps obsessive, to say "You're late." If you were on the receiving end of that, what you had just heard would be perfectly meaningful. It might be a bit weird, but it's perfectly meaningful.

But if you were talking like this in the Buddha's time, no one would know what you're talking about. "3:15? What? You're saying I was three minutes late? What the hell are you talking about?" They would literally not know what you were talking about because they didn't have these accurate measurements of time, so the whole relationship to time would have been very different.

When the Buddha talks about time, the time he is talking about is experienced time, not the measured time of the clock.

Here's a question: Do I experience the present as a moment? Well, sometimes I do—most commonly when I'm stressed, when I'm pushing to meet a deadline, or if I'm restless and agitated and just want to get to something else, or if the adrenaline is really flowing.

But when I come to meditate, what I find is the more I get into it, the more the present starts to expand. It gets bigger and bigger and bigger. In fact, one of the problems with a moment—using that concept—is a moment is a very short period of time which has two very clear borders. It begins and it ends.

What I would suggest to you as a meditation experiment is: see if you can find the border where the present becomes the future. Try doing it. I've tried. I've never found it. Or can you find the border where the past becomes the present? I've never managed that either. Whenever I look, all there is, is the present.

I find that when I get into the meditation, past and future actually drop away. They simply don't exist. And when I'm really intimate, the present also disappears. But the point here is that the present—the experienced present—is big.

This is one way in which it's possible to talk about remembering the present. Sometimes people resist this idea because they say, "Well, if I'm remembering, I'm just going back to the past. Aren't I supposed to be in the present?"

But the experienced present includes the past, or some aspects of the past. For example, it can be quite useful—let's say I'm meditating and I realize that I'm distracted—it can be very useful to, as it were, look back and ask: What happened just then? How did I lose it? How did the mind slip away from the meditation object?

That's definitely remembering. But if you find it, if it's available, you're doing it in the present. There's a sense in which you are remembering the present. Of course, if you don't get it, well fine—you just drop it. You don't go chasing, you don't think about it.

But as we deepen into the practice, we begin to recognize that the present is actually quite expansive—it's a field within which we can dance. This is the present that we are remembering. Does that make sense?

Any questions or comments about that?

We're at the beginning of the retreat, and generally at the beginning we're more concerned with a general mindfulness—remembering I am already aware. So I am already seeing, I am already hearing, I am already thinking, I am already sitting. Just being present to whatever is happening.

Often it's best to start with seeing and hearing. Don't avoid seeing and hearing. You don't have to go around with your eyes glued to the ground, trying not to hear anything. You can be mindful with the senses wide open. When I see, I'm aware that I'm seeing. When I hear, I'm aware that I'm hearing. That's what's important.

Grounding yourself in the body is extremely useful. Stay with movement and touch—the movement of the body and the contact with the floor, and also particularly with the hands, whenever the body touches something.

When you move, move gracefully and quietly. Notice any clumsiness. Any time you're clumsy, when you fumble something, check the mind. Is the mind here, embodied in this particular time and place, or is it lost in some faraway fantasy? Often we notice that when we're distracted, that's when physical clumsiness occurs.

For example, when I'm opening and closing doors, I open the door and realize—bang!—I've just made an incredibly loud noise. I've opened this door really noisily. If I stop and check, where was the mind? Usually I discover, oh, I was thinking about something. I wasn't actually here. I wasn't actually present for opening the door. I didn't remember I was opening the door. And that's when I made the noise.

With the mind, don't fight thinking. Just be aware of it. The job is not to stop thinking. The job is to be aware of what the mind is doing, including thinking. What is the experience of thinking? How do I know that I'm thinking? What does thinking feel like? What's the energy of it? In other words, how fast is it? How slow is it?

This is becoming interested in what the mind does. And again, people were talking about the importance of being interested in the exercise of holding the hands. Be interested in what the mind is doing. It's not getting caught up with what I'm thinking about—the content of thought—but just the activity of thinking itself. When I'm thinking, I'm aware that I'm thinking. And I'm aware of what it's like.

And deeper down, what's the condition of the heart? What we would call the emotions. Is the heart disturbed? Does it shake or tremble? Is it restless? Is it resisting the experience? Is it grabbing onto something? Is it grasping after something? Is the heart at ease? Is it enjoying being here? Or not?

In the early stages of the retreat, it's a settling into present experience. Don't force it. Don't push it. Just let it settle. And what will allow it to settle is this practice of mindfulness, of reminding myself: this is what's happening. Oh, that's right, this is happening.

This is happening. There was something I was supposed to remember. Oh, that's right, this is happening. What was it I wrote? Ah, this is happening. That's the work of the practice, this reminding myself.

And the Buddha teaches that if mindfulness is continuous, concentration, samadhi, will naturally follow. It will just start to happen. But the crucial point is the mindfulness.

A student asked about the definition of meditation in the Buddhist context as a training of awareness and attention, noting that this could describe almost any skill, wondering what makes Buddhist meditation distinctive.

The Buddha distinguishes between the Eightfold Path and the Noble Eightfold Path, the Arya Eightfold Path. He distinguishes, for example, between mindfulness and right mindfulness. In the terms of the path, it would distinguish between right mindfulness, samma sati, and wrong mindfulness, miccha sati. This is all about direction.

So am I practicing mindfulness to send myself in the direction of enlightenment or awakening? Or am I cultivating mindfulness to send myself in another direction?

On the odd occasion that I see obsessive politicians on the media, these people must be quite mindful in terms of what they're doing because they work relentlessly hard. It's like the mindfulness of a sniper. It's mindfulness, but it's not what the Buddha would call right mindfulness because it's taking the citta in the wrong direction.

When asked whether one could have wrong mindfulness or wrong concentration about a wholesome object, I responded that you could. When you meditate, what you find is that a lot of the time you notice yourself losing the balance. You're pulling back into it. Then you lose it, you come back. You lose it, you come back.

Your understanding of right and wrong concentration, right and wrong mindfulness, becomes more refined. And so you can see yourself how it slides off into a wrong concentration or a wrong mindfulness very subtly. Then you correct it, it comes back to the right one. This is an ongoing process, cultivating a sensitivity to the balance.

CHAPTER 2

On Meditation Method

Patrick Kearney · 1h05

> *In this foundational dharma talk, Patrick Kearney offers a comprehensive exploration of meditation method from the perspective of the Mahāsi Sayādaw tradition. He begins by defining meditation as the systematic training of attention, distinguishing between awareness (the presence of what is present) and attention (the deliberate placing of awareness on an object). Drawing from the Satipaṭṭhāna Sutta (MN 10), he explains how this practice differs from object-focused methods by being defined not by a specific meditation object but by the quality of awareness itself.*
>
> *Kearney introduces the three fundamental activities in Mahāsi practice: noting (deliberately placing awareness on an object), naming (labeling objects to develop precision), and noticing (receptive awareness that allows objects to come to consciousness). He addresses common misconceptions about distraction, explaining that the movement of mind is not a barrier to meditation but rather its very content - the gateway to insight into the nature of mental processes.*
>
> *The talk covers the crucial distinction between grounding objects (where awareness rests and stabilizes) and secondary objects (everything else we become aware of), emphasizing that practitioners must find what works for their individual constitution rather than following a 'one true technique.' Kearney concludes with guidance on daily life practice and right effort (sammāvāyāma), stressing the importance of sustainable practice that can be maintained throughout the day without strain.*

This morning I want to talk about meditation method. I'd like to start from the beginning, exploring what we mean by meditation in the Buddhist sense.

Let me begin with some basic definitions. First of all, meditation is the systematic training of attention. Attention is the deliberate placing of awareness on its object, and awareness is the presence of the object. These are the basic concepts we're working with.

We start with awareness. When we do a meditation practice, this is essentially what we're working with all the time. For our purposes, awareness and consciousness are the same. Awareness is the presence of that which is present.

Think of it like light that illuminates a dark room. You step into a completely dark room at night and switch on the light. How do we know that there is light? Because we can see things. Suddenly the room and everything in it is present to us. Before we turned on the light, they weren't there. We switch the light on, and suddenly everything is there. The light makes the room and everything in the room present. Awareness is like the light—it's the presence of that which is present.

Awareness is not a thing. Right now, you are present to me. I can see you. But you are not awareness. Awareness is the quality of your presence to me. Awareness is tricky to grasp because it's not a something—it's a quality, the quality of presence.

When we work with awareness, we realize that we're always working with a basic dyad: awareness and what we are aware of. What is present and the presence of it. We're always experiencing and working with this basic dyad. A simpler way to say this is: when I am aware, I am aware of something. That something we call the object of awareness.

If I'm seeing, I'm seeing something. If I'm hearing, I'm hearing something. If I'm thinking, I'm thinking something. So that something we call the object of awareness.

Now, what I am seeing—let's say I'm looking at you—you are the object of my vision. You are not the seeing itself. The seeing itself is not you. But there cannot be that seeing of you without you. So they always go together, but they're not the same.

We're always working with this dyad: awareness and the object of awareness. That object doesn't have to be an object in the conventional sense—it could be a state of mind.

Here, that state of mind, we're calling it the object of awareness. So it's the object of awareness, but it isn't an object. It's not necessarily a thing. It might be a thing—we might say, "I'm aware of this, I can feel it"—but it might be something quite different. For instance, I'm aware of a subtle feeling of pleasantness because it's a really nice morning, mingled with anxiety because I'm teaching, plus the caffeine buzz from two cups of coffee, creating a certain itchiness to my feeling. So that's the object of my awareness, but it's not a something.

We're always working with this dyad: there's the awareness and the object of awareness. Or we could say there's the process of aware-ing and the object of awareness. There are always those two.

Now when you look at the way that we meditate—and you're all experienced meditators—if you examine different kinds of meditation practice, some methods emphasize the object and some methods emphasize the aware-ing. Generally with Mahasi, they emphasize the object. "Note the object. What is the object? Whatever object arises, you must note." If you've been to Burma, these are the standard instructions. Notice that the language is all about the object.

But you can't have an object of awareness without the awareness. So there's always the awareness. Other methods may say, "Look, I don't care what the object is. There is no object. Forget about object. Object is dualistic. We're not dualistic here. We are non-dual. We're much better than these dualistic people." That is a touch dualistic, but apparently we have transcended that. So there you often get an emphasis on the aware-ing itself rather than the object of awareness. It doesn't matter what I'm aware of. What matters is the aware-ing itself.

You find some meditation methods will emphasize the aware-ing, some will emphasize the object. But always there's both. You can't have one without the other. In practice, as one's practice develops, you go through periods where the object is what you're really focused on, but at other times it's really the aware-ing itself that you're focused on. You can move between one and the other, sometimes without even necessarily noticing that you're doing it, because the shift is quite subtle.

Can you be aware of the aware-ing?

Yes, that's another aspect of it.

So is that the object then?

Yeah, the awareness becomes the object. If you're speaking about this in Mahasi language, you'd be told, "Note the awareness." If you're labelling it, you might label it "knowing, knowing," or "aware-ing, aware-ing."

So this dyad is a structure more than a something. Any other questions? Are we making sense so far?

I'm not sure if what you just said is like a third thing, because you can be so lost in concentration that you're not aware that you're aware. It's only in hindsight that you're aware that you were aware. At the time it was like—I think that's a question of balance. It's like you've lost your balance.

This relates to the recursive nature of awareness itself, which we're going to be talking about, particularly when we discuss using mind as a meditation object. I think I've got this in here. I've rewritten this talk, so I'm not entirely sure what I've got in it. Let's raise these issues later on—they'll all come out and we can talk about them.

Often you do see a progression within one's practice. Usually when people begin, their interest is on the object of awareness. As the practice develops, people will find that the process of aware-ing itself becomes more interesting. That's often a pattern, though it's not necessarily the case.

One of the things that characterizes awareness is that it's completely natural. Whenever I look for it, it's already here. There's a book called "Ten Zen Questions" by Susan Blackmore. I don't know if you've ever come across it.

And every time she asked herself that question—having taken this inquiry quite seriously as a contemplative practice—the answer was invariably yes. If you try this for yourself, you'll likely discover the same response.

So awareness is completely natural and already present. We don't need to do anything at all to be aware. We are already aware.

However, there are degrees of awareness. We could say that awareness has depth. While I am already aware, I can be very faintly aware or very clearly aware, or anywhere in between. So though I am already aware, I'm not necessarily clearly aware.

This touches on something quite interesting. I can be in a meditative state in which I actually don't know what's happening. Sometimes as a teacher, you might observe someone sitting completely still in the meditation hall for two or three hours. When you ask them afterward what their experience was like, they simply don't know. They actually can't describe what occurred, which is fascinating.

If awareness has depth, this suggests it can be developed. I can move from being very faintly aware to being very clearly aware. But if I'm going to develop awareness, how would I do that? What's the mechanism?

The answer is attention.

This brings us to the whole question of attention. Awareness is the simple presence of knowing. Attention is the deliberate placing of awareness on an object. In other words, attention is the act of being deliberately aware.

It's rather like the difference between seeing and looking. I am already seeing—I don't have to do anything for this to happen. In fact, it takes considerable effort not to see. But looking is something entirely different. Let's say I'm expecting someone to arrive at this retreat and I'm not sure if they've come. So I begin to examine everyone in the hall to see if I can spot them.

When I'm simply seeing, I'm making no effort at all. But when I'm looking, I'm making an effort—I'm actively doing something, adding something to awareness.

The moment we bring in attention, we also bring in method. If I'm going to look, how will I look? If I'm searching for someone in this room, will I scan from front row to back row? From left to right? Right to left? Back to front? Or will I simply take in the whole room at once?

That immediately gives me five different methods.

I've already got five possibilities in how I could go about doing something as simple as that.

So when we talk about method, we're talking about the systematic training of attention—in other words, what we call meditation. All forms of Buddhist meditation are forms of attention training. I want to heighten, develop awareness. To do that, I will pay attention. And if I'm going to pay attention, I have to have some method by which I will do that. And there are multiple methods available. We quickly worked out five just for looking to see who's in the room.

These are the various meditation techniques that we're familiar with in the spiritual supermarkets. And I think it's really important to understand that there is no such thing as the one true technique, any more than there is any such thing as the one true washing powder. It just doesn't exist. But the marketeers will quite try to persuade you that it does. They will try to explain that all laundry powders wash white, but only one washes whiter than white. And that's the one you should be buying.

You get exactly the same phenomenon in the spiritual world. "Ah yes, meditation is very good for you, but only this one will get you enlightened. Those other ones won't." This kind of rhetoric is extremely common. And I think as meditators it's really important to understand that all of this is complete bullshit, total, from the beginning to the end. It's just marketing. That's all it is.

The job of the practitioner is not to discover the one true technique. The job is to discover and cultivate the method which is most suitable for that person—for me. That's your job. You have to discover and cultivate what method works for you. And it's not

necessarily the method that works best for the teacher. What the teacher is teaching is usually what worked for him or her. But that's not necessarily what works for you. So it's your job to find out what that is.

The particular approach that we're working in is that developed by and taken up by Mahāsī Sayādaw. When I was in Mahāsī Centre practicing with Sayādaw U Paṇḍita, where he gave his dhamma talks was in his drawing room at his house. And he had that image of Mahāsī Sayādaw up on the wall. One time we were sitting there waiting for U Paṇḍita to turn up to a talk, and a friend of mine who was sitting next to me breaks the silence and leans across and says, "Do you know that that photograph was taken just two days before Mahāsī Sayādaw died?" And I replied, "To me it always looks like it was taken two days after he died."

This centre teaches a method based upon Mahāsī Sayādaw. It's developed over the decades and changed, but it has its origins there. And that's important because basically what Mahāsī was doing—Mahāsī and other members of the insight meditation movement in modern Burma—they were part of a revival of meditation practice to make it widespread for lay people.

This is really important. From a traditional Buddhist perspective, the fact that there's a group of lay people sitting here devoting a month to intensive meditation practice is really, really weird. It's not normal in traditional Buddhism, any school of traditional Buddhism. Meditation was taken to be only for a monastic elite. Not even the majority of monks and nuns would practice meditation, much less lay people.

In the Buddha's time there was, we know, a flourishing lay meditation culture, but it died out. In nineteenth-century Burma they seriously started to revive it, and they were wildly successful. That's where we inherit our meditation tradition from, so it's quite significant. It began in the nineteenth century but flourished particularly in the twentieth, and especially after independence in 1948.

Let's look at the nature of attention. Attention has a certain structure. Awareness presents an illuminated field, like a room when the light is switched on. Imagine you step into a dark room, hit the light switch—bang. At that point, what do you see? Do you see the entire room? Light illuminates everything without distinction, and awareness is like this. Awareness illuminates the entire field.

What attention does is within that field, it chooses one specific thing or one specific direction as being of interest and concern, and directs its interest there.

That's what it looks like. And that specific something now becomes the centre of the field of awareness.

So I step into a dark room, switch on the light. For a moment the entire room is illuminated, but in that room is my favourite armchair, where I like to relax, read a book, drink a little something. Because I'm in Buddha's company, I won't say what it is that I drink. And have a good time.

So it doesn't take very long, maybe only milliseconds, before my eyes go to that chair. And I focus on it, and that chair becomes the centre of my field. And what's around it on the periphery actually disappears. Because I'm not interested in it. What I'm interested in is this. So much of the field drops away and all I've got is this. Does that make sense? That's how we normally operate within this field and this is what attention does.

So the chair is now at the center of my field and everything else is on the periphery. Or we could say the chair is now in the foreground and everything else is in the background. And attention has that structure. We foreground something, what we're interested in, and everything else fades into the background or maybe even completely disappears. So when we work with attention, that's the structure that we work with.

In the Mahasi lineage we speak of three basic activities and this provides the language that we're using in this retreat. The three basic activities are noting, naming and noticing.

First of all, noting. To note something is to deliberately place awareness on it, or to be deliberately aware, or simply to attend. I forget what the Burmese word is that was translated into the English "to note," but that Burmese verb simply means to attend to, to be deliberately aware of something. When they were translating into English, you could use "to attend," but there really is no English equivalent. So they picked up the verb "to note" to explain this. So to note something is to be deliberately aware of it. In other words, to foreground it. To put this at the foreground.

Then you have naming. This is putting a name or a label on this object. And the reason why this is done is to develop aim, precision, accuracy in attention. And accuracy is really important if you're practicing for the purpose of developing insight. If we're practicing just to develop serenity or concentration it's not particularly important at all. And if you look at methods of meditation that are primarily about developing serenity they do not use naming and often their advocates will dismiss meditation methods that use naming. "That's ridiculous. Why are you making all these words up? They just get in the way. They're at best useless. The best you can say about it is it's completely useless."

Now, from their perspective, they're right. The problem is it's completely useless if you're just practicing for serenity. Because you don't need to be all that accurate. What you need is to be peaceful. But if you're practicing for insight, you need to be accurate. You need to be precise. So the naming can be useful.

And the naming can take different forms. It can be very brief. Let's say thinking comes up and you want to name it. You could name it simply "thinking." Or you could give it a longer name which tells you something about its nature.

You could say to yourself, "A thought is just a thought." That too is naming—simply doing it in a different way.

The name could even be a question: "What is this?" Or a more dynamic question would be, "What feeds this?" We'll be talking about this one later in the retreat—it's a very useful question. If you use a question, the question is always much more important than any answer you come up with. The answer is not particularly relevant; the question is important. A good question sends the awareness directly to the center of what's going on. In other words, a good question stimulates aim.

So this is the whole area of conceptualizing the experience in order to more effectively aim your awareness at it. You have noting, naming, and finally noticing.

Now, noting is to be deliberately aware of something. You go out to the object. Naming assists the noting, and you may or may not name. Some people use naming a lot, some people never use it, some people use it a little bit. You find different patterns. But noting has this quality of being active and directed.

Noticing is the exact opposite. Noticing is receptive and undirected. When I note, I send my awareness to the object. When I notice, the object comes to me. All I do is receive it. I'm not doing anything at all. It's coming to me.

This is, in a very mundane sense—if you go to a meditation retreat, you invariably get the cautions about how you should behave: move slowly and mindfully, don't make any noise when you come in and out of the hall, and so forth. The forms of behavior in a meditation retreat are quite explicit. You've got to behave very carefully. When people come to do their first meditation retreat, often this strikes them as being a bit weird. They think, "What sort of weird place am I in?"

But after a few days, you begin to realize why this is important. One example is the meditation hall clock phenomenon. You come into the hall and notice there's a nice big clock on the wall. You think, "Oh, this is good, because now I can tell the time, so I know when I can get out of here." And mercifully, the clock is silent. So everybody starts to meditate.

After a couple of days, you realize it's not actually silent. It does make a little bit of noise. And a couple of days after that, it's driving you crazy because it's so noisy. Have you ever had that kind of experience?

What's happening is the noticing is getting stronger and stronger and stronger. Noticing is all about sensitivity. The mind becomes increasingly sensitive and notices more and more. It's not that you're looking for the clock—the clock's finding you. This is noticing. It's the receptivity associated with sensitivity and the power of the mind as it develops, as meditation develops. But it is essentially receptive. It doesn't do anything.

Again, some styles of meditation work with noticing much more than noting.

So, for example, here's a very interesting meditation exercise: come into the hall, sit down, and for the next hour do nothing. Don't do anything at all. It's a really interesting exercise because you discover how difficult it is to not do. But that would be an exercise in noticing rather than noting.

In another exercise you might come in and say, "OK, for the next hour I'm going to track my breathing, I'm going to follow the breathing." That's noting. That's active. You're going out to it. Does that make sense? And sometimes you will find yourself quite spontaneously moving from one to the other.

So that's about the nature of attention. Then we can talk about the objects of attention. If there's attention, there's something we're being attentive to. This is the object. And we talked about this as when we are aware, we are aware of something.

Most meditation methods are defined by their object. So, let's say anapanasati, mindfulness of in and out breath. If you're doing breathing meditation and you do it, let's say, for one hour, and at the end of the hour you reflect, "Well, how much of that hour did I actually spend paying attention to breathing?" And you might think, "Well, maybe twenty minutes if I was lucky." Then were you doing breathing meditation for the other forty minutes? No. Because by its very nature, it's about the object. So if you're not focused on the breathing, you're not doing breathing meditation. Simple.

So you get forms of meditation which are defined by their object: breathing meditation, mantra, sound, visualization, visual object—real or imagined, and so on.

The style of practice that we're doing is satipatthana. You could translate that as the applications of mindfulness. And what characterizes satipatthana is that it is not defined by its object. The basic text which we'll be looking at for satipatthana is the Satipatthana Sutta, and that gives a whole range of objects—basically anything in the body and anything in the mind. In other words, anything. This style of practice is not defined by its object, and this creates a whole different dynamic to it.

However, you do find, when we talk about the object, what Mahasi talks about is two categories of object: the grounding object and the secondary object. Usually this first one, the grounding object, is translated as primary object. The original Pali is mula aramana. Aramana is object and mula literally means root, so it's literally the root object—but root in the sense of where we stand, where we're connected, so the ground where we find our ground. So I prefer to translate it as the grounding object. In other words, if we're doing a meditation practice and we're going to cultivate awareness through practicing attention, we need to ground our awareness somewhere. We have to allow it to rest in one place and let it become still. Let the mind become still.

Now anybody who starts a meditation practice quickly discovers that the normal state of the mind is to restlessly chase after one thing after another. So one thought or sensation after another thought or sensation. And the mind restlessly moves around looking for a satisfaction that it never quite achieves, so it keeps moving.

And this quality of restlessness is immediately evident to the meditator, and it manifests in what we call, in the context of meditation, distraction. Has anybody ever experienced distraction? Just once. I'm sure it was a long time ago, before you overcame it.

And when we call it distraction, we pile all these concepts on top of this experience. And often we see it as what prevents our meditation practice. Have you ever had the feeling that if only this would stop, then I could start meditating? Well, this is distraction.

But if we're going to practice any kind of meditation, we need to stabilize the mind. Which means we need to be able to keep our awareness in one place over a period of time. And this is the function of the grounding object.

This is what it's for. The grounding object provides a place for our awareness to rest and to remain still over a period of time. In a sense we could say that the grounding object is where our awareness feels at home—where our awareness will remain unless it has a specific reason for going somewhere else. This is the grounding object. And you notice that it's basically a function, not a thing.

So what do we use as our grounding object? Now if you take up a particular meditation technique—we could call these "off-the-shelf" techniques—you unwrap the packaging and you're presented with your grounding object. In the case of Mahasi Sayadaw, he presented what he calls the rising and falling of the abdomen. This is breathing sensed in the abdomen. This is actually very controversial in Burma, but we won't go into the reasons why.

The reason why he presented this was because he thought that for most people, most of the time, breathing here is clear and obvious—therefore it's suitable as a grounding object. Because if you want to rest your awareness somewhere and to keep it there, the basic qualification required is that this something, whatever it is, is clear and obvious to you. If you've got to go searching around for it, it's not going to work, because you're already restless just looking for it, not to mention restless trying to hold on to it if it's not suitable for you.

When Mahasi chose rising and falling of the abdomen, he did not choose it for esoteric, mystical, and yogic reasons. When I started doing Mahasi practice, I was quite used to this because that's what we did in Zen. I practiced Zen for a number of years before coming to this tradition, and that's where I was trained—tracking the breathing there. And there they have all sorts of reasons why you do this. In Japan it's called the hara. In Chinese it's the dantian. This is a major center of energy, important in martial arts, connected with the chakras—a major chakra area, and so on and so forth.

Now, as far as I'm aware, Mahasi Sayadaw either knew nothing about all this, or if he knew anything about it, he didn't care. He chose this for purely pragmatic reasons. For most people, most of the time, it's clear and it's obvious, so just do it.

But for some people it's not clear and it's not obvious. Some people find it very difficult to find this movement, much less to maintain it. Some people find breathing a difficult meditation object. And breathing itself is not, for a certain proportion of the meditating population, a suitable grounding object. It's always been difficult for me. I've had lifelong asthma, bronchitis, etc. Breathing's always been problematic for me, and I've always struggled with it as a meditation object.

So we want to ground our awareness, and the easiest way to do this is through some aspect of body or mind that we can easily find and which is clear and obvious to us. It also helps if this object is either still, or if it moves, then it moves rhythmically—which is another reason why people like breathing as a meditation object.

It's up to you to decide what your grounding object should be. Most of you already have yours. You're experienced meditators. You've probably pretty much settled on what your grounding object is. But notice that it's about function. And the grounding object itself can change over a period of time. What you were used to in the early stages of your meditation career—"OK, I can settle on this, and it works"—it may be that later on it's no longer suitable and you focus on something else. Don't fight it. Just ask yourself what's clearest and most obvious. Go there. Because that's what you want for a grounding object. Where can I most readily rest my awareness so that the mind will remain relatively still over time? This is my grounding object. This is what my awareness will call home.

So that's grounding object, and then we have secondary object. The mind moves and

When we do this practice, we are not trying to prevent the mind from moving. The mind moves. That's what it does. What we're trying to do is to understand that the mind moves and how it moves. It's the understanding that's important, not the movement. And this understanding of the movement of the mind is the gateway into insight, for reasons that we will talk about later on.

This brings us to this tricky question of distraction. The mind moves and we feel that we can't meditate because the mind is moving. If only this would stop, then I could meditate. If only I was not distracted, then I could meditate. Have you ever thought like that? No, not these meditators. Other meditators have thought like this.

But this idea is a complete delusion. The delusion, the mistake is twofold. First of all, it mistakes the nature of the mind. The mistake is thinking that the uncontrolled movement of the mind is a barrier to meditation, rather than realizing it's the content of our meditation. It's the moving mind that we are studying. And if it didn't move, we couldn't study it.

The power of the meditation practice comes from the insight it gives us into the nature of the mind. And the nature of the mind is revealed through the way it moves. If the mind did not move, we would be in deep trouble.

Imagine the horror. If you walked into this hall after breakfast, let's say after the practice workshop, you check your watch and think, "Okay, lunch is at 12:15. Let me arise from my samādhi at 12:15," and you then entered into a deep absorption state in which the mind was completely still and completely peaceful and blissed out. And at exactly 12:15 you emerged from that and ambled up and had lunch. Imagine how terrible that would be. Because in the course of those several hours, what would you have learned about the nature of mind? Nothing, basically.

The movement of the mind is the gateway into insight. So if you're meditating for serenity, of course, that's what you want. You want to be blissed out. But if you're meditating for insight, you want to study the movements of the mind. So distraction is your ally.

The second aspect of delusion is about the nature of distraction itself. We don't even know what it really is. Distraction is not found in the movement of awareness from one object to another. Distraction is the unnoticed movement of the mind from one object to another. The fact that the mind moves is completely natural and is not a problem. Distraction occurs only when we don't notice the movements. When we are aware of the mind moving, we are not distracted.

We'll talk more about the nature of distraction when we talk about mindfulness. Just for now, notice that as soon as we know that we are distracted, the mind has already landed and we are already meditating. If I think I'm distracted, that means I'm already meditating. Because I'm aware of where the awareness has landed. And so I'm not distracted. I'm simply noting my secondary object.

This is what we call the secondary object. The secondary object is everything that we are attentive to which is not the grounding object. So as soon as I know that I'm distracted, I am no longer distracted—I am noting the secondary object. The relationship to the secondary object is really important because, at the most broad brushstroke level, grounding object gives us serenity. Secondary object gives us insight. So it's very important.

Do not fight distraction. Study it. That's the crucial bit.

In terms of the basic method, I like to sum it up as: firstly, settle awareness in the body and then see what happens. So the body is the grounding object. It's the first satipaṭṭhāna. And for a variety of reasons, which we'll get into, the body is really suitable as a grounding object. Now, it may be the whole body—for example, the whole posture, as you sit or stand or whatever. Or it may be some specific aspect of the body, such as the details of the breathing.

Or it may be the sensations you feel at the base of the body, or the sensations combined with the breathing—whatever works for you. There are different approaches you can use, but essentially you ground awareness in the body and do this consistently. Then see what happens.

And what will happen—I'll let you in on the secret—is that the mind will move. And wherever it moves to, that becomes your secondary object, regardless of what it is.

So we have formal meditation practice periods in the four postures: moving, standing, sitting, and lying down. We'll explore this more as we progress through the retreat. Then we have all the rest of the day when we're not doing formal meditation practice, and this is what we call daily activities.

Now, the daily activities practice is actually the most important practice. One way of looking at this retreat is that we're going to fill up the empty hours—we're going to give ourselves something to do. So we'll engage in these formal meditation practices, but we're doing that primarily to prepare ourselves for the real practice, which is the ordinary daily activities when there is no formal meditation practice. This is the central one.

And it's central because when we leave here and go home, that's the practice we'll be doing. This retreat is our chance to actually get to know it.

In the daily activity practice, this is by and large a general awareness that does not focus on specific details most of the time, but simply lets things flow. It's interested in what is happening in all six senses: seeing, hearing, smelling, tasting, touching, and minding. It allows things to happen—it doesn't suppress anything, but nor does it get entangled with anything. It's like keeping a balance in the mind.

When we notice ourselves falling into something, getting entangled in something—either physical or mental—then we relax and simply notice what's happening. Not a big deal. We are not trying to make something happen in this daily activity practice.

Let's say I'm sitting and I'm following the breathing—I'll use breathing as the generic meditation object. In formal practice, I'm trying to make something happen. I'm trying to stay on the breathing for as long as I can. In the daily activity practice, I'm not trying to make anything happen. I simply want to know what is happening. That's all.

You notice the distinction? The second approach—I just want to know what is happening—is less focused and involves less effort and no strain. And from this, sampajañña, clear understanding, naturally arises.

Any questions or comments? Has any of this made sense?

[Noticing a thumbs up gesture] I've got the thumbs up of approval.

[Participant responds about strain and work stress]

That's quite interesting because from the last retreat to this, I was actually trying to do that at my work. It's very stressful and moves very fast. I was trying to be aware of what's happening without trying to make things happen, and it's had a really good effect on me. I'm less stressed at work. It's just keeping it there. The tendency I find is to

grab onto it and actually push it, for me at least. I tried to stay out, and it was really beneficial because I realized that things were happening anyway, and they were actually happening in a good way. I didn't need to do quite as much as I usually do.

So that's more the noticing rather than the noting, in terms of what we were talking about earlier. This brings in the question of right effort—what the Buddha calls sammāvāyāma, right effort.

If you're doing a project where you meditate for thirty minutes or one hour, then you can put in a lot of focus and effort because you know that at the end of thirty or sixty minutes, you can stop and take a break. But as we'll discuss throughout this retreat, this practice is satipaṭṭhāna. And the Buddha says you do this from the moment you wake up in the morning until the moment you fall asleep at night.

Now, if you're attempting that with a lot of effort, there's no way you can do it because you cannot sustain it. So what you're looking for in this style of practice is something you can sustain—a relationship to effort that you can maintain throughout the entire day.

Since effort is like finding the right string tension for music, it requires careful attention to the mind's quality and flavor. Notice if there's grasping—that subtle demand for the breath to deliver concentration, which turns meditation into a form of bullying. Wrong effort manifests as strain followed by collapse, a familiar cycle that signals imbalance.

This dynamic extends beyond formal practice into daily life. One practitioner shared how concentration without awareness led to complete absorption while reading, resulting in physical injury—classic signs of wrong samadhi, concentration out of balance. The pain served as a wake-up call, stimulating mindfulness that had been absent during the intense focus.

Physical posture becomes a valuable teacher here. The body reveals the mind's state with remarkable accuracy. Developing sensitivity to posture cultivates awareness of mental conditions, creating a feedback loop that supports balanced effort throughout the day.

This is why mindful attention to how we sit, stand, and move matters deeply. The body's wisdom guides us toward the harmonious effort that sustains practice from morning until night, helping us recognize when we're pushing too hard or sliding into dullness, when we need to engage more fully or relax more completely.

And then intention. This is likely to be interesting when you're sitting in a chair, so watch it.

A participant asked about the translation of *sampajañña*. Clear understanding, yes.

Another question arose about method and meditation objects: "I think it's interesting that for people who have been going through different traditions and have different objects... I sort of knew there was no right or wrong thing, but sometimes it just happens that there is no object. What I tend to do is focus more on the events themselves. So if your object is awareness itself, do you just let whatever comes up roll along and then forget it?"

Usually people find that relatively difficult to maintain unless they've already built up some momentum. Every approach has its shadow, and the shadow of that approach is that the mind can easily get lost and start to drift without even noticing that it's drifting.

If you notice that happening, come back and ground yourself somewhere more solid. Usually the body is the best place to go—it could be simply the posture, physical sensation, or breathing. Ground yourself in the body and then go back to just opening up.

It's like you're holding your meditation object and then you relax your grip a bit. This has a quality of effort involved. If you just relax your grip and let things move in and out, and you start to get lost, hold again. You find yourself moving from one to the other.

Another question came about the second object—noticing the movement of the mind: "Are you talking about where the mind is going, the object it's seeking, or the quality of attention, the quality of relationship to that object, or both?"

All are possible. In my experience, noticing the object is easier, so that's where I would start. But as I develop momentum, I might become much more interested in and aware of the quality of the awareness itself and what's behind that movement. Where is it coming from? What's feeding it? You could also ask what it's feeding.

Both of these questions are designed to expose the workings of dependent arising. This is always process, and we're tracking the process. Work with what's clearest and most obvious.

The practice at the beginning of a retreat will be different from how it becomes in the middle and how it will be at the end. Always work with what's clearest and most obvious. Other things that are more subtle will come to you—you'll start to notice them. You don't need to chase after them; they'll come to you.

It's important that you don't have a very blinkered approach to concentration, where you're so focused on one thing that you blinker out everything else and miss a lot. You want to be able to be grounded on something but have a sense of awareness of what's around it, so that when something happens, ah, there it is.

Good luck.

But it's important that you don't have a blinkered approach to concentration. Some people become so focused on a single object that they actually block out everything else and miss a lot. Instead, you want to be grounded on something while maintaining awareness of what's around it. This way, when something arises in your experience, you can recognize it clearly: "Ah, there it is."

This balanced approach to concentration allows you to remain stable and focused while staying open and receptive to the full range of your experience. It's this quality of mindful awareness that transforms meditation from mere concentration into wisdom practice.

Good luck with your practice.

CHAPTER 3

The One-Way Street & Nibbāna - Introducing Satipaṭṭhāna

Patrick Kearney · 1h04

> *In this opening talk from a month-long retreat, Patrick Kearney introduces the foundational practice of satipaṭṭhāna by examining the opening passage of the Satipaṭṭhāna Sutta (MN 10). He explores how the Buddha describes the four applications of mindfulness as "ekāyana magga" - a one-way street leading inevitably to nibbāna for those who persist in the practice.*
>
> *Kearney offers a nuanced understanding of nibbāna, distinguishing it from mere extinction and explaining it through two dimensions: cognitively as reality no longer defined by concepts, and affectively as the natural extinguishing of the fires of clinging (upādāna). Using vivid analogies - from fairy tale endings to the relationship between menus and meals - he illustrates how our conceptual frameworks shape experience and what it means to live beyond their limitations.*
>
> *The talk addresses common misconceptions about Buddhist practice, contrasting the Buddha's ultimate aim of liberation with more conventional goals of happiness and comfort. Through practical examples of body awareness and the nature of physical tension, Kearney demonstrates how deeply our concepts penetrate even our most basic experiences, and how satipaṭṭhāna practice cultivates a clean, direct relationship to present moment experience.*

Tonight I'd like to introduce the practice that we engage with in Satipaṭṭhāna, the way I normally approach it, which is to begin by examining the Satipaṭṭhāna Sutta.

Any kind of Buddhist meditative tradition is based on the teachings of the Buddha, and these teachings are found in the suttas. There are different discourses that address meditation, but there are two major meditation discourses: the Satipaṭṭhāna Sutta and the Ānāpānasati Sutta. Ānāpānasati is mindfulness of in-and-out breathing. This tradition we practice is based on the Satipaṭṭhāna Sutta—it's the root text. All of the modern Satipaṭṭhāna meditation methods go back to this discourse and its associated teachings.

Satipaṭṭhāna is variously translated. Older translations rendered it as "the foundations of mindfulness." Now you see translations like "the establishing of mindfulness" or "applications of mindfulness." Perhaps later we'll discuss why there are different translations, but for our purposes tonight, the main thing is that at the center of it is sati, which we explored last night.

Sati literally means memory, from the verb sarati, "to remember." It was translated as "mindfulness" by T.W. Rhys Davids, who first used this term in 1881. Different translators experimented with various terms, but by 1911 or thereabouts, "mindfulness" had become the accepted translation. We discussed how it fits quite well—when we talk about "minding" something, we mean to watch the store, look after it, don't wander away from it, keep your eyes on it, make sure you know what's going on. Essentially, it carries the same meaning. We explored last night the phrase "mind the gap," the sign in railway stations—remember that there's a gap when you step in and out of the train. So the translation definitely works.

When this discourse opens, the Buddha declares: "This way, the four applications of mindfulness"—here I'm translating Satipaṭṭhāna as applications of mindfulness—"is a one-way street for purifying beings, transcending sorrow and distress, vanishing pain and grief, attaining the right path, and realizing Nibbāna. What are the four?

"Here a bhikkhu, surrendering longing and sorrow for the world, lives tracking body as body, ardent, clearly understanding, and mindful. Surrendering longing and sorrow for the world, he lives tracking feeling as feeling, ardent, clearly understanding, and mindful. Surrendering longing and sorrow for the world, he lives tracking heart-mind as heart-mind, ardent, clearly understanding, and mindful. Surrendering longing and sorrow for the world, he lives tracking phenomena as phenomena, ardent, clearly understanding, and mindful."

This is the uddesa, the introduction to the discourse, and it essentially summarizes the entire teaching.

First, it begins with evaṃ me sutaṃ, translated here as "this is how I heard it," though usually rendered as "thus have I heard." All suttas begin this way, reminding us that this is an oral tradition. Oral traditions work differently than literary traditions. We are accustomed to being shaped by literary tradition, and we're moving into yet another kind of tradition with the internet—more of a screen-based tradition whose implications we don't yet fully understand.

In an oral tradition, everything is based on memory. Information comes through the ear and ultimately flows from the mouth. Everything is spoken, recited, sung—and particularly sung. These suttas, when we approach them as texts and read them (or at least don't read them because they can seem extremely tedious), are actually songs, meant to be performed in chorus. We miss much when we simply read them.

There's a certain rhythm in the discourses, particularly found in the patterns of repetition. Here we have one sentence repeated four times about the bhikkhu. Bhikkhu here means a committed practitioner. The legal definition of bhikkhu is "fully ordained male," or monk. But the essential meaning of bhikkhu is any committed practitioner—ordained or not ordained, male or female. I like to emphasize this point, and I want to stress that this is not a New Age reinterpretation. This is the ancient tradition. In fact, there's even a reference for this—Dhammapada, verse 142. Look it up.

So this discourse is addressed to all committed practitioners. It's addressed to us.

So here a practitioner surrendering longing and sorrow for the world lives tracking body as body, feeling as feeling, heart-mind as heart-mind, phenomena as phenomena, ardent, clearly understanding and mindful.

This passage is repeated four times throughout the discourse, and the thing about repetition is that repetition shows us what's important. For a start, if you're chanting this, what you repeat the most goes deepest into the memory banks and simply becomes part of you. And secondly, if it's repeated extensively, you know this is important—this is what you must pay attention to. So we're going to examine this particular sentence closely.

The discourse was given when the Buddha was living among the Kurus, near the market town of Kamasadhamma. We have absolutely no idea where the market town of Kamasadhamma is, but we do know where the Kurus lived. The Kuru country is roughly the area south of modern Delhi. So the Buddha lived and worked in the Ganges plain, in an area extending from the southeast—roughly on the border of West Bengal—up the valley to the area south of Delhi, the Kuru country. And it was in the northwest that he gave this and several other important teachings.

The Buddha describes this way of practice—the four applications of mindfulness—as a one-way street: *ekāyana magga*. He then outlines a series of progressive attainments: purifying beings, transcending sorrow and distress, vanishing pain and grief, attaining the right path, and realizing Nibbāna. This is a one-way street to Nibbāna, and this is how the Buddha introduces it. It's quite a powerful teaching.

Mindfulness is, as we've discussed, very popular these days through the secular mindfulness movement. The purpose of mindfulness practice in the secular context is basically to reduce suffering. You could say it's designed to take people from clinical levels of sorrow, distress, and depression, and bring them into normal levels of sorrow and distress. But the Buddha doesn't say this. He says this practice is actually for Nibbāna.

I like to talk about Nibbāna, though I was told long ago—and have been told a few times since—that this is not a good idea. Initially, I agreed it wasn't a good idea because it's such an impossible subject to grasp and therefore impossible to talk about. But the reason why it's not a good idea, I was told, is because no one's interested. People just want to be a bit happier. That's why they come to meditation centers and do meditation courses. No one out there is interested in Nibbāna; best not to mention it.

I wouldn't argue with that observation. However, I would argue with the idea that this is something new. Throughout Buddhist history, most people have not been interested in Nibbāna. Most traditional Buddhists in traditional Buddhist societies had no interest in Nibbāna. It's there, kind of floating around somewhere, but that's not really what they're interested in. What they're interested in is having a good life this time around, and then getting a good rebirth—a nice rebirth in heaven, or if you're a woman, getting reborn as a man, which is obviously much easier.

This is, you could say, secular mindfulness. It's basically the functional equivalent of practicing mindfulness because at the moment—and for some time—you've been feeling pretty miserable, but you want to feel much better. When you feel much better, you can get a nice job, make some money, drive a nice car, build a reasonable superannuation account, and have a comfortable life.

If you have that kind of motivation, then basically what you're saying is: I have an idea from current experience of what happiness looks like, I want that, so I'm projecting my view of what would make my life nice now into the future, and that's what I want. That's essentially what the ambition is. In a traditional Buddhist society, if you say you want a nice rebirth, it's essentially the same move. It's projecting what you think happiness is now into the future—it's just that their sense of time is a bit different. But it's basically the same move.

If you look at advertisements for superannuation, it's basically heaven for old age. You see these ads where people are old but incredibly happy. There was one favorite I used to see at a railway station: an old couple on a tropical beach, both with fixed grins

on their faces, one holding up a cocktail. Clearly this is meant to convey paradise—a kind of heaven realm which you can be reborn into if only you accumulate enough superannuation.

Most people have always been interested in this kind of heavenly rebirth. If they undertake some kind of practice, for most people that's what they're in it for. Only a few people are seriously in it for Nibbāna.

And it's a really weird ambition to have because for a start we've got absolutely no idea what it could be. Like none. If we have an idea of what it is, we're wrong. Because all we're doing is taking some attachment that we have and projecting it into the future. So it actually is very good advice not to talk about Nibbāna.

But the border is quite clear. This is what it's for. So we'll talk about this.

But first of all, the relationship between the practice and Nibbāna—he says this is a one-way street that leads to Nibbāna. Now this is a very strong statement. If I'm heading down a one-way street, and at the end of that street there's a destination X, then if I keep going, I will get there. There's no room for doubt. I will get there. I might dawdle, I might take my time, I might be distracted by the pub just down on the left, or the department store further along, but if I keep going, I will get there.

And this is the relationship that the Buddha says that Nibbāna has to this practice. If we do this practice, we will, like it or not, want it or not, eventually get to Nibbāna if we keep doing it. So this is the relationship that I'm interested in looking at tonight.

So first of all, what is Nibbāna? The word itself comes from nirvāti, to blow out, to extinguish. We'll get to that. Nibbāna represents the ultimate goal of the practice, the goal beyond which there is nothing more to be gained and also nothing more to be said. It's like one academic of Buddhism compares it to the full stop at the end of a story.

He points out that if you read European fairy stories, you have this incredible drama with the prince and the princess and the wicked witch and the evil stepmother, and they're all getting entangled and all these things are happening. Kitties are being baked in ovens and wolves are attacking ladies dressed in red and so on. But eventually the story comes to an end where hero and heroine get together and the final sentence is "and they lived happily ever after." And at the end of that sentence there's a full stop.

Nibbāna is the full stop. In other words, it's the end. That's it. The story is over. And it's complete. And now at that point, the full stop itself has no meaning. But that point of stopping is what gives meaning to everything that comes before it. Now we can look back and say, oh, that's what it was all about. It was all heading to this. And it's meaningless to talk about anything that happens next.

So let's say if you're reading a fairy story and you go through all the dramas and the prince and the princess finally get together and they lived happily ever after. Full stop. And you feel very satisfied. But you notice there's another page. So you turn the page. And then there's another chapter, and it's called "Ten Years After."

And it turns out that the prince is now the king, and he's incredibly bored with his wife. And she's got half a dozen children, and she's being driven crazy by them, especially since some of them are complete spoiled brats—I mean, they are princes and princesses after all. The king has been chasing other women. Plus he's been getting into the liquor and he's turned into something of a tyrant, and his aristocracy are muttering among themselves and they're sharpening the knives. And the queen is just not only completely fed up with him but really worried about what's going to happen if they really do assassinate the old bastard. And whenever they do meet on state occasions, which is rarely because the king tries to avoid it as much as possible, they invariably have embarrassing fights in front of everybody. And the whole thing is a complete mess.

And you're reading this and you cannot help but feel a certain degree of disappointment. It's like it should have ended back then. Well, try to work out, okay, Nibbāna, so then what? It's making the same kind of move—it just doesn't work.

When Europeans started to study Buddhism, they thought Nibbāna meant extinction. In other words, death. And they thought of it this way. They thought, look, Indians, including Buddhists, especially Buddhists, believe in life after life after life after life.

When you have Nibbana, you don't have any more lives. What does that mean? Well, it means you actually die. So life is suffering and the only way out is death. And that view was propagated by a lot of early scholars and there's still ripples of that early view that you come across.

But Nibbāna is not extinction. It's the going out of a flame. It has two levels of meaning. One is cognitive and the other is affective. So you could say head and heart.

In terms of cognitive, Nibbana is not extinction. It's reality no longer defined by concept or narrative. Life lived beyond the limits of concepts. Now we touched upon this already. So we talked about the relationship to the body. And we talked about how

our relationship to the body is governed by our concepts about the body. So we don't actually experience the body. What we experience is our concept of the body. This is my body, and it has certain characteristics. This is what it can do. This is what it can't do.

And in bodywork, it's really interesting to see how deep these conceptual layers go. So, for example, if someone who has trouble sitting cross-legged, and in fact doesn't sit cross-legged because it's too painful, was asked, why don't you just sit cross-legged on the floor? And they might say, well I can't, meaning my body cannot. And they're saying a simple physical fact. My body does not have the flexibility required to sit cross-legged on the floor. Physical fact, that's it.

Apparently, it doesn't matter how tight a body is, if someone's laid out on the operating theatre, and let's say they're so tight that they can't even lay on the theatre, they have to be supported when they first lay down, if they're given the anaesthetic, the muscles relax and they're completely flat on the table. Not only that, but doctors or nurses could move any limb to its full degree. They could put an old person who's completely stiff into a full lotus position without any trouble whatsoever. The body has no problem doing that at all. Zero.

When the person comes out of the anaesthetic, all the old patterns of tightness return as they come back into consciousness. The reason why I cannot sit comfortably on the floor in full lotus isn't because of this. It's because of this. It's the mind, not the body. And this is weird. This is seriously weird.

But when you notice the way that we're doing the body work, basically what we're doing is we're persuading the mind that it's okay, you can do this. We're basically talking ourselves into it. Move into the stretch. Find the point of resistance. Stop. Breathe. Relax. Why relax? It's the mind which is tensing up. Because the body hasn't been put into this position for a long time, and so the mind has decided it can't. So what our job is to persuade it that actually you're wrong. We can. But it takes time to persuade. But it's basically just persuading the mind. Get yourself a new concept. That's all.

Another way of looking at this is you could ask what's the physiological difference between a muscle which is really tight and the same muscle which is completely flexible and loose. The physiological difference is precisely zero. There's none, whatsoever.

The difference is entirely in the mind. This is a fascinating illustration of how deeply concept permeates human existence. Our very physical world is a product of concept. The body we inhabit is a product of concept.

Then of course we have other manifestations: our relationship to thinking, who we think we are, what we think this situation is. Why is thinking so addictive? Why can't we simply drop it? Why do we persist in generating stories even when they're incredibly painful? Even when we know exactly how they're going to end because we've told ourselves this story twenty thousand times before. Why? Why is it so difficult?

The relationship to thought is very interesting, and we're going to explore this more deeply during the retreat. It's really intriguing because again it illustrates how profound the clinging to concept goes—the absolute determination to believe that this is who I am, this is who you are, and this is what the situation is. Absolute determination. And under no circumstances will we allow this to be challenged.

So what would it be like to live in a reality which is not defined by our concepts? Or to look at it another way, what would it be like to live in a world where we don't cling to our concepts of things? What would that be like when we don't mistake our concept of reality for reality, when we recognize that reality is actually something different?

This is quite interesting. When we live in a world of concept, notice that concepts tend to be permanent, or at least long-lasting. I have a concept about something or someone and it remains stable. Concepts tend to be fixed and they also have very clear borders. For example, I know what's good and I know what's bad. That's it.

When we practice, when we experience through concepts, the experience itself tends to be quite hard and quite rigid and quite clear-cut and usually very familiar. When we drop the concept, we find that experience is a lot more fluid and in a sense mysterious—mysterious not in the sense that I don't know what it is, or rather not in the sense that it's not clear. It's quite clear, but in fact I don't know what it is. That is, I can't pin it down conceptually because it's already moving, it's already becoming something else. And as soon as I reach out and try to pin it down, it slips away.

We talked about this in relation to the experience of pain in meditation practice. Some people really like to use pain as a meditation object because when we do it correctly, pain itself disappears. And what we have is this flowing stream of physical sensation and a closely associated flowing stream of mental responses. But we don't have pain anymore.

It's interesting if you go through an experience like that where the pain dissolves, where you cannot—there's something, it's there, something is there—but I can't actually identify it as being pain. And certainly not my pain. And yet before, it obviously was my pain. And when it was my pain, the world was quite clear-cut to me. I knew what I

could do and what I couldn't do. But now, I don't know, because there's just this cascading flow of experience and I quite literally don't know what's going to happen next. So I'm not in a position to put a judgment on it.

When we have these kinds of experiences, we're getting a sense of what the Buddha is talking about when he speaks of nibbāna—because he's talking about a life lived which is not dominated by our concepts of things. The concepts no longer get in the way. The relationship to what's going on is not interfered with by the concepts, and we get a taste of that when we practice.

The Buddha also talks about nibbāna in the affective sense, the heart sense. In fact, mostly when he's talking about nibbāna, he'll speak of it in this affective sense. Some of the technical terms that the Buddha uses are essentially cognitive. For example, he talks about delusion. Delusion is a problem, and the counterpart or the opposite of delusion is wisdom. So we should develop wisdom and get away from our delusion or our ignorance. Both of these are cognitive—they're up here.

Whereas the Buddha will also talk about the problem in terms of what he calls taṇhā—literally thirst, or usually translated as craving. This is in the heart. It's not cognitive; it's something in the heart. Nibbāna is a term that belongs to the heart, normally.

It's an affective term. And this is where you get the image of the going out of a fire. The Buddha uses the image of fire, and of course this is the ancient Indian context where he lives in a country which in summer is extremely hot. Fire conveys an image of heat at uncomfortable levels, and restlessness. Fires are always moving. So pain and restlessness—these are the images presented by fire. But also fascination. You know how pleasant it is to look at a fire because it's constantly moving and dancing. So it's fascinating, but it's painful and it's restless.

Now, if we ask: What defines a fire? How do we identify a fire? Because fire is fire is fire is fire—it's always the same. But we can identify different kinds of fire, and we identify them on the basis of their fuel, what feeds them. So we say this is a bushfire, that's a gas fire, that's a house fire, and so on. What limits a fire? Well, it's fuel. It can't go beyond its fuel. If a fire can't move to the next bit of fuel, then that's it. It's all over. What does a fire cling to? Its fuel. What feeds it.

So this is the image that the Buddha uses, and the terminology—because he's speaking in Pali, people listening to him get a pun that we miss. The word for fuel in Pali is upādāna, and the word for clinging or attachment is upādāna. It's the same word.

Now, in English, if you study Buddha Dharma, you know that clinging and attachment are very bad things indeed. And you should stop doing it, otherwise you'll go blind. Or worse. And this teaching can cause a certain amount of confusion. Because if you think about it, what is a human life without attachment? Psychopathology. I mean, someone who's not attached has got serious problems, let's face it. So it seems a bit weird that the Buddha doesn't like attachment. But of course the Buddha's not talking about what we mean normally when we talk about attachment. He's talking about something else. He's talking about what fuels, what feeds something.

If you think about the match—I strike a match and hold it up. What's feeding the fire? It's the match. It's the matchstick. Looked at from the other perspective, what is the fire clinging to? It's the matchstick. And the matchstick is what defines the nature of the fire.

Upādāna is a form of holding which defines the nature of the person. In other words, upādāna—let's say clinging—is not simple wanting. Upādāna is a form of wanting which is so strong that it actually defines who we are.

Now, wanting always contains its shadow, which is not wanting. So if there's something that I want, there's something that I don't want. If I want the sunny side of the street, I don't want the shady side. If I want the shady side, I don't want the sunny side. So desire and aversion—each is the shadow of the other, and upādāna, clinging, includes both.

But the thing about it is, it's a form of holding on or repelling away from which is bound up with my sense of who I am, my sense of identity. Who I am, who you are, what this world is. It's not simple wanting. It's a relationship to something which is necessary for our sense of who we are. If I don't have this, I die. Not necessarily physically, but I die in the sense of I don't know who I am anymore.

If you're caught up in some kind of addiction, one of the characteristics of it is that the person caught in it genuinely cannot imagine what it would be like to live without whatever it is. Because it's just so intrinsic to the identity that it's actually inconceivable what it would be like to not have it. It would be a different person.

We can see it on a broad scale. I think it's part of the problem behind the whole business about why we cannot, as a culture, as a society, adapt to climate change.

Someone is faced with certain scientific evidence that says disaster is coming. We've got to do something about it. And so the first response is, "Oh, okay, we'll do something about it. What should we do about it?" And then we get the list. And we look at the list and we realize what you're saying is we cannot live the way we've always lived—that business as usual is no longer an option.

Wait a minute. Who would we be? Who would I be? What would this society be like? I can't conceive it. Certainly I would not be here because surely I am the way that I live. My identity is caught up in all of this stuff. Take all of this stuff away—who am I? Who are we? It's just inconceivable. It's impossible to even imagine, and it's certainly horrific to even go in that direction. So let's just not go there and pretend something else is happening.

And the argument might come back: "But if we don't do this, we or our children or our grandchildren are going to die." And the problem is that if we do do this, I'm certainly going to die, because I cannot be the person I am. I have to be someone else, and I don't know who that is. So no, sorry, I can't do that. There's a pulling back.

And we can see it much more intimately in our relationship to our thinking. Why can't I drop this story about myself? Because if I did, I would drop myself. I would cease to exist.

I remember one time when I was practicing in Burma and I was having a horrific time wrestling with out-of-control thinking. Basically I would attack it with a sledgehammer—beat it, bash it with heroic effort and relentless noting until the thinking mind was reeling in dizziness and semi-consciousness. I would beat it down to the point where it got really quiet and looked as if it might possibly disappear. And as soon as the mind registered that it might possibly stop, there was a moment of panic and it was back again.

I was just astonished at my own perversity. But looking back I realized I was faced with the threat of death, because I was so caught up in my thinking that if it stopped, what would happen to me? Well, I'd be dead—because it was the thinking that was creating me.

So that relationship to thinking is upadana. It's feeding me. If I take this away, I'm taking away me. And that's horrifying.

Does any of this make sense? So this is the fire. This whole process is the fire. Nibbāna is the going out of the fire. This whole process just fades away.

We could say it's the extinguishing of the fire, but if we say "to extinguish a fire," it can convey something much too forceful. It's like the house is on fire. How do I extinguish it? Call the fire department. They have these massive hoses and they blast it with water and the fire's out. If we've got a kind of macho approach to the practice, then we can be having that approach—and this is certainly what I did when I was a foolish young man. Now that I'm old and wise, I don't bother. I just warm my hands by the glow of the fire.

But the image is the natural going out of the fire. If there's a fire burning, and as the Buddha points out, it all depends on its upadana, its fuel. So I'm faced with a fire, and if I look at what I'm doing—which we do in this meditation practice—I recognize that what I'm doing is hurling log after log after log after log onto this fire.

After a time I think, "I'm holding this log and I'm thinking, what should I do? What if I just drop it and don't throw this particular log on the fire?" That seems a good idea. Now the fire is still burning, but if I stop throwing logs on it, it starts to go out. And it's just a natural process. I don't need any divine intervention. It just naturally happens.

So the secret is: stop throwing logs on the fire. That's all. It's really quite simple. Very difficult, but fundamentally very simple. If we do that, the fire will go out in its own way, in its own time. But it's just a natural process.

Now there's a direct relationship between this going out of the fire and the practice of satipaṭṭhāna.

And basically it's all about our relationship to experience, how we relate to experience. When we start to practice, the way that we relate to experience becomes evident to us. One way of looking at it is that we discover that our normal relationship to experience is infected by a sense of something to gain or something to lose from the particular event.

So, right now, there is something I can gain or something that I can lose from this now. I'm sitting up here on the throne, giving a Dharma talk. I have something to gain. If I give a good talk, they'll think I'm a good teacher. They'll give me lots of dana. That'll be really great. And I have something to lose. If I give a poor talk, my reputation is dented. People will get fed up with it. They'll notice that I keep repeating the same talks all the time anyway, and they won't bother to come to retreats. I won't get any dana, and I'll be in trouble at home because our expenses are going up. So right now, in this situation, I have something to gain and therefore I have something to lose. My whole relationship to this is affected, infected by this relationship.

You have something to gain or something to lose. Why do people like Dharma talks in meditation retreats? Now I find this a totally perverse form of enjoyment. I really don't like attending Dharma talks in meditation retreats. I find them usually quite tedious. But I notice that a lot of people actually enjoy them. It seems to be the substitute for TV.

So you come in here, and what is it you want when you come in here? Do you want a nice, entertaining, interesting and stimulating Dharma talk? Is that what you want? Do you have something to gain? Do you have something to lose? "Oh my God, this is tedious." And if there's something to gain or something to lose, isn't it true that you're constantly judging the experience? "Can I give this one the thumbs up, or do I have to cross it out?"

And of course, when we're practicing, I'm following my meditation object. The same infection. I've got something to gain or something to lose from this meditation period. Am I getting my nice concentration? Or not? And it comes down—let's assume we're using breathing as meditation object, and I'm just using breathing as the example of the generic meditation object—this in-breath, is it fulfilling what I want it to fulfill? Is it doing what I want it to do? Is it behaving the way I want it to behave? Or not? This outbreath. What's that doing? I have something to gain or something to lose.

And this thought, this feeling, this movement, this desire, this aversion—the more I look at my relationship to experience, the more I see how this relationship is infected by this sense of gain and loss. In other words, grasping and rejection, clinging at a deep level. Upadana. Because all at the bottom of all this is who I think I am and who I want to be in the future. I don't want to be in the future who I am now. I mean it's okay now, but I really want to be someone better. I want an improvement.

So as we do the practice, we can see how deep this relationship goes. And if we look at our relationship to distraction, what is it that distracts me? Or rather, what's fueling the distraction? What's underneath it? It's this fuel. It's the upadana. It's the clinging. And it's there all the time.

So what we're doing in this practice is coming face to face with the experience. We're tracking the experience over time—we'll talk more about this tomorrow night. And in each moment, what we're doing is trying to be as clear as possible: this is the experience. And that includes this is my relationship to it.

Remember we talked about the basic dyad. There's the process of awareing and there's the object of awareness. There's always that dyad—there's the knowing and that which is known. So my relationship to this which I know, this which I'm aware of, is dominated by this clinging. But I can even see it in the process of awareing: the very way in which I know this experience is infected.

So I get interested in the whole process, and what I'm trying to do is simply be as clear and as intimate as possible with this whole process. The experience is just the experience. The awareing of it is just the awareing of it. That's all. Not adding anything extra.

So every time I note a meditation object, what I'm doing is creating a clean, clear relationship as much as possible to this experience right now. When the practice develops to some degree, we get a sense of what this means.

Sometimes people will report that after a few days of a meditation retreat, they go outside and suddenly realize, "Wow, the trees are green and the birds are doing what they're doing, and the bees are buzzing and the breeze is cool." Sometimes people will just stop and just look at nature or just listen to what's going on, and everything seems completely fresh, new. Have you ever had that kind of experience?

This indicates that mindfulness is getting stronger. That's one of the tell-tale signs. But notice that if you look at the nature of that experience, the nature of that relationship, it's much more clean than normal.

The classic one is: I've heard that the sunset is very beautiful from this particular view. So I go there to watch the sunset. And all the time, the mind's buzzing: "Oh, this is nice. This is quite nice. This isn't as nice as people say it is. It's not quite as nice as people say it is, but it's rather nice. And I must tell somebody about it." Or the 20th and 21st century equivalent: "How can I get a good photograph of it?"

That versus just, "Oh, that's what it is."

That second one has an intimacy to it. There's a directness and an intimacy and a dropping of the agenda, the habitual agendas.

When that starts to happen—well, first of all, the training is from the very beginning to cultivate that kind of relationship. So this is what it means to note something: "Okay, it's just this. That's all it is. It's just this."

And when this gets momentum, we get a sense of what it actually means when we have these kinds of experiences where things are much more simple, clean, clear. That gives us a sense of what the Buddha is talking about when he's talking about nibbāna. It's like the fire is going down a bit, and we get a hint of what it will be like when the fire drops away completely and that becomes the new normal.

So what we're doing is moving towards that. This is the one-way street. We're heading in that direction all the time. And it's all about our relationship to experience. What is this now?

So you can see there's a radical simplicity to it. This practice is radically simple. It can appear complicated—lots of different instructions about different aspects of the practice—but what it boils down to is a radical simplicity.

Mahāsī Sayādaw wrote these little books about how to do this practice. He's got primary objects and secondary objects and this kind of object and that other kind of object and this kind of meditation exercise and that kind of meditation exercise. But when he actually describes what is satipaṭṭhāna meditation, he says it's the practice of noting whatever arises in any of the six sense doors as it arises.

The doubt I had went away."

"Oh, good."

"You see, if we completely stopped thinking and knowing who we are, it's not so much that we'd be dead, but having had a father with dementia, I would hate not to know who I am and not to think."

"Did I say we completely stopped thinking? No. Let me answer my own question. No, it was more that nibbana would be like this."

"No, nibbana is where we do not believe our thinking. We do not take our thinking about what's happening to be what's happening. That's a big difference.

The example I like to give is that the Buddha has this concept of nimitta, which literally means, or one translation is, sign. And nimitta is something which indicates something else, something which points to something else.

So outside this center there's a sign that says Blue Mountains Insight Meditation Center. Now let's say you're coming to the Blue Mountains Insight Meditation Center and you see the sign and you stand there. And you wait. And you look around and you

think, where is everyone? What's wrong with these people? I'm supposed to be meditating at the Blue Mountains Insight Meditation Center and it says Blue Mountains Insight Meditation Center and there's no one here.

And if someone explained to you, 'Look, it's a sign. Right? It's not the center. The center's just over here.'

But we are like the people who stand underneath the sign wondering where everybody is. That's taking the thought about X to be X. But it isn't. The one thing that the sign is not is what it points to. Because otherwise it couldn't point to it. It couldn't do its job of indicating where it is.

So there's a gap between the concept and the actuality. And the thing about that gap is you cannot fill it in with a concept. And that's what we want to do, especially when we're academically trained. But we don't actually need to fill in that gap. It's a very comfortable place to live.

And it's not that we don't think, and it's not that things don't have meaning. It's just that we know that fundamentally the meaning is false."

And that gives us a great deal of freedom.

"Is that like the difference between the menu and the meal?"

Yes, very much so. I don't really need to know the menu if I'm hungry enough right now. But if I know the menu and I think I know what the meal ought to be, and I'm served something else, maybe I'll be unhappy about it. Well, the menu has served its purpose once you're chopping away, but it was useful because it helped you choose. So it's not that concepts are not useful—of course they're useful, they're necessary—but they're not what they are about.

What we tend to do is we stop at the concept. And when we do that, we miss what they are about.

"Don't you sometimes go along and you may let go of one concept but then put another one there?"

Yes, that's what we do. So the concepts arise, but it's the relationship to the concept which is crucial. You're more flexible. For example, with thinking—I could try to stop thinking. Let's say I'm meditating and my thinking is really bugging me, so I try to suppress thought. Some people can actually do it, that's one thing, but at best it's a temporary solution.

The other solution is I could allow the mind to think, but when a thought arises, I just recognize it as: this is just a thought. That's all it is. And when that happens, the mind naturally calms down. I don't have to do anything. It just calms down. I find that I think less, but the thoughts that I do think are much better quality, and I have a whole different relationship to my thoughts. I'm not so eager to believe them.

So let's say I'm anticipating something in the future, and I think I know what it's going to be, and therefore I've decided how I'm going to respond. But then when I get there, I discover it's actually not what I thought it would be. In my case, it's never what I thought it would be. But I can find myself reacting according to the script that I've already written for myself because I'm so locked into my concepts.

But what if even when I had the concept of what it's going to be, I didn't actually believe it? I knew: no, this is just a concept arising now. It's got nothing to do with what will happen later on. Then that concept would not have any power over me. It would be just the mind playing, doing what it does. And I wouldn't take it seriously. And I'd have a whole different relationship to it.

Thank you very much for listening.

CHAPTER 4

Tracking Elements

Patrick Kearney · 56 min

> *In this dharma talk from a month-long retreat, Patrick Kearney examines the practice of tracking the four mahādhātu (great elements) - earth, air, fire, and water - as part of kāyānupassanā (mindfulness of body). Drawing from the Satipaṭṭhāna Sutta (MN 10), he distinguishes between body in the broad sense (all five physical senses) and narrow sense (touch sensitivity), focusing on the latter through elemental awareness.*
>
> *Kearney addresses how modern culture's obsession with body image creates barriers to authentic body awareness, contrasting our concept-driven approach with the Buddha's emphasis on direct sensational experience. He guides practitioners to work from the inside out rather than conforming to external mental images, whether in posture, walking meditation, or general body awareness.*
>
> *The talk includes a detailed guided meditation exploring each element: earth (resistance from soft to hard), air (movement, pressure, vibration), fire (temperature), and water (liquidity and cohesion). Kearney emphasizes precision in awareness as crucial for developing insight, noting how the four elements always appear together though one may predominate at any moment. This foundational practice prepares practitioners for deeper investigation of experience beneath conceptual frameworks.*

This morning we're going to look at tracking elements as part of mindfulness of body.

When the Buddha talks about body, he includes two meanings or two aspects. In a broad sense, body refers to all the five physical senses: seeing, hearing, smelling, tasting, and touching. Anything that comes via the physical senses is body, in a broad sense. The first satipaṭṭhāna is tracking the body, and this includes all physical experience.

Then you get body in the narrow sense, which is the fifth of the five senses—essentially sensitivity to touch, which can be either internal or external. External touch would be things like the contact of the body against the chair, the cushion, the bench, and so on. Internal touch would be any sensation within the body that you might feel—for example, the movements of the breathing or physical pain. These are obvious ones.

Today we're going to focus on body in this narrow sense of sensitivity to touch, and we're going to look at it in terms of the four mahabhuta, the four great elements.

Before we get into this, at a more general level, the relationship to body is extremely important in meditation practice, particularly the way the Buddha talks about it. We tend to think of meditation as a spiritual activity. People in Western Buddhism sometimes talk about their spiritual practice, and this is a concept which I think the Buddha himself would not recognize because he has no concept of the spiritual. There's body and there's mind, and there's what completely transcends body and mind, which is the unconditioned, which is nibbana or liberation. But the realm of the practice is the realm of the body-mind. In other words, it's physical. Meditation practice is a physical activity.

Anyone whose body hurts when they meditate knows this. But we tend to bury this. We tend to push this aside. We tend to imagine that the body hurting is somehow extraneous—some accidental intrusion in our spiritual activities. But it's not. It's actually central. It's fundamental to it. So the relationship of body to the practice is absolutely central.

Where does the practice take place? It happens here. And body—one of the things that characterizes body is location. The body is here. The here-ness of experience is inherent with its physicality.

Think about being distracted by thinking in a state of total distraction. Have you ever had the experience of being in a meditation hall in a rather unpleasant situation where you're stuck in this hall and it hurts and it's getting pretty tedious by this stage and you really want to be anywhere but here, and then ten minutes later you wake up out of a fantasy in which you were, in fact, a long way away?

The mind has this capacity to be not here. In fact, it would be anywhere but here. We discover this as children and we've been using it ever since.

The body is relentlessly here. Has anybody ever had a physical experience which has not been here? I can be far, far away in my mind, but then I trip over, for example, and as soon as the awareness comes back to body, it's here. And it's now. It's not past, it's not future, it's not somewhere else.

When we talk about this as a physical practice, it's obvious, but it's more than obvious. The here-ness and the now-ness that the body provides is absolutely central to our whole relationship to this practice. So the relationship to body is absolutely central.

Now this relationship tends to be sabotaged by the mind, particularly in this culture, much more so than in the Buddha's time. When we're practicing according to the Buddha's instructions, one of the problems that we have is cultural translation. We live in a completely different culture, in completely different circumstances. We live in cir-

cumstances that the Buddha himself would never have even imagined. And we have difficulties grappling with this practice that I think people in the time of the Buddha did not have. One of the crucial ones is this whole relationship to body.

Our culture is utterly obsessed by body image. And it comes out in ways like various disorders.

our obsession with supermodels and the particularly strange body type required to be a supermodel. It emerges in our obsession with mirrors. How many of us would go twenty-four hours without looking into a mirror? One? Two? You're part of a cultural minority. Most of us look into a mirror practically every day.

In the Buddha's time, mirrors were very rare, very expensive, and by our standards, quite poor quality. Most people's sense of their appearance would come from occasionally seeing their reflection in water. That would probably be it. What would it be like to go through life without a completely ingrained sense of what we look like?

How many people have seen photographs of themselves? We have a really clear sense of what we look like, and through the advertising industry, what we're supposed to look like. We're constantly measuring the difference. Sometimes when I'm in a doctor's waiting room, I pick up a magazine—I don't know if the title is ironic or not—called *Men's Health*. It's all about what you're supposed to look like if you're a man.

What you're supposed to look like falls into a very narrow category. For a start, you're supposed to be young—you're really not supposed to be old. You're supposed to have no excess fat whatsoever, which I imagine would make you particularly cold in winter. Certain muscle groups that are especially visible are supposed to be highly developed, particularly in the chest and shoulder area where you're supposed to be enormous.

According to these images, if you don't look like this, you're apparently not really healthy. You start to get worried. I feel reasonably healthy—I only go to the doctor once a year for a checkup—but obviously I'm not, because I don't look anything like this.

All of this obsession is very much part of our culture, which was missing in the Buddha's time. The result is we have a mind that can create a world which is not here, which is not now. And then we view the body through this mind. Most of the time we do not have a direct relationship to the body. What we relate to is our concept of the body—what we think the body is or should be. We approach the body from outside the body, and we do this habitually.

When we're doing the stretches in the morning, I keep saying: don't push too far, don't try to reproduce what you think the posture is supposed to look like. You know how you look at yoga books and see some model demonstrating the perfect asana? The message you're receiving is that you're supposed to look like that.

I came across this in my early meditation years when I got into Zen. I was preoccupied—because I had so much pain when I sat—with developing good posture. I saw photographs of Zen monks in perfect postures, and they looked really good: always young men, nicely shaped, beautiful uniforms, sitting perfectly. This was presented as correct meditation posture. So naturally I thought I was supposed to look like that.

I struggled to get my body into that shape so it would look like that. I struggled for years. Of course, this is going about it completely the wrong way, because it's working from the outside to the inside—starting with a mental image, then wrestling with the body to make it conform to the image. This is completely opposite to the right approach.

The way to work with the body is to start from the inside and move out. If the awareness of sensation is right, the body will arrange itself the way it's supposed to arrange itself. The image is entirely up here—it has nothing to do with the body. The body knows what to do. Its understanding is being buried by our conceptualization, but it knows what to do.

To get there, we start from the inside. What does it feel like? What is the sensation? At what point is the body showing signs of distress? When does it panic?

And we can see the distress particularly in the breathing and any sense of panic or disturbance in the mind. We can also see the limits when we reach a point where we cannot move any further. I can move this limb this far, but then there's a wall and I can't move it any further.

But these are signals that come from inside. They don't come from out here. They don't come from mental image. They come from inside, and in order to read them I have to be inside. If I'm doing something as basic as a stretch, and I'm coming at it from the outside—this is what it's supposed to look like—that's when I will injure myself. But if I drop that, and I'm simply with it from the inside—this is what it feels like now—I will not injure myself. It just won't happen.

When we work with posture in the meditation practice, we have to learn to come to it from the inside. In other words, we need to learn to relate to the body through sensation and awareness rather than concept. When the Buddha talks about this, he talks about it in terms of the elements, the elemental qualities of physical experience. This is what we're interested in—not what we think the body is.

Any of this making sense?

So we're re-educating our whole relationship to the body where we are not concerned with what it looks like or what we think it looks like or what we think it should look like, but we are concerned only with what it feels like.

This social aspect, the social image of the body, comes up in retreats as well. You think it wouldn't, but it does, particularly when people do walking meditation. If you go to a place where you have people who are very experienced with walking meditation and you see them doing it, it's like they're creeping along really, really slowly.

One of my friends and teachers, John Hale, who some of you knew—when I first saw him do walking meditation in Burma, I had to stand and look at him for a while to figure out if he was in fact moving. He was so slow.

But we think, how do I do walking meditation? Ah, we look at someone who is doing walking meditation. I'm supposed to do it like that. What is this person doing? They're creeping along at zero kilometers per hour. Therefore, my job is to creep along at zero kilometers per hour. So I start to do it, and it feels terrible. The conclusion—the completely distorted conclusion that I draw from this—is, I don't like walking meditation. I think I'll just forget about it and focus on the sitting, rather than concluding, maybe I'm doing it wrong.

It's about what it feels like. What does it feel like to move? Does the body and the mind feel at ease? Can I get—am I feeling maximum sensation as I move? Am I getting the sensation that normally I miss because I'm so busy trying to get somewhere? And you notice that when I'm trying to get somewhere, what's that somewhere? It's an image in the mind. It's got nothing to do with the body as it moves.

Is it possible to move from one end of that veranda to the other end with absolutely no understanding that I'm moving from one end of the veranda to the other end? I'm simply moving. That's all. What does it feel like to simply move? Actually, it feels magical when you do it. It's just magic.

So forget about what it looks like and focus only on what it feels like. That's the essence of it.

Now when the Buddha conceptualizes this—and of course in order to speak about it we have to conceptualize, so we have to have some kind of language, we have to have some kind of framework—the framework that the Buddha uses when he's talking about

the experience of body in this narrow sense, which is sensitivity to touch, he conceptualizes in terms of the four mahādhātu, the four great appearances, as the four elements, the dhātu of earth, air, fire and water.

This is what we're going to play around with today. These are elemental qualities of experience.

Earth element is the experience of resistance from soft to hard. For example, if I move my hand down, I have the experience of movement as the hand keeps coming down until it reaches a point that I would normally conceptualize as "my hand just hit my leg," where there's a sense of resistance. At first this is soft, but if I keep trying to move, it gets harder and harder until the resistance becomes absolute—it can't go any further. This quality of resistance is earth element, and it ranges from soft to hard.

Air element is movement—the experience of movement in all of its forms: pressure, vibration, expansion, contraction, and so forth.

Fire element is the experience of temperature from cold to hot. One thing about this retreat so far is that fire element has been pretty strong. When you step into a heated room or step outside, fire element seems to be particularly obvious here.

Finally, water element is the experience of liquidity and cohesion. Liquidity is wetness and dryness, and cohesion is stickiness and slipperiness.

So what we're going to do is take a brief tour of these elements. Again, it's very artificial because we're using concepts, but we're using a conceptual framework that hopefully, if it works—if it does what it's designed to do—will point us toward aspects of our experience that are beneath our normal conceptual framework.

When we do this practice, we are always interested in the elemental quality of the experience—that which is beneath the concept. The concepts keep floating along at the top, but we're always interested in what's underneath the concept, even when we work with thinking itself as a meditation object, which we'll be doing later on in the retreat.

Now when we do these little meditation exercises and experiments, as we did last night, rule number one: do not take them seriously. They are games. Be playful with them. Don't ever take them seriously. The more playful we are, the more we can learn from the experience.

As a more general rule, never take the Dharma seriously. The Dharma is far too important to be taken seriously. The sense of play and experimentation is really important.

Whatever happens when you do these exercises is exactly what is supposed to happen. That also is a very important principle. There is no such thing as a wrong result. What there is, is what happens. And what we're interested in in this practice is what happens.

Remember we talked about the basic principle: settle awareness in the body and then see what happens. Whatever happens is what's supposed to happen.

Any questions or comments before we get started?

"Patrick, one question. You said water was wet and dry and cohesion."

"That's the cohesion—stickiness and slipperiness. Wetness and dryness is liquidity. It's the most difficult to directly sense. Apparently the first three are more obvious, according to the books, although you get different responses when people actually do it. So rather than me trying to lay down whether it is or isn't, let's find out when we do the experiment."

So settle into your meditation posture. Establish the posture and begin by opening your awareness up to the whole body, experiencing the whole body.

Now turn your attention to those parts of the body where you feel hardness. Where can you find hardness? Look for it. And if you can find it, focus on it and name it: "Hard. Hard."

Now focus on those parts of the body where you feel softness. Where can you find softness? Look for it. And if you can find it, focus on it and name it: "Soft. Soft."

Now open your awareness up again to the whole body, experiencing the whole body. From there, turn your attention to those parts of the body where you feel heat or warmth. Where can you find heat or warmth?

Look for it and when you find it, focus on it and name it.

Hot.

Warm.

Now focus on those parts of the body where you find cold or coolness. Where can you find cold? Coolness. Look for it and when you find it, focus on it and name it.

Cold.

Cool.

Thank you.

Now open your awareness again to the whole body experiencing the whole body. And from there turn your attention to those parts of the body where you feel wetness. Where can you find wetness? Look for it, and if you can find it, focus on it and name it.

Wet.

Wet.

And now focus on those parts of the body where you feel dryness. Where can you find dryness? Look for it. And if you can find it, focus on it and name it.

Dry.

Dry.

Thank you.

Now open your awareness again to the whole body experiencing the whole body. And from there turn your attention to those parts of the body where you feel movement. Where can you find movement? Look for it. And if you can find it, focus on it and name it.

Movement.

Now open your awareness again to the whole body experiencing the whole body and from there open up to all the elements. Be aware of the whole field of the body and accept the full flow of all the elements as they move through.

Don't try to hold onto any one particular sensation. Just allow whatever is happening to happen. Let everything flow throughout the whole body.

Okay.

With the four elements, which one did you find easiest to find, and then having found it, easiest to stay with?

Movement.

Movement. Where did you find it?

In the lungs, and the heart, and some in the gut.

Mm-hmm. Anyone else? What was...

Earth.

Earth. Hardness or softness?

Hardness.

Hardness. What about... Did you find softness?

Not as much.

So hardness is more obvious. Where did you find it?

In my base.

Sitting on it. So the foundation of the body.

Foundation. Yeah.

Yeah. Everywhere.

Everywhere. Whole body?

Yeah.

Beyond the body?

Yes.

The tradition points out that these four Mahābhūta always appear together. If you have one, you have all four. But at any given moment, one of them may be predominant—one of them stands out from the crowd. But if there's one there, they're all there. They always come as a package. Sometimes that could be quite clear in terms of the experience, and sometimes it's not clear.

One student wondered about the role of suggestion: "Whilst I was concentrating on all of that, I was wondering if some of the aspects were there because I knew it was there. Like, for example, I know my eyes are wet, so it was easy for me to feel the wetness. So there's some element of suggestion."

There's always an element of suggestion—always. That's always part of the package, I think. But for our purposes, it doesn't matter. You might wonder whether it counts because there's some element of suggestion, as if you're saying there's a valid experience of wetness and an invalid experience of wetness. But actually there's just the experience of wetness. The "valid" and "invalid" is just the mind conceptualizing about it. So don't worry about it.

This is an interesting exercise, especially when you have localized sensations. If you're interested, let's say you've got an itch. We tend to take something like an itch for granted. If you went up to someone on the street and said, "Do you know what an itch is?" they'd probably look at you very strangely and say, "Of course I know what an itch is."

But then when you look at something that you think you know, you realize, actually, I don't know. When I start to examine it, I actually don't know. And that curiosity powers the meditation. So it would be a very interesting project to try to pin it down. The closer you get to it, the more you can't find it. If you really drop beneath the conceptual level, can the itch survive?

Well, sensations rise and they fade. But what is it that's arising and fading? I just recommend we keep investigating. It can be quite interesting.

A student asked whether all experiences could be categorized in terms of the four elements. It is just a conceptual framework—it's not the actual experience. But yes, the Buddha would say that anything in the realm of touch can be mapped in terms of the four Mahābhūta.

That's the same with respect to pain. You could spend days, weeks, months looking at pain. When you can break it up into its elemental qualities, one might ask: where's the pain? What happened? It was a concept.

This is an exercise in precision—aiming directly at what's actually there.

Precision in awareness is very important if you are practicing for the purpose of insight. As the retreat goes on, the more precise you can become with your awareness, the better.

Now, precision also requires a fair amount of energy. This is a high energy practice, exercise. I notice some people nodding off. Still early days in the retreat, but sometimes you go through periods of time, and sometimes it's a question of biorhythm.

For me, I wake up really slowly. When I'm doing a retreat, generally my best meditation time is about mid-afternoon through to early to mid-evening. That's when I'm at my most awake. So if I'm going to do really precise work, that's when I'm most likely to do it. Often the first sitting of the day, my meditation practice is to stay more or less conscious, more or less upright. That's my meditation practice. It's the best I can manage most of the time.

So depending on levels of energy, the nature of the practice changes. But where you can be precise, be precise. That precision stimulates mindfulness, concentration, energy, and it also stimulates the perception of impermanence. And the perception of impermanence is the gateway through which insight comes. So precision is very useful.

You notice how we're using the naming with this exercise? And it fits quite neatly. When you're being precise, it helps to name, to specify exactly what it is. So with Katie's example, oh there's an itch. So what is that? Here, using the elements. So which elements? So you're dropping the general concept, itch, and you're using a more precise concept—movement, hardness, whatever—to try to pinpoint, well what exactly is it? So you've got a higher degree of aim and accuracy allied with the name.

So the naming can be very useful for cultivating aim. That's essentially what it's for. And what name you use influences where you're sending the awareness. So be creative with the names. Name it as you feel it. And sometimes the name can be a question. Like, what is it? That also directs awareness to where you want to go. So the naming can be useful.

You notice that some things are obvious and some things are not obvious. As a general rule, you stick to the obvious. So if some aspect of experience is more clear to you than other aspects and you can hold it more readily in your awareness, that's what you work on. Because that helps stimulate the mindfulness and it gives you a sense of momentum.

So if there's some aspect of experience that you're simply not connecting with, forget it. Even if it's a hallowed, canonized and sanctified aspect of experience, like for example, breathing. If you can't find it or if it's difficult to hold on to, just drop it. And go to something obvious like the hardness of the base of the body, for example.

So you look for what's obvious, what's clear, what you can find and hold easily, and you work on that, and then the mind will get stronger, calmer, clearer, and things will start to develop from there. So don't go after something more difficult.

And again and again, dropping beneath the concept to what is it actually. In other words, becoming more and more intimate with the experience. And this is really crucial. The further we go in this retreat, the more intimate we become with the experience. And that's always underneath our thoughts about it, our concepts of it, what's happening underneath there.

Finally, one last thing. Those of you who found movement clear... Is there a difference between movement and breathing? Or are they the same?

Different.

I had a pulse in my finger that had nothing to do with breathing." "And you stayed with that pulse?" "No, it was there. It didn't run away."

"Anyone else?"

"Breathing is definitely part of my movement—part of the movement. I had different sorts of rhythms going on, so it was one kind of rhythm."

So movement is a broader category, and breathing is a more specialized aspect of it. There's also different movement within breathing. I'm sure no one's missed that I'm a bit chesty at the moment. So within the breath there was the movement of the bubbles in the lungs. They're caused by the breath, but they're not the same thing. So you've got movement as a broader category, and inside that the breathing, and then within the breathing there's also movement, which is not the breathing.

"I can just feel—I can hear my heart and my chest, I can feel my heart and my chest pulsing."

So you get a sense of pulsation as well.

Tomorrow we're going to be working on breathing as a meditation object. But I just want to draw your attention to the question: what is the difference between breathing and air element? We'll pick that one up tomorrow morning when we work on breathing.

You notice that the most common elements used in meditation practices usually are air element and earth element—in other words, movement and touch. Let's say you're doing walking meditation. What have you got? You've got movement and you've got contact on the ground. Movement, touch. Sitting meditation: movement, breathing, touch, contact with the ground, the feel of the body. These two elements are the basic standbys for meditators.

Get to know the elements. Get to know the elemental qualities of the experience.

Any questions or comments before we close? Thank you.

CHAPTER 5

Mindfulness of Breathing - Ānāpānasati

Patrick Kearney · 1h13

> *In this dharma talk from a month-long retreat, Patrick Kearney provides an in-depth exploration of the Buddha's classical instructions on ānāpānasati (mindfulness of breathing) as found in the Satipaṭṭhāna Sutta (MN 10). He examines the traditional pericope - the standardized passage on breathing meditation that appears throughout the early texts - offering his own interpretation while acknowledging orthodox Theravāda perspectives.*
>
> *Kearney emphasizes that mindfulness of breathing is fundamentally about the mindfulness, not the breathing itself. He guides listeners through the progressive stages: from simple mindful breathing, to understanding the breath's varying characteristics, to training with the whole body (sabba kāya), and finally to calming the bodily formations (kāyasaṅkhāra). Drawing on his understanding of Pali terminology and meditation experience, he explores how the practice deepens from cognitive awareness to intimate sensing (paṭisaṃvedeti), ultimately leading to the dissolution of subject-object duality.*
>
> *The talk addresses practical challenges Western practitioners face with posture and technique, while maintaining grounding in early Buddhist teachings. Kearney's approach demonstrates how ancient instructions can be interpreted through contemporary meditation experience, always with respect for traditional sources while acknowledging the need for skillful adaptation across cultures and centuries.*

Tonight we're going to look at mindfulness of breathing. This morning we were doing some exercises, experiments in using breathing as meditation object. And tonight we're going to have a look at a standard paragraph of the Buddha's instructions on breathing meditation. It appears in the Satipatthana Sutta but it appears in other discourses as well. So we're going to go through this and unpack it.

When you write it out as a paragraph, of course this was not written, it was chanted, but it's what's technically called a pericope. It's a kind of unit or a bundle of text that's memorized and then is put into different discourses where it's appropriate. So if you're an early Buddhist reciter and the topic of breathing meditation comes up, you can recite this bit. This is the standard bit on breathing meditation and then you've covered breathing meditation. So it's like a module that fits into different discourses depending on its purpose.

It's a Greek term, P-E-R-I-C-O-P-E. It's a term used by scholars of historical criticism when they're taking ancient texts apart. It was first used with the Bible, but the methods of reading that were developed for the Bible were then transferred to early Buddhist texts. And this is generally called historical criticism. So the terminology that people use when they study the Buddhist teaching is actually borrowed from biblical study. And the methods are borrowed as well, and a lot of the attitudes and assumptions are borrowed from biblical studies, including the idea that we have to get back to the original Buddha and the closer we get to the original Buddha the more authentic it is. This is borrowed straight out of New Testament studies - we've got to get back to the original Jesus and the closer we get to the original Jesus the more authentic it is. That's where the very idea came from. There's a lot of Christian assumptions underneath the way that we read these texts.

But anyway, the point is that this is a kind of standard way in which the early tradition talks about breathing meditation. When you write it out, it's only a paragraph. And we're going to go through the paragraph. And I'm going to give an interpretation of this. But I do emphasize this is my interpretation. So don't take it seriously. It's one way of reading this. And these - it's not gospel truth. No, it's not Buddha's truth. Definitely not gospel.

The text provides a kind of idealized template of how breathing meditation works. And I think the way these function, these templates, is that they're meant to be interpreted and to be played with. I think it's a mistake when reading the Buddha and he lays out all these little schemas, it's a mistake to take them too literally. They're structures which are literally memorized. And then once you've got them in your memory banks, you can play with them, you can riff, as it were. And this is the way an oral tradition works. You have a kind of memorized template, you know that, you've got a certain structure, and so long as you stay within that structure you can then play with it in different ways, and different groups and different individuals would play with it in different ways. But when they would recite, they do cite the same text, because all these different ways would fit into this one template. So this is my particular spin on it.

So, let's begin. The first sentence: "Here a practitioner goes into a forest or to the root of a tree or to an empty place, sits down, crosses her legs, straightens her back and establishes her mindfulness directly."

This is the beginning. Wherever you see this sentence, from this point on, the Buddha will start talking about a formal meditation practice. Now in this case he's going to talk about breathing meditation, but in other contexts he'll talk about another

form of meditation, but it's always this sentence that indicates the beginning. "Practitioner" of course is a translation of bhikkhu, because that's what, as we discussed last night, that's what bhikkhu in the sutta context means.

And you notice that the Buddha begins with location. Where should one do one's meditation? And I find it interesting that way back then this was an important issue. So you need the right place to do this. And of course today we find the same thing.

We need the right place to do this. Some places are better than others—some work well and some don't work so well.

For the Buddha, the first place he mentions is a forest. I find this interesting because he assumes if you're going to be doing any serious practice, you would naturally head there. Like, what are you doing here? There are trees out there—lots of trees down that direction. What are you doing here? It's an odd place to meditate. So presumably he would have just assumed everybody would be heading out to the bush, which is what they did in those days and what he himself did.

So there's a forest, or the root of a tree. Maybe there aren't too many trees around at this point, but still, it's underneath a tree. Trees are good for meditation. Or an empty place. According to the tradition, this would be the third option—an empty place. So a meditation center is an empty place. In other words, it's empty of usual, normal humdrum activity, and therefore available for meditation practice.

So the meditator sits down, crosses her legs, and straightens her back. This is all the advice the Buddha ever gives about posture. But you notice that he begins with posture. He doesn't leave it out. He doesn't say, "Okay, you're going to start meditation, so here's the first jhāna, the first absorption, and second, third, fourth." No, he says first find the right place, and then set yourself up with good posture. So posture is important.

Now he doesn't give much instruction about it, I think for two reasons. One is that, again, what's chanted and remembered is a kind of template, and it's necessarily dense and brief because this is being memorized. So there would have been a lot of understanding about posture—āsana—within the community. But they wouldn't have memorized that. That would be more commentary when you're unpacking this sentence. Okay, so how do I set up good posture? Well, this is how you do it. So this kind of practical, everyday practice information would not have been in the sutta, but it would be part of commentary once you start to expand the sutta.

And also, of course, in those days people would not have had much problem with posture. They were raised without furniture. Houses didn't have furniture. So people were raised sitting on the floor. The necessity to give detailed instruction on how to sit

would have been roughly equivalent to, in our culture, having to write down and transmit detailed instructions on how to sit in an armchair. If you buy an armchair, do you get detailed written instructions on how to use it? No. Why? Because it's bleeding obvious. Everybody knows how to use it because we've been using them all our lives.

I think it's the same here. There's not much said about posture—about setting up a posture—not because it's not important, but because for them it was so much easier than for us. So we have to struggle to get a posture. We have to go to yoga classes and do stretches and so on and so forth. And we have to do it because otherwise we're fighting the body.

A lot of meditators do fight their bodies, especially when—I mean, my generation, when we started, we had absolutely not the foggiest idea of what we were doing. And then we trot off to Asia, and of course the teachers have absolutely not the foggiest idea of who these weird people are, and no comprehension of where they're coming from—geographically, culturally, psychologically. They're in a society in which people just routinely sit on the floor, so they just say, "Well, sit there and meditate. And then, please report your experience."

"Well, it was incredibly painful."

"What's the matter with you? You only sat there for fifteen minutes."

So what is being established? This firmness, this groundedness of awareness is being established "directly" - and this is another word that conveys this quality of firmness and directness. The term is *parimukham*. Usually it's translated as "in front" - are you familiar with that? "Establishing mindfulness in front of you?" The Pali is *parimukha*. *Mukha* - who knows what *mukha* means? Yes, mouth. And sometimes it can be face, or opening, entrance. And *pari* means "around" or "all around."

Now, this bit is really 100% me. All the authorities disagree with me. I'm warning you.

So the usual interpretation is that you establish mindfulness in front of you, which gives you this sense of mindfulness being somewhere out there in front of your face. But to me, that doesn't make sense at all. If *mukha* is mouth, and *pari* is all around, then *parimukham* means all around the mouth. And if you think about it, when you're really present, when you're really here, where is your awareness? It's right here, right around the mouth area, around the face. It's intimate, it's close, it's direct.

This isn't some abstract positioning of mindfulness somewhere out there. It's immediate. It's *right here*. When you're fully present, the awareness is gathered right here, intimately connected with the breath, which comes in and out through the nose and mouth. There's nothing theoretical about it.

So the practitioner establishes this mindfulness *parimukham* - directly, intimately, right here around the face, around the breathing. Not projected out somewhere, but gathered, concentrated, immediate. This is what I think the text is pointing to - this quality of intimate, direct presence that's grounded right here in the body, right here with the breath.

Of course, you can take it or leave it. All the commentaries will tell you something different. But to me, this interpretation makes much more sense of what we're actually trying to do in practice. We're not trying to put our mindfulness somewhere out there in front of us. We're trying to gather it right here, intimately, directly, where we actually are.

means around—it can mean around as in circling, or it can mean around as in complete. The prefixes have bundles of meanings.

So one of the interpretations that was picked up early in the Theravada orthodoxy was that mukha means opening, as in the opening at the face—the nostrils. Pari means around, so around the nostrils. So if you do breathing meditation, you follow the breathing here, at the nostrils.

This interpretation is first written down in the Patisambhidamagga, the Path of Discrimination, which is a Theravada text. It's not found in any other school. It's very early—so it's classified as Sutta, but it's an Abhidhamma text and it's in the Khuddaka Nikaya, the collection of miscellaneous discourses. So it's kind of an add-on towards the end. Modern scholars think it's definitely after the Buddha, but it's very early.

And this interpretation that you establish your mindfulness here is very, very early, but it's peculiar to the Theravada. It's just one interpretation of this. But that's why if you go to an orthodox Theravada teacher and you say, "I want to do anapanasati, mindfulness of in and out breathing," you'll be told, "Sit down and focus here, at the entrance. And this is parimukha, because Buddha says so. He says so right here."

I think here that parimukha, first of all, is an adverb, not a noun, and it's an idiom. And this is one of the problems with translation.

Imagine you are an archaeologist living 2,000 years in the future, and you're digging under the ground in this particular obscure part of the planet, where once upon a time there was a city called Sydney. And as you're digging up all these artifacts, you come across a fragment of text. And it's like, "Hallelujah, this is fantastic. We're getting an actual text from these people." And you're puzzling over it. It's very brief, and it's something about catching a cab.

And you realize that other people have discovered other documents, other fragmentary documents, which also refer to the catching of cabs or taxis. So you get together—what would all this be about? Well, you find these fragments, particularly in urban areas. So the taxi or the cab must have been some kind of creature which was found, especially in urban areas, and which was a problem because they had to be caught. So there was probably organized hunts that people had. And so you could write learned articles and publish them in archaeological journals.

And of course, they've missed the point because catching a cab is an idiom. It's not meant to be taken literally.

And I think this is an idiom. I think parimukha is rather like the English idiom if you say something is "in your face." Boom. Or "get out of my face." What are we conveying? We're conveying a directness and a closeness.

And I think this is what's being conveyed here. Establishing mindfulness, bang, like this, in your face. You know when you do intensive meditation practice, the experience can be like that. It's like, vroom. Sometimes you want to take a break because everything is too close. You just, "Okay, I've just got to get out of here. Give me some space, man," because meditation has that character, and I think this is what it refers to: to establish mindfulness bang, directly, face to face.

When we talk about noting, it's a face-to-face encounter with the experience. We talk about the secondary object—I am distracted. So often the relationship to the distraction would naturally be, "Oh, there's something buzzing around here and I'll just kind of vaguely swat it away while I'm struggling with my meditation object." But Mahasi Sayadaw says, "No, note the secondary object." In other words, turn to it, bang—a face-to-face encounter with it, a direct encounter.

So I think this is actually what the Buddha is talking about: to establish mindfulness directly. And again it conveys this direct, solid, grounded face-to-face encounter with the experience which is characteristic of mindfulness meditation.

Does that make sense? You're not going to burn me for heresy?

Anyway, that's my interpretation. So here you could sum it up: be firmly grounded and established in the physicality of the experience. You notice everything so far is physical.

Be grounded in the location, the place, the body that's there. Bang. Direct. And so far no mention of any specific meditation object. It's just the body so far.

Then the Buddha says, "mindfully she breathes in, mindfully she breathes out." And this is describing the practitioner. So, then, find the movements that indicate the breathing and breathe mindfully. That's it. Very simple. Just breathing as per normal, but doing it with mindfulness established directly. In other words, remembering the breathing.

Breathing in. Breathing out. Breathing in. What was that? Out. Breathing out. Breathing in. Breathing out. Now there was something I was supposed to remember. Breathing in. Got it. Then what comes after it? Breathing out. Breathing in. Breathing out. Keep remembering. This is mindfulness. Remembering the breathing.

We are already breathing, but do we know we are breathing? Are we aware of the breathing? Can we remember that we are breathing? And is there a continuity of that? Can we notice our tendency to forget our breathing? Because part of mindfulness is remembering, but of course part of remembering is noticing when we forget. Becoming aware of that.

You notice that the key here is mindfulness. "Mindfully she breathes in, mindfully she breathes out." It's not about breathing. It's about mindfulness. This is the crucial point here. It's not about the breathing. It's about our relationship to breathing.

For example, if I'm doing breathing meditation, sometimes I find that my awareness can be sucked into the breathing itself. And when this happens, the breathing becomes increasingly distorted. We were talking this morning about whether you find yourself interfering with the breath as you're tracking it, as you're being aware of it. If we forget the mindfulness and just obsess with the breathing, this is what can happen. The breathing becomes incredibly important. It's got to be just right. And we get tangled up in it. Often there's a sense of claustrophobia or tightness associated with this. But certainly a sense of strain and often a sense of an exaggerated breath in some form or another.

I find myself breathing deliberately, but the point is I don't have to breathe deliberately. What I have to do is attend deliberately. What's happened is I've forgotten, in terms of mindfulness of breathing, I've forgotten the mindfulness and I've got sucked into the breathing, into the physicality of it.

But mindfulness of breathing is fundamentally about the mindfulness, not the breathing. It's about the relationship to the breathing. And the relationship is one of remembering and becoming sensitive to the forgetting. All of this is what's going on in the mind, not in the breathing.

Similarly, with thinking, if we're practicing mindfulness of thinking—which we will be doing, playing with it in a couple of days—our tendency is to forget the mindfulness of and get sucked into the thinking. So we get caught up in the content of our thoughts. But mindfulness of thinking is about mindfulness. It's remembering the fact of thinking, the flow of it, the process of it.

We talked about how in meditation practice we're always dealing with a dyad of mind and its object. So we could call it awareness of X. We're always dealing with that, and it's got two parts. Awareness of X has two aspects. There's X, what we are aware of, and the awareness of. We're always working with that dyad.

Normally, my interest and my concern is with X. That's what's interesting. I see something—I'm interested in the something that I'm seeing. I think something—I'm interested in what I'm thinking about. I'm eating something—I'm interested in the food. I'm reading something—I'm interested in the book. It's obvious, isn't it? That's our normal relationship, our normal habitual relationship.

But when I am mindful of X, aware of X, I am keeping X in mind. And that means that my interest is not simply in X but in my continuing awareness of X. So there's a shift in the interest. It's not the object which is of prime concern. It's the awareness of the object. You see the difference? It's this subtle but important shift.

So it's not the breathing that's important. It's my awareness of the breathing. It's not the thinking that's important. It's my awareness of the thinking which is important. There's a turn in the point of interest and attention, which is not our habitual habit. It's not what we normally do. We're not used to this. And this is why it's so weird when we start to do it and why we have to keep pulling ourselves up. We keep getting lost in the object of awareness. And again and again we have to pull ourselves back. No, it's not that. It's the awareness of that that I'm interested in.

So it's the relationship to that we're interested in. What is that relationship? Let's say, when you're talking about breathing as a meditation object, what's my relationship to the breathing? Am I fighting the breathing, for example? Am I forcing the breathing? Do I like the breathing? Am I satisfied with the breathing? Do I dislike the breathing? Is it easy to find? Or is it hard to find? Is the mind that is aware of the breathing distracted?

Or is the mind that's aware of the breathing unified?

So these are the issues that are of interest. It's not the breathing itself. It's the relationship. Does that make sense?

Breathing in a long breath, she understands she's breathing in a long breath. Breathing out a long breath, she understands she's breathing out a long breath. Breathing in a short breath, she understands she's breathing in a short breath. Breathing out a short breath, she understands she's breathing out a short breath.

Now you notice that the project has changed. In the previous sentence, the verb was to breathe. She breathes in, she breathes out. Added to the breathing was the mindfulness. So you're breathing in and out, or you're already breathing in and out, but do it mindfully.

Here, it's not about the breathing—it's about understanding. And the verb here is pajanati, from which we get the noun panya, wisdom. So, understanding. And what's being understood are the varied characteristics of the breathing. Now here, in particular, is it long or is it short? Which is one of the exercises we did this morning, wasn't it? Which one is longest? Which one is shortest?

But again, this is a template. This is an idealized template. And I think this is shorthand for the kind of exercise that we were doing this morning. What are the different characteristics of the breathing? How does it appear? What are the different things that it does? What are its various characteristics over time? So we don't take breathing for granted, but we start to explore it, as we were doing this morning.

Now this implies anupasana. This is a term that we haven't talked about yet. We'll be talking about it more later on. But anupasana is the basic activity of satipatthana, of mindfulness meditation. And I translate it as tracking. It's basically following an experience over a period of time. This is about cultivating a continuity of awareness of the object, whatever it is—in this case breathing. So I'm studying it over a period of time.

And as I do that, I can see it's changing all the time. So I can get a sense of how it behaves over time. Sometimes it's like this, then it does that, then it does this other thing, and then it swings back and it's doing what it was doing before, and then it does something completely different. So it's changing all the time. And this sentence is all about understanding these changes as they take place over time. Understanding the varying characteristics, the behavior of the breathing over a period of time. Getting to know it.

And as we do that, understanding or wisdom develops. And it's basic ground level understanding. This is what the breath does under certain circumstances. And this is what it can do. If I do this, that happens. If I do that, this other thing happens. When I'm tired, it's like this. When I'm alert, it's like that. So we're studying something over a period of time and getting to know it, which means getting to know how it behaves.

Does that make sense? And this is the beginnings of wisdom.

The next sentence: "She trains herself to breathe in, sensing the whole body. She trains herself to breathe out, sensing the whole body."

So here it gets really complicated. We've got three activities: training, breathing, and sensing. There's a pattern emerging through these instructions—basically, an increasing sophistication and deliberation in the relationship to the meditation object. Again, it comes back again and again to the relationship to the experience. That's what we're working on, and this relationship is developing.

It starts with breathing, then breathing mindfully, then from breathing mindfully to understanding the breathing, and then from understanding breathing to training the breathing. The verb here is *sikati*, to train.

Now, the breathing itself is natural. It just happens by itself. It's just part of nature. But when we practice mindfulness of breathing, our relationship to the breathing becomes part of the picture. It's not just breathing anymore—my relationship to it is part of the picture.

Over time, an understanding develops—an understanding of the breathing and of the mind that's following the breathing. This relationship becomes more sophisticated. We start to see the patterns of breathing, the patterns of the body influenced by the breathing, the patterns of the mind as we breathe, the interrelationship between breathing, body and mind. All of this starts to become apparent.

And then from there we move on to training. This implies that our understanding becomes more deliberate. Training implies deliberation. I'm making decisions in maintaining this relationship of mindfulness. I'm doing something. I develop a strategy: How will I practice this? I'm making choices all the way, and I can see some choices work, some don't. I try this—no, it doesn't work. I try that—ah, this seems to work. I'll keep exploring this one. No, it's stopped working now; I've got to try something else. Ah, this seems to work.

And so we recognize what we are doing and we start to do it more deliberately. There's a sense of direction in what we're doing. There's a craft beginning to emerge. There's a skill that's beginning to develop. We're not simply aware of whatever is happening. We are deliberately taking the practice in a chosen direction.

For example, as we were exploring this morning, sometimes I will focus in on the precise detail of the breathing. Sometimes I'll step back and have the whole pattern revealed with no attempt at getting detail. That's one obvious fundamental choice that we make. We discover through understanding that sometimes it's best to focus in, sometimes it's best to pull out. We get to understand ourselves: I'm much more at ease when I focus in and I have something specific to hold on to. Then I can keep the mindfulness going, I can keep the mind clear, I can hold the meditation object over a period of time.

Or alternatively, I discover that when I do that, I just get really tight and tangled up. For me it's best to step back as much as possible, open up the field, and let the whole thing flow.

Or the same person might find that in the first few years of practice, focusing on detail was essential because they needed something to hold on to. So they would follow the breathing in the abdomen because they could find that, could hold on to it, or at the nose tip, or whatever. But later on they discover they actually don't need to stay in any one particular location. Wherever the breathing appears, they can just go there.

So you see these alternatives. I get to know the patterns of the breath. I get to know me, the way my mind works. And at some point, it's like I deliberately steer the ship in a certain direction. I'm going to go in this way with my meditation practice. And this is training—*sikkhā*. It implies a deliberation and a sophistication in the relationship to the breathing which wasn't there before, but now it's beginning to develop.

She trains herself to breathe in and breathe out, sensing the whole body.

Now this verb, "sensing," is *paṭisaṃvedayati*. In the P.T.S. dictionary, this means to sense, to experience, to feel. The root is *vid*, from which we get "verity," from which we get *vedanā*, feeling. So sometimes you see this translated as... what do you say? Does it feel? Sometimes translated as that. So *vedayati* can be translated as feeling. And then you get *paṭisaṃ*, which I think it's impossible to translate literally, but basically it adds an intensification to it.

What this verb suggests—when you see this verb appearing and look at the context—is a greater intimacy. It's like it's getting closer and closer and closer and closer. More intimate, less cognitive.

Let's say when I start meditation and I'm told what you must do is sit down and follow your breathing and then you get enlightened. It's pretty much what I was told. So, okay, breathing. Okay, this could be a bit delicate. I haven't done much of this before, but I'll try. So I set up the posture and I'm feeling very self-conscious. Now I feel like a meditator. I've got a good cushion. Now I've got to get a bit of breathing going. So, go for it. It's got to be clear. I've got to hang on to it. And it's all very cognitive.

I often realized at one point in my meditation career I was following the breathing—I did five years of Zen and they do the breathing down here—and I realized it was like I was aware of breathing down here from up here. Basically, I think I will follow the breathing, and this is the decision made up here. Where do I find it? I find it down there. So I'm up here and the breathing is down there.

Have you ever had that kind of experience? Is it just me?

But this *paṭisaṃvedayati* is suggesting, no, you're getting over that. The awareness is down here. The breathing is down here, and the awareness is down here. There's an intimacy in the mind, which we'll talk more about tomorrow.

So the relationship—again, it's the relationship to the breathing which the Buddha is talking about. And this relationship is changing. It's becoming closer, more intimate, less heady, less cognitive, more feeling-based.

And as he says: *She trains herself to breathe in, breathe out, sensing the whole body—sabbakāya.*

Now this is weird, because apparently the breathing just disappeared. I mean, this is supposed to be about breathing meditation? Where's the breathing? Absolutely no mention of it. It's the whole body, the *sabbakāya*.

The geography of the breathing is changing. We've been emphasizing the relationship to it—remember, we're always dealing with that dyad. You've got the mindfulness of, the awareness of X. So the mind and its object. These are in an interdependent relationship. If you change one, you change the other. If you change the relationship, you will find that the object itself changes. And this is, I think, what the Buddha was talking about.

The very geography of the breathing changes. Remember we talked about concepts. When I started doing breathing meditation, I had a certain concept about the breathing. For example, if you had asked me back in the day, "Where do you breathe?" I would

have said, without too much thinking about it, the lungs. And if you then said, "So, where are they?" I wouldn't have had a great deal of difficulty in saying, "Well, they're here."

Therefore, if someone says, "What I want you to do is to be aware of breathing," then where would I put my awareness? Obviously, here. But that's not the instruction. The instruction is, put it down here. Steady on—that's my bowels, mate. I don't breathe with my bowels. It's all wrong. What's the matter with you people? Haven't you studied science?

So there's a certain conceptual framework that we have with the whole thing, and that includes our sense of where the breathing is, but also even what it is. Well, it's in and it's out. I inhale, I exhale, that's it. Cool air comes in, warm air goes out. I read that in my high school science textbook. It's quite straightforward. But when you actually practice breathing meditation, it's not that straightforward. It's much more diverse than that.

Once we're no longer tethered to our concept of breathing, what we find is what the Buddha calls air element, or what in other traditions is called prana. We discover that this is actually throughout the entire body and beyond the body. The whole body—things are opening up now. The object of my mindfulness is not restricted to what I think breathing is, or where I think it should be, or how I think it should behave. It's completely different now.

We've dropped beneath concept. We're in the elemental realm of experience, and along with that, the rule book just got thrown out the window and suddenly everything is bigger than it was. So this is the whole body. Everything is opening out like it hadn't before.

And the body is the body of felt elements. It's not the solid two legs, two arms, torso, head that I used to think it was. I still think it is—but it's not necessarily the way that I directly experience it. Does that make sense? I'm glad to see that some things I'm saying are making sense. It's very encouraging.

"She trains herself to breathe in, calming the body construction. She trains herself to breathe out, calming the body construction."

So here again, we have breathing in, breathing out, but the focus of interest has actually passed beyond the breathing. The focus here is no longer the breathing. Here it's about calming, and calming the body construction, the kāya-saṅkhāra.

We've moved to the whole body, and from there we've moved to the body construction. Now the question is, of course, what the hell is the Buddha talking about? There are different interpretations you get for this. First of all, we have the term construction—this is saṅkhāra.

This is a key technical term that the Buddha uses again and again. It has different meanings in different contexts, which makes it more confusing. But in every context, what it refers to is the fact that whatever we experience is constructed, made up of parts, and in turn constructs and makes something up.

So, for example, this body is constructed. It's made up of different parts. This building is constructed. It's made up of different parts. All the bodies in it are constructed, made up of parts. But all of these things in turn construct and create something else. In this case, a dharma talk in a meditation retreat.

So there's this particular building made up of these particular parts with these particular group of people sitting in a particular way, looking in a certain direction, a fellow waving his pieces of paper around and talking about Buddha. And what you have constructed is a dharma talk in a meditation retreat. So this situation is a construction—it's made up of parts, and it in turn is constructed by different things, and each of those different things is in turn constructed by something else. You're starting to get the pattern? Everything's this complex network of systems and subsystems all relating together. This is saṅkhāra, this is construction.

So she trains herself to breathe in, calming the body construction. She trains herself to breathe out, calming the body construction.

Now usually the body construction is taken to mean simply the breathing, and it can be taken as that. Breathing is a construction, and in fact there's a reference in the suttas, in the Cūḷavedalla Sutta, that explicitly says exhalation and inhalation are the body construction. So you can read this quite legitimately as she trains herself to breathe in and out, calming the breathing. But I think there's something more to it than that.

Breathing constructs the body. Now especially—well, first of all, when the Buddha talks about the body, he's talking about the sentient body, the alive body. Sometimes he uses the term sa-viññāṇa-kāya. Kāya is body, viññāṇa is awareness or consciousness. And sa means with—a body with awareness, a conscious body, a sentient body. So this is a body, but it's a sentient body. It's a body that knows, that awares.

And this body is constructed—this being, and the world within which this being exists. So this sentient body sees, hears, smells, tastes, touches, minds. In doing so, it creates a universe, a physical and mental universe in which it occupies the center. I don't

know if you've noticed, but all of you are just bit players in my drama. Have you noticed that? You probably think that I'm a bit player in your drama. This is the nature of the sentient body. Each body is the center of its own particular universe, which is constructed.

So we construct ourselves as body, but this body is necessarily connected to a world. This body sees—there's a visible world out there. This body hears—there's an aural world out there. This body smells, and so on. So this sentient body by its nature occupies the center of an experienced universe. And this is a universe, a world that belongs to me. Because what's constructed out of this is me. Here I am in my world. And this is the construction.

Calming the body construction. The body calms because everything is connected. Everything bounces off everything else. When the body calms, the mind calms. When the mind calms down, the body calms down.

Have you ever, when you've meditated, gotten caught up in some emotional storm which is associated with a lot of thinking in which you create this vividly real world in which someone did something or will do something or is doing something? Ever done that? And have you noticed that there's one characteristic that this whole construction does not have, and that's calmness. There's a lot of energy to it.

When everything calms down, what happens to that world? It drops away. It ceases.

This, I think, is calming the body construction. It's like all of that drops away. And when it drops away, what we're left with is pure intimacy.

So when we go through this little paragraph, just a few sentences, and again it's an idealized template, what we see is a journey into the nature of experience using breathing as the vehicle, as our pathway.

If we were doing a meditation practice, what are we trying to do? We're trying to gain access into the sentient body, into the body-mind process. And we're trying to go as deep as possible into it. We need a vehicle. We need some way of getting in there. And that's our meditation object or objects as the case may be.

Now here the Buddha is talking about using breathing as the vehicle. And the journey is one of ever deeper and more refined awareness. So we bring awareness to what we normally don't even notice: breathing, which we take for granted. And then we cultivate mindfulness. We train ourselves to remember our awareness. So the continuity,

the felt continuity of awareness. Then we develop understanding. We get to know the details of what is happening, in this case with the breathing. We learn the patterns over time, how it behaves over a period of time.

So our relationship to the meditation object, here it's the breathing, changes, becomes more sophisticated. And therefore the meditation object itself changes. The breathing changes along with the relationship, because everything is connected. If we change how we experience, we change what we experience. So breathing itself ceases to be what we think it is, and it becomes something quite different. When we get beneath our concept of breathing, that takes us into the realm of what the Buddha calls vayodhatu, air element. And this spreads throughout and beyond the body.

And this relationship is one of increasing intimacy, from just breathing, to being mindful of breathing, to understanding breathing, to sensing breathing. And the sensing conveys getting really closer and closer and closer and closer to it.

And this intimacy takes us to other aspects of experience. When we're completely intimate, well, when we start this process, there's someone here, there's a self, there's a meditator or someone who wants to be a meditator or someone who wants to be a good meditator or a successful meditator or an enlightened meditator. So there's a self that stands apart from this process. I'm the one who's going to manage all this and at the end of it I'm the one who's going to be enlightened. So here is the process and here is me who's doing it and who's going to get the benefit at the end. And this self is constructed by the process.

How is it that I think I'm a meditator? Because there's this process going on and it's happening to me. So I'm a meditator. But as we become increasingly intimate and as everything spreads out, we realize there's nothing separate from this process. There is no one here who's doing this. It's just the process. And the self constructed by this whole process falls away, disappears. There's only the process.

So I think that's enough. I think we've come to the destination.

Any questions or comments?

"So when the self falls away, we don't have the dyad anymore?"

That's right. It depends. The dyad is just part of nature, like awareness and what we're aware of, what is present and the presence to it. What we don't have is the subject-object structure imposed on it. So me, my experience. We don't have that.

That's completely unnecessary. The dyad is still there, but it's no longer of any significance. I mean, the dyad is just a concept, and like every other concept, it gets tossed out with the garbage. So in that sense, we don't have it anymore.

But in particular, what we have is the dyad, but the way that we normally experience it is: there's me here and there's the object of awareness there. This is the subject-object duality. We impose that on top of the dyad. But actually, it's not necessarily part of it. It's something that we do—it's a construction. We add that to it.

And that's becoming intimate. When we become intimate, all of that starts to crumble. It just falls away. It can't be sustained. It cannot be sustained without a sense of separation, without a sense of distance—here's me and this is the show. Once that falls away, then that whole structure necessarily falls away.

And you get this cluster of terms that the Buddha uses, built on the root vid—sometimes vedati, sometimes vedayati—and they all convey this sense of intimacy, of getting closer and closer. But we'll explore this a bit more tomorrow night.

This also opens up the whole realm of affect, of the heart. It's like when I start, it's all up here. I've read the right books and I've got the right technique and I've got the idea of what I'm supposed to do, and it's all up here. But when I get into it, all that eventually drops away and it's here. This is the journey into intimacy.

"So do you see there's a persistent state where this subject-object duality is broken down? Or do you, like the Buddha said—there's nirvana with remainders and nirvana without?"

There are experiences where it just completely drops away. But of course, you can't live like that. It's difficult to have lunch like that or drive a car like that. So you come back into the normal structures of experience, but you experience them quite differently. You know that they're fundamentally arbitrary and contingent, so you don't believe them. You use them, but you don't believe them.

If you look at the stories about the Buddha, the Buddha had a clear sense of identity. He knew exactly who he was, and he knew how people were supposed to behave towards him and how they weren't supposed to behave. So when he was dealing with recalcitrant students, he knew when a student was behaving badly and he would respond appropriately, often just by walking away.

So he had a self-structure and he had a social world within which he played a particular role, but he didn't believe it in a fundamental sense. He knew this is just a game. But it's a game I play because if I play it this way, I can reduce suffering, and therefore

I'm going to play it this way. Because he could have played it some other way—by just staying in the forest and not teaching and just enjoying himself. That would have been another game. But he chose a particular game to play because he wanted to reduce suffering. Out of compassion, he played this particular game. But it was just a game, as opposed to thinking "this is me."

"The instructions that one normally hears—I always heard 'the full body of the breath' means the full body of the breath, like it's up here, and you'll get the whole process of the breath, the full body of the breath, rather than being in the body as you were discussing it, as you were explaining it. I've never heard it like that."

In the Theravada orthodoxy, they ask the question: what is the sabbakaya? The whole body. And the commentator says, "Well, it's the whole body of the breath." It's like they're wrestling to keep the breath in there. And because the commentary says it, then any respectable orthodox Theravadin will say that, and therefore the meditation instructions coming out of the orthodoxy will repeat that, even if—let's say the person giving the instruction is an accomplished meditator and knows perfectly well that actually the experience is quite different. Their job is to hand over the orthodoxy.

I think one of the problems that you find in, certainly in Theravada, but I suspect in other traditions as well, is that you get the great commentators, the famous names who have written the books. These people are academics. Maybe they've done meditation. Maybe some of them are even good meditators. But really, these are academic presentations.

"You're talking about the Abhidhammas and the Abhidhangas and all that sort of stuff?"

Yeah, and Buddhaghosa in the Theravada and so on. So philosophically, I think when you're working with Buddhist philosophy, you've got to take it with a grain of salt when you're coming from a practice angle.

What works philosophically doesn't necessarily work practically. So what we do, at least what I do, is study the text, study your own experience, and bring them together.

What you want is to be faithful to the tradition. That is to say, for me, I ground myself in the Buddha. But how do I know what the Buddha taught? Well, I've got these texts and I've got a living tradition. And I read that against my own experience and I bounce back and forth between the two. I check both and I ask myself, does this reading of the text work? Does it make sense of my practice? And does it give me somewhere to go? And when I go in that direction, is that helpful? Okay, then I'll use this reading.

Now, historically, I don't know if that's what the Buddha meant. Nobody knows. That's two and a half thousand years ago. Who knows what the Buddha meant? What we've got is these teachings and my experience. And we bring them together. And when we do it openly...

Then you get the chance, like in this practice community. So I'm telling you, I'm giving you this riff, and I'm telling you straight out, this is my interpretation. And when I deviate from the orthodoxy, I will tell you that I'm deviating from the orthodoxy. Then you can make up your mind. You can decide, look, this guy is off on his own trip. It's very entertaining, but I'll stick to Buddhaghosa, thank you very much. Or you might say, oh, that's interesting. Maybe there's something else happening and maybe I should take a look and find out.

So when you have that—you have a dialogue in a practice community informed by the tradition—then you get something worthwhile happening and you have a practice community which is learning as a group, not simply obeying orders. And especially in a group like this where people have experience. You're not in kindergarten.

Just in terms of Mal's point, and to support your interpretation, the idea of the sabbakāya being the whole body of the breath, if that was what it meant, it's really just repeating the previous instruction. Breathing in the long breath, I know that I'm breathing in the long breath, not the short breath. If I'm doing that, I'm already following the whole body of the breath. So it makes sense that the next one has a broader meaning.

One reason I just avoided this passage for decades was that it just never made any sense to me. So I just didn't talk about it. And when I decided I was going to talk about it, I really had to kind of jump right into it. But the traditional interpretation doesn't make much sense to me.

I found it interesting in the two different translations, the Bodhi translations of the Majjhima Nikāya. In the 1995 version he says, "body of breath." And in the 2005 version he says, "the whole body." When you look at Bhikkhu Bodhi, you can see him evolving. And you can see, go back to his teacher, Nyanaponika. I used to read Nyanaponika's translations in little pamphlet thingies. And I'd be reading—this was the first time very early, back in the 70s—I'm reading the Buddha's words. And every now and again, this is a really obscure passage. And mercifully, there's a footnote. And I go down to the bottom, and Nyanaponika writes, "Commentary says, blah, blah, blah, blah." And it's all explained.

And after a while, I thought, wow, this guy "Comy," he seems to know everything. Every time Nyanaponika Thera's got a problem, he goes to "Comy." And "Comy" tells him what the answer is. And it took a long time before I realized that "Comy" was short for commentary.

So for Nyanaponika, operating in the 40s and the 50s and into the 60s and so on, what the commentary says it means is what it means. When you look at Bhikkhu Bodhi's early work, and some of it is with Nyanaponika, he's doing exactly the same thing. If you look at his later work, he'll tell you, this is what the commentary says. Personally, I think it means this. And he'll give you his own interpretation, but he'll always tell you what the tradition says it is. So he always treats the tradition with respect.

I'll give you what the tradition says. But if I think it's wrong, I'll tell you I think it's wrong and I'll tell you why I think it's wrong. So he's stepping out of the orthodoxy but still with this attitude of respect for the tradition.

I think that's really important. I think when people lose that respect and they just head off on their own tangents, you just get the fashionable stuff that floats around and you can attract a few students but...

Well, many years ago, Sayadaw Upandita had a room full of foreign meditators, and he knew that a lot of them were going to end up being teachers. And he said to us, "I can tell you how you can be enormously successful as Dharma teachers. You can have a huge number of students and make buckets of money. And the way you do it is very simple. What you do is you teach our Dharma. A-dharma. A is the negative prefix. You teach not-dharma. You teach anti-dharma. And you will have many students, be enormously popular, and make lots of money. On the other hand, if you teach dharma, you will have few students, not be popular, and not make much money."

And I think he's right.

Thank you very much. Thank you for listening.

CHAPTER 6

Tracking Breathing

Patrick Kearney · 57 min

> *Patrick Kearney leads a series of playful meditation experiments focusing on breathing as a meditation object, encouraging practitioners to investigate the actual movements and sensations rather than conceptual ideas about breath. The session explores where breathing movements are most clear in the body, their direction and qualities, and the relationship between awareness and the physical process.*
>
> *The teaching emphasizes working with the air element (vāyo-dhātu) rather than the concept of 'breathing,' drawing from early Buddhist understanding of the four elements. Kearney discusses the challenges of interference with natural breathing patterns, the power of conceptual overlay in meditation, and how different approaches suit different practitioners—from detailed investigation to whole-body awareness.*
>
> *The discussion addresses practical concerns about controlling versus observing breath, the relationship between mindfulness (sati) and natural breathing, and how precision in awareness can develop both concentration (samādhi) and insight into impermanence (anicca) and non-self (anattā). This experimental approach offers valuable insights for both beginning and experienced practitioners working with ānāpānasati meditation.*

This morning we're going to play with using breathing as meditation object. We'll start with a number of experiments and then we'll have a discussion afterwards.

Treat these exercises as games. Don't take them seriously. I think the more playful you are in your attitude, the more likely it is that you'll get some benefit from them. Whatever happens is what is supposed to happen.

If you get into your meditation posture and begin by being aware of the whole body, opening your awareness up to the whole body. Now look for the movements within the body that are associated with inhalation and exhalation. Where are these movements clearest and most obvious to you? In the belly? In the midriff? In the chest? In the throat, shoulders, head? Start to focus on wherever these movements are clearest and most obvious to you.

If there are movements, they must be going in some direction. In what direction do these movements travel? Are they vertical? Are they horizontal? Are they curved? Do they expand and contract? Focus on direction. In what direction do these movements travel?

Let's assume we have two movements, one associated with inhalation and one associated with exhalation. Is the movement associated with inhalation longer or shorter than the movement associated with exhalation? Is the movement associated with exhalation longer or shorter than the movement associated with inhalation? Or are they both equally long or equally short? Focus on length. Which one is longer? Which one is shorter? Or are they the same?

Is the movement associated with inhalation clearer or less clear than the movement associated with exhalation? Is the movement associated with exhalation clearer or less clear than the movement associated with inhalation? Or are they both equally clear, or both equally obscure? Focus on clarity. Which one is clearest? Which one is least clear?

If there are two movements, then each movement must have a beginning and an end. Can you see the beginning and the end of the movement associated with inhalation? Can you see the beginning and the end of the movement associated with exhalation? Or are you missing parts? And if so, which parts are you missing? Focus on beginnings and ends.

These exercises require precision and detail in your awareness. As you attempt them, do you feel any sense of strain in the mind? Do you feel any tension in the body? Do you find yourself interfering in any way with these movements? If any of this is happening, step back from the details of the breathing and relax. Watch the movements. Don't do the movements.

Or if you realize you can't help but do them, then watch the mind that is doing. Make your relationship to the movements your meditation object.

And again, open your awareness to the whole body. Take your awareness back away from the detail of the movements and rest in the whole field of the body. Just feel any sensation or any movement that's occurring throughout the body and be aware of the general field of the body. No need to focus on any particular thing. Just on the experience of sitting here now.

So, where did you find the movements? Where were they clearest and most obvious?

"Nostrils."

All the time? Consistent?

"Sometimes the whole process. So sometimes just the nostrils, sometimes the whole process."

Anybody else?

"Ribcage. Consistent throughout—in breath, the ribcage, out breath."

"Wherever I focus, that's where I feel it. So if I focus on my stomach, that's where I feel the breathing. Focus on my ribcage, that's where it will be. If it's on my neck, I'll feel it there."

So did you play around with different places? Did you settle on any one thing eventually?

"No, I sort of held it there. It's up to me what I want to do."

And anywhere works? It doesn't matter where it is?

"It does. It actually came to the nostrils, came to the back of the throat, all the way down, out. It's fine everywhere. It can actually be anywhere. It depends on my focus."

"When you said, 'where do you find the movement,' I found it everywhere. I was looking at it, it was like a chain. The movement of chains. But then when you said, 'where do you find it strongest,' the whole thing changed. Of course, I found it strongest in most of my abdomen, and my nose, this area—this whole area."

So the movements themselves are everywhere, but there's a clear, distinct area where they're clearest and strongest.

You notice in these exercises—they're exercises on breathing meditation—and I try to avoid the word "breathing," and I minimize any use of the words "inhalation" and "exhalation." That is for a reason, but we can talk about that.

Where do the movements go? In what direction?

"Up, down."

Vertical? Straight up, straight down?

"Not straight—bendy up and bendy down."

"Mine was up in breath. Up and then out. Out from down there. So up and then out from down here."

"And the back was down. The shoulders were down."

"I just had like a slow-motion flower image."

Expansion, contraction or opening and closing? So going in all directions?

"Opening in all directions and closing in."

"So I didn't feel breath."

This is precisely the richness I hoped to explore through this investigation. When you asked about direction, I found I could focus on various places. I had the concept of 'in and out,' but this felt somewhat forced, because when I actually experienced the sensations, nothing was going anywhere—it was simply vibrating. It was like a gentle pulsation, just this rising and falling sensation, rather than any movement in or out.

We tend to conceptualize it as 'in and out' because we're thinking about the breath as an idea. Did you find direction significant for you?

Well, there was an up and down quality, a vibration. Direction wasn't particularly meaningful for me. When I focused on the abdomen and torso, there was definitely expansion and contraction. But when I attended to the tip of my nose, there wasn't any particular direction—just vibration and sensation.

Now, which is longer—the inhalation or the exhalation? And which is shorter?

The exhalation feels longer than the inhalation. How many would agree that the outbreath is longer than the in-breath? How many would say the in-breath is longer? How many would say they're equal? And how many would say 'all of the above'?

It's fascinating when we have these discussions—the variety of experiences people report, including how any one person can have completely different experiences over time.

In my instructions, I deliberately say, "Let's assume there are two movements, one associated with inhalation and one associated with exhalation." I phrase it this way because I used to simply state, "There are two movements." Then one day, someone at exactly this point in our exploration said, "That's incorrect. There aren't two movements. There is only one movement."

How many would agree with that observation? That there aren't really two movements, but actually just one continuous movement?

I notice that when we began discussing beginnings and endings, some resistance arose. I didn't want to go there immediately—we haven't reached that investigation yet.

But it's on the same lines of what you're asking. So, a single movement. Yes. You have this sense of the unity of just one movement. Anybody else know just one movement?

"It's like a loop."

A loop. So it's not one-two, it's just one single loop.

"Once I started to concentrate on the beginning and end, that was really aggravating. The loop was more comfortable."

So let's move on to beginnings then. Peter, you just totally objected to the beginnings.

"When you said I didn't want to go to beginnings and ends, I made myself do it, but really I was quite happy with not having a beginning."

When you made yourself do it, what happened?

"I got it. It felt a little bit uncomfortable."

Did it feel artificial?

"Yes."

This is an example of the power of suggestion in meditation practices. If you're told, "Look, there's X, so go and find it," you look for it, and you might not find it. But you convince yourself it's there, and then the mind can conjure it up. This is quite an interesting aspect of meditation practice—the power of suggestion. To what extent is my experience real, or to what extent am I just inventing it? Or does it make no difference? Even if I'm inventing it, if I'm experiencing it, then it's real. It's quite an interesting area. It's a question of how you conceptualize it.

The idea of beginning and ending—these are concepts. It's a way of organizing reality, thought, experience along various dimensions which may or may not have validity. So we've been talking about the power of concept. It's like there's something going on.

The Buddha's basic stance is this: he says, "Look, there is something out there. There is something going on. It's just that it's not what we think it is." Because we operate in this world of concepts. And the more you actually look at this, the more you see how deeply entangled the concepts are with the experience. And this kind of exercise demonstrates that.

The whole question becomes: is this a concept of something, or is it really something? In the Buddha's language, have I actually hit the elemental level? When we're talking about breathing, that's a concept. What's underneath it is air element. We played with the elements yesterday, and there we were looking for movement, which we called air element.

But really, when we're doing breathing meditation, the object of the meditation is not breathing. Breathing is a concept. The object of meditation is the air element and the way that the air element moves around.

So, Mao's description—"Movement. Well, it's everywhere"—he conceptualized it as qi, as prana. But when you ask, "Where is it clearest and most obvious?" it resolves down here, somewhere in an area which we would recognize as breathing. But these are just concepts.

When we do the meditation practice, we use the concepts. But it's really important not to get trapped in them and to actually get at what is actually happening—not my concept of it, but what's actually going on.

We could have philosophical debates about whether or not it's possible to have a non-conceptual experience. People do have philosophical debates about this. But for our purposes, sending awareness in the direction of "Let me get beneath the concept to the elemental quality underneath"—that sends awareness in the correct direction, in the direction that we want to go as meditators. Whatever is there, we're getting closer and closer and closer to it. And we're getting further away from the way we habitually conceive it. That's the key.

What we actually come up with doesn't really matter. Whether it's clearer or not clear, longer or not long, or what direction it is and so on. All this is trivia, actually. What's important is that sending the awareness deeper and deeper, becoming more intimate with the more elemental quality, becoming more and more intimate with the experience.

Kim raised a fascinating point about touch points. "Many years ago I was given instructions to watch touch points, and I always found it fascinating that regardless of whether there was a sensation at those points, the mind was still able to go there. It was sort of like the awareness of a place in the body as opposed to a sensation. But it worked really well."

"So that was conceptual, very much so, for a lot of the time that I was doing it. And I always found that fascinating."

"Why was it conceptual? What made it conceptual?" I asked.

"Well, the mind was imagining a spot. Because the eyes were closed, so to say, it was the kneecap. Quite often there'd be no sensation whatsoever."

"But you had a sense of the awareness in space and you knew that that was the kneecap?"

"Yes. So the mind was doing three points. The sitting and the whole body. Sitting, left kneecap, right kneecap."

So you could put your awareness in a space. Conceptually you knew this is the left kneecap, that's the right kneecap, even though there was no sensation. You could say you were using the concept to aim your awareness. But I would say you did have a genuine, non-conceptual experience—basically a space element.

The Buddha talks about awareness lands. There's a sense in which awareness has location, which is quite interesting. So this is bound up with body. I am aware of you, but my awareness of you has location. It's here. I'm not aware of you from over there. I'm aware of you from here, which is bound up with body—the fact that awareness and mind and body come together as a package. But there's also a sense of the object of awareness. My sense of you is over there, so space.

There is this quality of space. I think strictly speaking, space is listed as one of the elements. The Buddha lists space as one of the elements. If you use sound as a meditation object, you get a sense of space. You can have a sense that this sound is close but that sound is further away. So you have a sense of extending out the space element. I think what you're talking about is working largely with space rather than with sensation.

"I've been instructed, the breath had disappeared at the time that the teacher said to do this."

That makes sense.

Another student mentioned something about the directional aspect of breathing: "Even though we're not interfering with the breathing, I'm always aware in varying degrees of a point at the top and bottom of intention."

"Intention?"

"Yeah, I think it's because if you have hiccups, you hold your breath. So even if you're not trying to control it, there's a whiff of an awareness that I'm changing now."

Ah, I see. You mean the actual move into... People who talk about this say that intention is most clear on the inhalation. One person said that when he was doing these exercises, he grew quite alarmed because he would exhale and then he's just following the movements, and then there's nothing happening at all.

And then suddenly there's a moment of panic because the mind knows, if I don't breathe, I'll die. There's a moment of panic and the inhalation begins. And he didn't find an intention for the exhalation, but he found it very clearly for the inhalation.

So that's another aspect you can play with in terms of breathing—where's the intentionality of it? What role does that play? Is there a decision to end a movement? And again, it doesn't matter what answer you come up with. As a matter of fact, that you're asking the question, that you're interested in the question, means that your awareness is being directed towards a subtle object. And the mere doing of that is making your mind clearer, sharper, more subtle, more refined. So it's helping the meditation process.

Interest and curiosity are really important. In the factors of awakening, of course, the second one after mindfulness is investigation of phenomena. Now this often, for all intents and purposes, means curiosity. So if you have that curious interest, then you're stimulating that awakening factor.

When you think about the point of non-interfering, because in contemporary psychology, as you know, they talk about controlling your breath. In fact, if you want to increase your heart rate variability, you do a longer out-breath than in-breath, and you time it. And I know in yoga too they also talk about controlling the breath. And there's been a few debates that I've had on the internet with other psychologists about how it's no control. Mindfulness of breath is that relinquishing control completely.

And so I find that when I'm doing mindfulness of breath I'm very conscious of letting go. And then noticing how short the inhalation is compared to the exhalation. Because I've been studying that controlled breathing and all that sort of thing. So my thoughts are that when we relinquish control, it helps us understand ananda. And when you control that, it creates that illusion that you actually have control.

Before we get onto that, let's raise a question about interference. Did anybody feel that they were interfering with the breathing?

"When you suggested finding the beginning and end, I found that that suggestion actually created that sort of movement or intention to find it. At the time the breath was very subtle and I just noticed this very subtle shift to then, oh, yeah, I've got to find it, just that mind movement."

"Yeah, moving closer in and then trying to... it wasn't actually there, there wasn't actually an ending for the exhalation, but then I noticed myself becoming more forced, the breathing."

"Did you create an end in the end?"

"I did, in the end, yeah. And I noticed that then it became... the breath became less subtle again, and more gross, and yeah, I realized I was straining a bit."

So did everybody hear what Robin was saying? That the breathing was very refined. Then when I said find beginnings and ends, then the sense of strain came in, leading to actually creating an end to be found. This is a classic description of how we can easily interfere with the breathing. And breathing is very easy to interfere with.

Sometimes I ask this question: do you notice that you're interfering with the breath or not? Some people say yes. "When I'm trying to be detailed with it and I notice that I interfere with it, it gets disturbed." Some people say no. One person objected, saying, "Look, since the only possible awareness I have of the breath is when I'm being aware of it, how would I know what it's like when I'm not being aware of it? So it's impossible to say if I'm interfering with it." I thought, well that's an interesting response.

But sometimes you do get this sense of interference. I get the sense that the breath becomes disturbed. If I focus on it, it becomes disturbed. So I know that the awareness is interfering with it. But breathing is particularly sensitive to the state of the mind. This is well known among people who talk about breathing meditation. So if I get agitated, my breathing will become agitated. If I calm down, my breathing will calm down. If I want to calm down, one way to do it is to calm my breathing, and I will calm down. So there's this well-known link.

So this raises questions about whether we can deliberately interfere with the breath to improve the breathing meditation experience. For a certain proportion of people, they simply cannot do breathing meditation unless they interfere with their breathing.

Some practitioners, year after year, fall asleep every time they attempt breathing meditation. They struggle and strive, but it makes no difference. They can be completely awake, walk into a meditation hall, follow the instructions, focus on the breathing, and five minutes later they're unconscious. There's nothing they can do about it, and it's incredibly frustrating.

My hypothesis is that these are shallow breathers. When you begin to meditate on breathing, the breath naturally becomes more subtle and refined. They quickly reach a point where they're not getting enough oxygen, and the brain simply turns off. The only way they can practice breathing meditation is by deliberately interfering with the breath. The simplest method is to extend the exhalation—that's one of the standard approaches.

From a meditation perspective, deliberately breathing in some particular way is neither necessarily good nor necessarily bad. In certain circumstances it's useful, and some people find it extremely beneficial. Some of my students use it to develop concen-

tration. They count their breaths and can tell you precisely: "In one hour I will breathe X number of times." When it drops beneath a certain number, they know they've achieved good concentration. People can be very precise with this approach.

For others, attempting such techniques creates hopeless confusion. For me, it doesn't work. I have a very problematic relationship with breathing—lifelong asthma, bronchitis, and so forth. I don't like breathing as a meditation object. I've never liked it, and I can't do that kind of precise manipulation. At least I haven't been able to up to now.

As for whether this relates to mindfulness—I don't think it has anything to do with mindfulness itself. Mindfulness is remembering the breathing. Whether the breathing is completely natural and uninterfered with, or whether it's artificial, neither of these is the mindfulness. The mindfulness is remembering whatever it is—staying with it over time, whatever form it takes.

In developing your own meditation practice, it's up to you to discover what works best. Does it serve you to have a relationship where you don't interfere with the breathing?

There's another consideration Mel mentioned: if I don't interfere with the breathing and simply allow it to be what it is, that encourages the perception of anatta. If I deliberately breathe and develop good concentration as a foundation, that's not cultivating the sense of anatta. It may create a sense of someone back there who's doing it, subtly reinforcing that perception. These are side effects to consider.

But in terms of your individual practice, what relationship to breathing works best for you as a meditator? This will be different for different people.

I find it does change over time. If you can make the choice—"I'm not going to do anything with it, I'm just going to be aware of it"—I think it's a valuable exercise. It's particularly interesting and challenging for me.

What this means is I can't be too detailed with the breath. If I engage in very precise exercises, the tendency to interfere, to shake it up a bit, becomes overwhelmingly strong. I have to step back and create a sense of distance.

Personally, what I do is make the whole body the object, and within that there's the movement of breath. But I'm not making the breath movements the primary focus.

I make the whole body the focus, and that works for me.

Student: So the purpose of the detail is?

Teacher: Again, you notice that we're practicing precision.

Student: So it's for concentration?

Teacher: It's for developing insight. Precision gives you details that you don't otherwise get, and the details change. Precision gives you the perception of impermanence. But equally, the effort that you make could create a sense of self. So it's always a balance between the different aspects.

Student: If you were observing the desire to interfere with the breathing, or the recognition that "this is when I could interfere with the breathing," then that is intention, and that's creation that leads into the whole creation of what you're doing—you're creating things, creating karma. But why is it more "creating something" than doing anything else?

Teacher: Because you're aware of it. Normally, during the day, I don't have intentions to breathe or to hold my breath. I don't notice intention. It must be there, but when I'm doing breath meditation, I notice the intention to breathe or the intention not to stop. And then there's an intention—oh, yeah, I get it.

Basically there you're watching mind rather than breathing. So it's the mind-body thing. If you're just watching movements, you're on body. But if you're watching your relationship to the breathing, it's actually mind—it's your meditation object.

Student: It's going to sneak back there, isn't it? It's sort of more interesting.

Teacher: For some. That's a very smart answer. Watch this—it's not quite as boring as I thought it was. And so if that's your natural inclination, why not? Then the breathing operates as a support for your investigation of the mind.

Student: But we can breathe without any tension, and I normally do. This is when I'm meditating, suddenly... What I find is that in certain circumstances I have this longstanding habit where I forget to breathe. This is in normal everyday life. I'll be doing something that involves some degree of tension, either physical or mental, and what I would notice is that I'm doing something and getting more and more agitated and frustrated about it, even though the objective situation is such that—why am I getting agitated and frustrated about it? And I suddenly realize that in the focus on this, I've forgotten to breathe. The longer I do that, the more agitated I become. So I've trained myself to notice when I forget to breathe.

Now I don't know if this is because of my background with asthma or whether it's a more universal thing, but I frequently forget to breathe.

Teacher: But you do remember eventually.

Student: Yeah, eventually.

Teacher: You survive thus far.

Student: Yeah, but only just. But if you didn't remember, your body would just breathe anyway because it's not actually you breathing.

Teacher: No, it doesn't breathe. It stops breathing. And you fall down.

Student: If I was determined enough, eventually I do start again. But there's a period of time when I'm not breathing which has no reason why I shouldn't be breathing except that I've forgotten to do it.

Teacher: No, I think everybody actually does that because it's a stress reaction. A lot of people do that.

They clamp up and stop breathing. That's why I tell people who are really stressed to just stop, calm down, and take a deep breath—then hopefully they can find some relief.

This is actually why, in our stretches, when we reach that point—the edge where you're encountering the barrier—I always say breathe and relax. Because that's precisely when people stop breathing, when there's tension.

As a matter of interest, when I did sessions with Holi-san, he would work with breathing exercises that I could never manage. It was like working with the *mu* koan—he would have us breathe in for a short period, maybe thirty seconds or so, then breathe out for an extended time. This practice has much to do with calming and focusing attention, being substantive rather than scattered. Apparently it's a very effective samatha technique, though I had great difficulty with it.

When you opened up to the whole body, how did that experience unfold for you?

"For me, after the forcing of the breath, it was like a relief—I could go back to just breathing naturally again."

And is that more your natural style, this opening up and relaxing approach?

"Less effort. It requires much less effort."

So you found it less effortful?

"Maybe I interpret it as finally being able to rest. Opening up to the whole body feels like having a rest."

Could you maintain clarity of mind? Were you able to stay with the meditation object, or did you begin to drift?

"Yes, that's exactly what happened."

This points to one of the fundamental dynamics in practice. There's this ongoing choice between needing something specific to hold onto versus the tendency to drift. Some practitioners don't need a particular anchor—they can work with a general field as their meditation object quite successfully. By "working," I mean the mind remains clear, mindfulness stays continuous, and concentration develops naturally.

But for other meditators, when they open up, while it feels very pleasant, they become lost. And even for the same person, at certain stages of practice, opening up leads to wandering, while at other stages, opening up works perfectly well. Sometimes the mind simply refuses to hold onto a single object and insists on expanding awareness—and that's completely appropriate.

This depends entirely on where you are in any given moment. But it does illuminate these two fundamental approaches available to us: we can either focus inward on a specific object, or we can step back and open awareness outward. Broadly speaking, these are our two primary choices.

Which approach to take depends on circumstances. Sometimes it's most skillful to focus narrowly and precisely. Sometimes it's most beneficial to step back and expand upward and outward. Part of developing as a meditator involves learning when to apply which approach.

There's more than one way to approach this practice skillfully.

Any questions or comments before we conclude?

Thank you all very much for your attention and participation today.

CHAPTER 7

On Vedanā

Patrick Kearney · 1h08

In this comprehensive dharma talk from a month-long retreat, Patrick Kearney provides an in-depth exploration of vedanā, the second foundation of mindfulness. Drawing from the Satipaṭṭhāna Sutta (MN 10) and the Cūḷa Vedalla Sutta (MN 44), he examines how vedanā functions as the affective dimension of experience that underlies all our responses to the world. Kearney distinguishes between the cognitive and affective aspects of Buddhist psychology, showing how vedanā is intimately connected with contact (phassa) in the six sense fields and precedes both perception (saññā) and intention (cetanā). He explains the three types of vedanā—pleasant (sukha), painful (dukkha), and neither-painful-nor-pleasant (adukkha-masukkha)—and how they condition the fundamental movements of attachment, aversion, and delusion. The talk includes practical guidance on vedanā-anupassanā (contemplation of feeling), emphasizing how this practice requires cultivating intimacy with our subjective responses rather than conceptual understanding. Through examples from meditation practice and daily life, Kearney demonstrates how vedanā creates the world that has the power to move us, serving as the foundation for all our perceptions and decisions.

This morning we had a brief experiment on vedanānupassanā, the tracking of vedanā, of feeling, and then we had a long complicated talk about it. Tonight we're going to have another long complicated talk about vedanā, just to go over what we've done but also take it a bit further.

In the Satipāṭṭhāna Sutta the Buddha says, "How does a practitioner live tracking feeling as feeling? Here a practitioner sensing a pleasant feeling understands she is sensing a pleasant feeling. Sensing a painful feeling she understands she is sensing a painful feeling. Sensing a neither painful nor pleasant feeling she understands she is sensing a neither painful nor pleasant feeling." This is the opening section of the sutta, and it introduces feeling, vedanā, and the notion that there are three basic ones: pleasant, painful, neither.

When the Buddha talks about the human being and the human condition, if you look at the language that he uses and at the structure of his teaching, he distinguishes and talks about two aspects of the person: the cognitive and the affective. The cognitive is what we would call the realm of the head—all about concept, thinking, cognition, and so on. The affective is the realm of what we would call the heart: mood, emotion, and so forth.

You can see it in the way some of his key technical terms pair off. I've done a little table with a cognitive term on one side and its affective counterpart on the other. For example, the fundamental problem—why it is that we have to practice—is because of avijjā, ignorance, delusion, or moha, which is another word for delusion. But then sometimes he talks about the basic problem as taṇhā, thirst, craving. This is the heart, the drivenness of the heart. So delusion, ignorance—that's cognitive, up here. But craving, drivenness, is down here in the heart.

Similarly, we have the two sides of the solution: cognitive paññā, wisdom, understanding—again, cognitive. Or also saddhā, which is inadequately translated as faith. Saddhā—dhā is to put or to place, and saddhā comes from an old Vedic word for heart. So it's where we place the heart, and again, affective. In one discourse, which we might look at later in the retreat, the maturity of wisdom and the maturity of faith become interchangeable. They're like two sides of the same coin—distinct, but interconnected.

The Buddha will talk about vijñāna, awareness, knowing something, awareing something. And he'll talk about vedanā, feeling, feeling something, which we played with this morning. He'll talk about the asaṅkhata, the unconstructed—sometimes you see it translated as unconditioned. To recognize the unconstructed is an aspect of wisdom, definitely, and the flavor of it is cognitive: "Ah, it's unconstructed." And then you have the term nibbāna, which we've spoken about, and that is an affective term. This is the cooling of the heart.

So the Buddha has this view of what it means to be a human being, which encompasses both head and heart. Some terms come together like citta, which is a key technical term, usually translated as mind, but that includes what we would call the heart as well. When we talk about mind, we tend to think up here, but citta is just as much here, in the heart. Sometimes you see it translated as heart-mind.

We have the realm of cognition—knowing, understanding, or not knowing, not understanding. And then you have the realm of affect, and this is that which moves us. When we spoke about vedanā this morning, we compared it to the flavor of the experience, like the flavor of food. So when we eat food, we experience the physical sensations: smoothness, crunchiness, hardness, softness, hot, cold, and so on. And we also experience the flavor. The flavor is not the sensation but it's intimately entwined with the sensation. We could say that flavor is what moves us—when I get up to take seconds, I am moved by the flavor.

So vedanā is that aspect of experience that moves us, that provokes some kind of response. There are three basic flavors, according to the Buddha: pleasant, painful, neither painful nor pleasant—sukha, dukkha, and adukkha-masukkha. These three basic flavors are closely linked to the three basic movements of the citta.

Attachment, the movement toward an experience to hold on to it. Aversion, the movement away to get rid of it, to avoid it, to reject it. And then delusion.

Delusion is more complex. The first two are a simple binary: toward, grab; away, reject. And of course these go very deep, as we know. We talked about the evolutionary impulse—even an amoeba can do this, moves towards something to hold on, recoils from something that it doesn't want. Every living creature does this, every animal does this. It's absolutely built into the circuits. So these first two are both quite obvious, and part of their obviousness is you can see how deeply they must be embedded within us.

The third one is more complex. The third one can be ignorance, simple not knowing. So we could say not noticing. What do I notice? I notice what gives me pleasure or what gives me pain. These are important.

So if you're wondering what would be worth reporting when I have my meditation interview, and if you've just come off several hours of intense bliss, would that be a possible candidate? Yeah, that would be interesting. Or alternatively, if you just came out of several hours of misery and anguish, would that be a candidate? Yeah.

So pleasure and pain grab our attention, they grab our interest. If something isn't apparently pleasurable or painful, we simply ignore it. We just don't notice it. It's like effectively not there. So we are ignorant, simply not knowing. Or if we do notice it, we don't know what to do about it. Should I grab this or should I reject it? Maybe I should grab it, or maybe I should reject it. So we are moved to dullness and doubt and confusion.

But whatever flavour it is, what they all have in common is that we are moved in some way.

We mentioned this morning that vedana, like the English word feeling, functions as both a noun and a verb. As a noun, feeling can indicate what we experience: "I am in touch with my feelings." So it's something that I can find and experience. Or we might use feeling as a verb: "I think that's a good idea, but I can't help but feel that it would be a complete disaster." So there it's not a something, it's a way of experiencing which runs parallel to ordinary knowing. It's not the same, but it's not a something that we experience—it's a way of experiencing. And some people are more familiar with it than others.

So there's an ambiguity, even indeterminacy, in this concept of vedana. And it goes right back to the root of the Pali word. Vedana is derived from the root *vid*, to know, via the verb *vedati*, which means, according to the dictionary, to feel, to experience, to sense. So you can see there are different translations possible, and each one of them has a different connotation. They're not exactly the same.

So one of the problems is that it does create multiple possibilities of translation, which makes it hard for us, because we're operating in English. For example, that very simple passage I just read out from the Satipatthana Sutta, which I've translated here as "a practitioner sensing a pleasant feeling, sensing a painful feeling, sensing a neither painful nor pleasant feeling." You could translate as "feeling a pleasant feeling, feeling a painful feeling, feeling a neither painful nor pleasant feeling." That's a perfectly valid translation.

You could say "experiencing a pleasant experience, experiencing a painful experience, experiencing a neither painful nor pleasant experience." That would be a valid translation. Or you could say "sensing a pleasant sensation, sensing a painful sensation, sensing a neither painful nor pleasant sensation." And that would be a valid translation.

But they're not quite the same, are they? Even the most basic statement has this quality of being difficult to actually pin down. The other thing which I found about these is they're pretty redundant: experiencing an experience? What else did you do to an experience anyway? You could ignore it...

Often that's the best.

Let's look at how the Buddha speaks of the location of vedana, and we might get a better sense of where he's coming from. Vedana is intimately interwoven with the immediacy of experience.

The Buddha says the six sense fields condition contact; contact conditions feeling. So the six sense fields—this is one of the two major ways in which the Buddha analyzes the human being. Sometimes he'll talk about the human being as five bundles or aggregates, khandhas, and sometimes as six sense fields. He'll do this in different circumstances for different purposes. Later in the retreat we'll have a look at this.

But basically, if you look at the sense fields, what I am, what we are, is a kind of locus of sensitivity. There's this area here which is sensitive to data which strikes it. And there are six ways in which data strikes this sensitivity, or this bundle of sensitivities, which is me. There's a sensitivity to form—visual sensitivity—or the sensitivities of see-

ing, hearing, smelling, tasting, touching, the five physical sensitivities, and minding, the one non-physical sensitivity. Each sensitivity is a receptivity to its corresponding sense data.

So, for example, the eye—as in E-Y-E. When the Buddha talks about the eye, he's not talking about this eyeball, which, you know, if a doctor's talking about the eye, this is what he's talking about. But when the Buddha talks about the eye, he's talking about a felt sensitivity. There's this body, which is here, inescapably with me. And this body is sensitive. There are two little parts of this body that are sensitive to light. I've experimented with this and I can say with absolute certainty that my feet are not sensitive to light. They have no idea whether the lights are on or off. But there are two parts of the body just here which are sensitive to light.

So light strikes the body—most of it, nothing happens. But these two bits, it hits something which receives it. There's a sensitivity there, a receptivity there. Bang! And something happens.

Similarly, there are two little parts of the body that are sensitive to sound waves. And there's a part of the body which is sensitive to taste. There's a part of the body which is sensitive to smells. All of the body is sensitive to touch. And then there's the other non-physical sensitivity, the mind, which has its own range of sensitivity.

So we have these six sensitivities. Each of them picks up its own unique kind of data. For example, my ears do not pick up my thoughts—they are totally insensitive to them. My mind is sensitive to my thoughts. So you have like six channels. Each channel sends in its particular data. The mind receives its own unique data, but unlike all of the others, it also picks up the other ones as well. And it's the mind, mano, mind as a sense sensitivity, which brings all this data together and creates a coherent, meaningful world.

So there you are in the meditation hall. Something is created. And the way each one of these senses work—the Buddha says, depending on eye sensitivity and forms, visual awareness arises. The meeting of the three is contact. This is what he says about the immediacy of the experience.

So you have the particular sensitivity, you have this particular corresponding kind of data, and you have the corresponding awareness. When these three meet, like in an arena, in one location, bang, something happens and you have an experience.

Does that make sense so far? With me?

Now you notice—this is the immediacy of experience. This is the first time something happens. You cannot get anything simpler than this. You cannot get anything more elemental than this. And you notice it's already a complex event. Three things need to come together.

If one of them is missing, nothing happens. When all three come together, something happens. Awareness is necessary for something to happen.

For example, let's say I'm reading something quite interesting in a café. My friend enters and sees me, calls out my name, but I don't hear it. He calls again—still nothing. He calls a third time, and I go, "Oh, what? Oh, there you are!"

Now, at what point did the touch begin? This word which gets translated as contact—*pasa*—could also be translated literally as touch, which I find quite interesting. We are touched by the sense data. At what point in that example does the touch on the ear sensitivity begin? It began sometime before I heard my name. The ear sensitivity was picking up data, but I didn't hear anything.

What changed such that I began to hear? Suddenly my attention, which was directing awareness, left the page—bang!—and went to the ear. "Oh, there you are." You need this convergence of three factors for an experience to take place. Experience at the most elemental level is already complex and requires the coming together of three different factors.

The meeting of the three is contact. Contact conditions feeling—*vedanā*. This sentence almost invariably follows the previous one. *Vedanā* is intimately and invariably associated with contact or touch.

This conditional relationship we explained this morning is immediate—there's no gap. It's not that there's contact and then the clock is ticking and somewhere down the track, ah, feeling arises. If there's contact, there is already feeling. There's no gap. And if there's contact, there has to be feeling. There's no exception to this, according to the Buddha.

If contact is the arena of experience, *vedanā* is found within the stimulus itself. Data strikes a sensitivity—there's some kind of bang, stimulus. Contact is like the arena within which this happens. *Vedanā* is like the stimulus itself.

Take the exercises we do in the morning. We're doing a stretch, for example. We come to a point where we get the message through the body and mind: "I can't go any further. This is it." The body feels it cannot move anymore—it's come to its limit. We experience a sense of hardness and pressure, perhaps, in both body and mind. We might also experience a touch of panic in the mind.

Then we stabilize ourselves, breathe and relax—this is the standard instruction. The body sensation changes and the mind changes. The mind softens, the body softens.

The meeting of sensation, sensitivity and awareness is contact. The different physical sensations are the elements. The responses indicate *vedanā*. The initial response of "that's it"—that's where we find the *vedanā*. The later response of settling into it—that's where we find the *vedanā*. It's in the response that we find the *vedanā*.

The relationship between sensation and *vedanā* is really intimate. You can't even say that we sense something and this sensation is accompanied by *vedanā*. If I say that, it implies that *vedanā* is separate from the sensation—here's the *vedanā*, there's the sensation.

And therefore it would be coherent to suggest that you could have a sensation without vedana. But from the Buddha's perspective, such a thing is completely incoherent. We sense, and vedana is already found in the response to the sensing. So they can be distinguished, but they can't be separated. Contact and feeling are as close as stimulus and response. Where there is a stimulus, there is already a response. And where there is a response, there is already a stimulus. They always come together as a package. They're different sides of the same coin. They're as intimate and inseparable as a sunflower turning toward the sun, or as a sleeper reaching for a pillow in the night.

We can get a sense of the depth of vedana when we look at the necessity of living beings to respond to what is necessary for their survival and what is necessary to avoid for their survival. Seeking the desired, avoiding the feared—these are fundamental to all living beings. And right in the middle of that is vedana.

So let's return to the way the Buddha and his students talk about vedana. We'll have a look at the Cula Vedalla Sutta, the lesser dialectic. This is a discussion between the arahant bhikkhuni Dhammadinna and her ex-husband Visakha. And this is what she says about vedana:

"Friend Visakha, whatever is sensed, bodily or mentally, as pleasant and soothing is pleasant feeling. Whatever is sensed, bodily or mentally, as painful and hurting is painful feeling. Whatever is sensed, bodily or mentally, as neither soothing nor hurting is neither painful nor pleasant feeling."

So that's Dhammadinna's presentation. And again, the verb that she uses is vedayati, from vedana. So it could be to feel, to experience, to sense something. So you could translate it as "whatever is felt is feeling," "whatever is experienced is experience," or "whatever is sensed is sensation."

When you get it down to that basic sentence that she's saying, these don't tell us very much. "Whatever is sensed is sensation" doesn't say very much. But what she says is "whatever is felt as pleasant and soothing is pleasant feeling. Whatever is felt as painful and hurting is painful feeling." In other words, vedana is a particular kind of experiencing characterized by the capacity to soothe or to hurt. That's what distinguishes it—the capacity to affect.

Perhaps she's not saying "whatever is felt is feeling," but "whatever is felt as pleasant, whatever is felt as painful is feeling." So it's feeling as, experiencing as, sensing as something. And that something is what distinguishes vedana.

So vedana represents some form of knowing. I sense this as something. I feel it as something. You can see there's some kind of understanding involved. But it's much more intimate than our normal sense of knowing something or understanding something. For example, I might say, "I know that"—I often do say that, actually, when I'm driving and the family's going somewhere. I turn to the right and my wife says, "It's to the left, again."

When we say "I know that," what we're suggesting is a distance between the one who knows and what is known. "I know that." So there's this separation, this subject-object distinction which is always implied in the notion of knowing something. Vedana implies a knowing that's much more intimate, less nameable, less amenable to being pinned down as a something that's known by someone. It's much more intimate than that.

But it's found in a response that goes in a particular direction. The response is in one direction, to hold on to. Or it's in another direction, to reject. Or it's in another direction, to ignore or to be in confusion about. So it's quite definite. Some kind of assessment is going on. "This is pleasant." Some kind of understanding, some kind of judgment has been made.

In that response, there's some kind of judgment that's been made, and it's quite definite. It takes the citta in a very specific direction. But if it's an assessment, it's a foundational, non-cognitive assessment that's built into the fabric of experience itself—before there is anyone who experiences.

I know that. There's someone here who knows that. But the knowing that's part of vedanā is so foundational and so much part of the fabric of experience that it happens—the judgment is made before there's anybody to make the judgment. The response is done before there's anyone to respond.

Does this make sense? No? We'll keep going.

"Would that suggest that every single person would have the same response to all stimuli regardless of their conditioning?"

No. There are bundles of infinite networks of conditioning. But there's no sense of identity in it. I mean, we bring into the world some tendencies. A baby will respond—different babies will respond to the same stimulus differently before they've created an identity. But the response is still there. The patterns are still there.

"Is there any sense of subconsciousness?"

Well, if you were going to talk about whether the Buddha had a concept of the unconscious mind, then I suspect this would be down there.

"When Dhammadinnā is describing this to her ex-husband, what does she say for neither?"

She just says it's neither soothing nor hurting.

"So she hasn't got confusion?"

No, but she's going to talk more about it in the next paragraph.

The comment about the idea that it's non-judgmental—like we have judgments, judgments are built in—makes one question the contemporary definition of living non-judgmentally. When those kinds of judgments are being made, we've already actually made a decision, and then we make a judgment. Which is what we're getting to next.

"Patrick, from what you're saying, vedanā is almost like another sense. It has pleasure, pain, success—rather like that. Like a seventh?"

Yeah, almost like a seventh sensitivity, except that it's attached to each of the sensitivities.

"Well, that's like the mind, in a sense, isn't it? It has access to all the data and has this sort of coordinating or integrating function. It's there in that also, isn't it?"

Yes, certainly it shares in that. It's certainly very close to that. Because the pleasure-pain comes from the whole integrated visual contact with that tree. And perhaps even before that, it might be rearranged and reshuffled within the mind.

But like one person might find one thing pleasant and another person might find it totally unpleasant. It's just our differences, our conditioning, whatever. And they might be conditioned to, over time, have a different judgment.

"They can change. I might not like ice cream today, but tomorrow I think ice cream's great."

This is part of dependent arising. It's always shifting.

But here what we're talking about is a kind of basic structure of the patterns, which remains true throughout. The structure does.

So vedana is a kind of assessment, a kind of response that is pre-intention. This brings us to *chaitanya*.

Chaitanya is a key technical term normally translated as intention. I like to translate it as choice or decision—the decision to act that arises from the perceived significance of an event. In other words, what will I do about it?

Chaitanya is extremely important in the Buddha's teaching because for him it's the central factor in how we construct our lives. He says very famously, "*Chaitanya* is karma." Everyone's heard about karma. Karma is absolutely central. And for the Buddha, *chaitanya* is karma. We could translate it as "choice is action." After choosing, one performs actions of body, speech, or mind. Or "decision is action." After decision, one performs action of body, speech, or mind. This is the whole realm of karma, which is the whole realm of ethics—totally centrally important to the Buddha.

Vedana represents the world as given to us before *chaitanya*, before a decision is made. It's in a sense the given background of the decisions that we make. Or you could say vedana presents the world that requires a decision. I've got to do something about this. Why do I have to do something about it? Because this world already has vedana built in, so it demands a decision. There's already a response, so I have to make a decision about it.

The fundamental decision that we have to make right now—literally right now—is how the experienced event is positioned in terms of me and my interests. Is it pleasant? Should I head towards it? Is it painful? Should I repel away from it? Is it neither, such that I won't bother to notice it at all? This is the whole world of vedana.

And it's very difficult to pin down in concept. It's like we start to talk about vedana and we hit the limits of language. This makes sense because if I am to speak of something, that something has to be an object out there, separate from the speaker. So, "I feel this to be..." To make such a statement, there has to be an "I" distant from the "this," which I feel to be whatever it is.

But when we're talking about the relationship between contact—the immediacy of experience—and vedana, the response to that immediacy, there's no distance from which any kind of description can be attempted. If there's no distance, if there's total intimacy, there's nothing you can say. Because to say anything requires separation.

So there's a response, but there's no rationalization of the response. This comes later. We're going to look at this discourse later on. In the *Madhupindika Sutta,* Mahakaccana says, "What we feel, we perceive. What we perceive, we think about. What we think about, we proliferate or we complicate." First he lays out contact, and then contact conditions feeling, and then he says, "What we feel, we perceive."

Perception is recognition. I recognize this place. This place is Blue Mountains Insight Meditation Centre. I recognize you lot. You're the latest group of meditators. Now this perception is fundamental. I don't have to think about it. I don't have to think, "Where is this?"

I know I've seen this place before. Ah! I remember. It's just obvious. It's just presented to me.

But perception is built upon feeling. I perceive what I've already felt. First comes the feeling. Then comes the perception. First comes the feeling... Then comes the world that I recognize, including me. But all of it rests upon feeling.

And then comes the thinking. Then I start to think about it and say, "Oh, this is good, this is bad. I like this, I don't like that. That's valuable, that's not valuable." But all of that is like up here—this complicated structure that's built. Down here at the base is vedanā, is feeling.

A student asks: "Say a black bird initially, and you didn't recognize what it was. Wouldn't it be maybe until after you decided it was a bird that you liked, or a crow that you don't like, that you would have a response after the perception?"

You might have an initial response, then there's perception, and that would feed back into the feeling, and the feeling might change.

"So you've got the category 'bird' anyway to start with?"

So you have the initial visual stimulus, and the Buddha is saying with that there's already a response. Then later on there's the perception: "Oh, that's a bird," and "Oh, that's this kind of bird."

So you just have initial response to the form of that, which probably would be nothing much. Because do we ever see it? Do we ever actually get down that far? But all along the way there's some kind of sense stimulus, and along with that is the feeling.

So the whole process is dynamic. It's changing every nanosecond. But the basic structure of it remains the same.

"Until you knew what sort of bird it was, couldn't it be both? Because it could be a bad bird, it could be a crow, so there's negative and positive."

Could be.

"Wouldn't vagueness stimulate the exploration of what kind of bird it is?"

That's another aspect. You see all the things you can start working with. I think it's so tied into the conditions. What past we bring with us is one thing.

So I think initially you would see—and I think it's you—you would see a black object, and there could be initial perception of blackness or darkness or something. But then perception would arise, and then in response to that perception there's another vedanā. And then in response to that there's thinking. In response to the thinking there's more vedanā. So it goes all along the line.

"Does this example show us that in fact, if it's neither pleasant nor unpleasant, we want it to be one or the other?"

If it's neither pleasant nor unpleasant, we probably wouldn't even notice it consciously. It probably wouldn't even rise up into consciousness. Or if it did rise up into consciousness, it would be, "What's that?" So we would be trying to check it out.

I think, as you suggest: Is this pleasant or painful? I think that's the crucial question for us. We do have a very... We want things to be pleasant or unpleasant. "Now, is this important to me or not? Should I run or not?"

The movement brings the contact because you may not have been paying attention before that. So contact happens, and at that point you have the interest to know whether this is going to be dangerous or pleasant.

And interest itself, depending on the person—some people find interest unpleasant. And some people find interest just in and of itself pleasant. Some people find just the fact of being able to see pleasant and will look at things just for the pleasure of looking, whether or not it doesn't matter what it is. Like in a retreat where you read the notice board again and again and again.

So vedanā creates the world that has the power to move us. It's found in the response to a stimulus. The Buddha points out there are three fundamental responses: If the vedanā of a sensation is pleasant, we are moved to grasp. If the vedanā of a sensation is painful, we are moved to reject or resist. And if the vedanā of a sensation is neither painful nor pleasant, we are moved to ignore it as beneath notice, or if we do notice it, we are moved to confusion and doubt about how to respond.

Damodaro goes on to say, "Pleasant feeling is pleasant when it persists and painful when it changes. Painful feeling is painful when it persists and pleasant when it changes. Neither painful nor pleasant feeling is pleasant when understood and painful when not understood."

That's interesting. So vedanā changes its nature. Like everything else, it's impermanent and shifting all the time. It changes its nature depending on how it moves and whether or not we understand it. I find that very interesting. And how can an object of experience be so protean that it shifts around like that? Well, maybe because it's not an object of experience. It's a relationship. And the relationship involves time and understanding.

So at first, vedanā appears solid. It appears to be something which is either pleasant or painful. But its solidity dissolves over time, because that which is pleasant is so only as long as it persists, and it becomes painful when it changes. So when its solidity is perceived to be illusory, then suddenly it shifts into being painful. And the converse is true of that which is painful—it's painful only as long as it appears to be solid. But once that solidity is seen to be illusory, it ceases to be painful. So it depends upon time. Again, it's more a felt relationship than a thing. And it's a relationship which is continually flowing.

In terms of the third one, that which is neither painful nor pleasant, that changes into either pleasant or painful, depending on shifts in understanding. So our capacity to discern vedanā changes vedanā.

Now the word translated here as understanding is ñāṇa, which is the same word you find in vipassanā ñāṇa, insight knowledge. But here it's got a more general meaning. Here the fluidity of vedanā is not a function of time, but of a relationship involving

awareness and understanding. So what this suggests is that something is here, but not known. And then later, it's known. It's understood. So what is presently experienced changes as it moves in and out of awareness.

When outside awareness, it's painful. And this is really odd, isn't it? How can you have painful without awareness? How can something be felt as painful when it's beyond the boundaries of awareness?

Perhaps what Dhammadinna is getting at is sometimes there's a felt sense of obscurity and its accompanying confusion. For example, in disturbed sleep. Have you ever had disturbed sleep? Is it pleasant or painful? Unpleasant. And yet it's characterized by not knowing. But there is something—there's an obscurity to it. And I think what Dhammadinna is suggesting is that very obscurity is painful. Or restless distraction. So something is felt as being here but only obscurely. And it's felt as painful. But when it emerges and we confront it directly, then it's not so bad. It could even be pleasant. I think this is what she's getting at, this kind of relationship.

So given all of the above, how do we practice vedanā, the vedanānupassanā satipaṭṭhāna? The practice is vedanānupassanā. Anupassanā is contemplating or tracking, tracking vedanā. How do we do that?

This practice, first of all, takes us directly into the realm of affect. What does this feel like? It's perhaps a key question. What does it mean to like something?

To dislike something? What does that mean? What is that experience? What's the nature of it? What is pleasure? What is pain? What's confusion? What is it exactly?

In this practice, what we're doing is training ourselves to investigate our experience. This is the basic move. And of course this quality of investigation has a strong cognitive element to it, and generally it appeals to people who are a bit on the cognitive side.

Vedana points us towards our own subjectivity. Can we investigate our own subjectivity? Or another way of looking at it is: can I objectify my own subjectivity? And again, it's tricky to talk about because as soon as we start to speak about it, we're drawn into the realm of cognition and away from feeling, away from affect. But let's try to say what we can.

Firstly, working with vedana entails cultivating intimacy. The direction is always in. More and more in. More and more intimate with the experience.

Secondly, if we're working with vedana, normally what we would work with are the first two aspects: pleasant and painful, attraction and aversion, because these are the most obvious. The third one is harder to work with because it's so much more obscure.

One way of working with it is with what we call emotion. They're obviously either pleasant or painful, but let's avoid the obvious. Let's say we might work with what we normally call mood. There's always some kind of underlying mood. This experience now is flavoured in some way, and I'm already moved by this flavour. I already find this situation as in some way satisfactory or unsatisfactory.

What's the quality of this pleasure or pain? What is that? How do I feel that? What does it feel like?

Let's take pain. Pain may be so subtle that I can overlook it. I gave the example this morning—being very aversive, I tend to work with pain. Let's take, for example: has anybody had the experience of having a good sit? Now, forget about the bad ones. I'm just talking about the good ones. You're in a situation where you've got the meditation periods and someone rings the bell at the end, and you're having a good sit—which means pleasant—and the bell goes, and you notice that very subtle response immediately arises: "Phew!" Does that ever happen? Is it just me?

Now where does this "phew" come from? There's something about that experience which has to be painful, because otherwise I wouldn't have responded that way. What is that? I didn't notice it at first. If someone had interrupted me to conduct research, I would have said, "Oh, very pleasant." But apparently not. The pain might be so subtle that it can be easily overlooked.

The other thing that must not be overlooked is pleasure. This is, I think, very important for meditators. As the mind settles, we find a pleasure in mindfulness and awareness—a pleasure which is completely different from our normal pleasure of getting what I want or receiving some kind of interesting stimulus. We've talked about the freshness of things that we can experience, the directness of the felt encounter with the world that arises when we're doing this practice. And there is a pleasure in that.

Can I drop into the citta and feel that pleasure?

And finally, vedana always concerns a response, so we can find it in our responses. The example I gave just then, "phew"—that's a response. And that's where we find vedana. So I am moved to hold or to reject or to ignore. Can I see this movement? Can I discern this movement in real time? Can I feel it? Can I discover what's feeding it? What's behind it? That's interesting.

So this is an exposition on vedana. It's very complicated when you try to talk about it, but in terms of experience it's incredibly simple. It's complicated to talk about because it resists any kind of conceptualization. The concept takes us away from vedana. Vedana is still there. Vedana is always here. There is not a nanosecond of our lives in which we are not being moved by vedana. We're always moved by vedana. But it's harder to pick up when we're lost in the cognitive, when we're lost in concept. So the more we conceptualize it, the more difficult it is to get hold of it.

And we talked about it being difficult to get hold of it because it's already got hold of us. Again, the intimacy of it makes it tricky. But it's radically simple, and it's basically a matter of dropping into it. And it's important to drop into it because it's the source of every decision that we make and every perception that we have about ourselves and our world. So opening up to this realm is an important aspect of the meditation practice. And it's not something that can be pinned down by a technique, but it is something to have the radar open to, to be sensitive toward, to be ready to pick it up when it comes knocking.

Okay, that's enough for tonight. Any questions or comments?

"The simultaneous—" Yes, that's one possibility. And it's a possibility that the pleasant is immediately replaced by the painful so that it was pleasant up until you heard the bell. That's a possibility. There's infinite possibilities. Can we start to become sensitive to it, to that whole realm?

"When you said one of the things you can do is work with the attraction or the aversion—what do you mean by that? Just really experience the attraction or the aversion?"

You can experience it as, for example, attraction literally as a movement. It's like I feel myself—I can, like in the mind, the attraction of thought, distracting thought, I can feel the awareness go into it. It's an interesting feeling. Or with something that I recoil against, I can feel that the mind goes—there's a raw energy to it. So it's really building up a sensibility towards that. It's all about sensitivity. It's cultivating a particular sensitivity. It's like, I know there's something of this nature here. Can I learn to tune into it? Can I become sensitive to it?

"You just gave examples that sometimes with thoughts you can feel yourself being attracted to them or repulsed by them, but earlier—and I completely understand that—the thing that I don't understand is earlier you were saying that the cognitive area gets you away from... I don't know, but there's so much vedana in ideas, like people who go 'Oh, I get it!' or 'Aha!' or recognition, or like this morning when your clock—when you

finished the talk, you said, 'Oh, just in time, the battery was about to run out.' And there was sort of like vedana in that. That was just recognition of a coincidence. So I just don't quite get that vedana is absent in the cognition—sorry, removes us away from it."

When we—the more we think about it, the more we tend to miss it. So if we think too much, we can tend to miss the feeling aspect. But the feeling aspect is always there. And as you point out, in the realm of cognition, there's also affect. And some people are particularly sensitive to that. Some people find a great deal of feeling in thoughts. For example, I would say academics and people generally who are attached to view, like me, find a great deal of affect in concepts. In scientists and inventors.

Because it's a sense base. And every sense base has its vedana with it. So the cognitive realm—the thoughts are the object. So you've got the sensitivity, the object, and consciousness is contact and vedana in all of life. So if the mind is the sensitivity and the thought is the object, when you're aware of the thought, it's vedana in all of life.

So when a pleasant thought arises you get a pleasant feeling. When an unpleasant thought arises you get an unpleasant feeling.

It's no different in that way to any other sense sphere. But what I was getting at is that we can get too caught up bringing the head in. This practice is about opening up the heart in a broad sense. It's about the heart rather than the head when we first approach it.

Can understanding or insight be grasped conceptually? Certainly it cannot be understood in that way. It defies intellectual understanding because it's too elemental.

Take me as an example of a dried up old stick—because my background, my habit, is always to approach head first rather than heart first. I've had to recondition myself to work more in what we would call the heart area, because I was so caught up in the realm of cognition that I was cutting myself off from much of the realm of feeling. Of course, that cognitive realm is a pleasant realm, and I can get lost there. I can have a great time there.

But recognizing this background mood, this bias that you have—the karmic bias, whatever you want to call it—and then moving in another direction through cetana... hence cetana is so important because that's what we can work on. That's the steering wheel. Until you understand that background bias, you're really just being a puppet on a string.

You could say cetana is like the court of appeal—you can now review and maybe go in a different direction. By the time we're thinking about something, we've already made a decision. But that decision is always subject to review. There's a power of veto. So we have free will, not free won't.

Part of this whole process of insight meditation is to expose what was previously unconscious and bring it up into consciousness. And then something can happen, something can change. When people work with emotions in this practice, it's exactly this process. Normally I react when someone does X, but if I can actually see in real time the arising of that pattern, then it gives me the opportunity to say, "Uh-uh, no, I think I'll try something else."

All along the way, the background and the ocean within which we're swimming is an ocean of vedana. It's like being an amoeba—we're all Buddha's little amoebas. Amoebas don't have so much cetana, and they don't have so much dukkha. But they definitely have vedana in them—the movement toward and away from.

The cetana is the choice—the choice either to lead into more suffering or to lead out of it. The volitional choice, made on top of the deeper layer of non-volitional choices that have already been made.

CHAPTER 8

Tracking Vedanā

Patrick Kearney · 1h05

> *In this dharma talk from a month-long retreat, Patrick Kearney guides practitioners through an experiential exploration of vedanā, the second of the four satipaṭṭhānas. Beginning with a meditation experiment comparing 'watching' versus 'feeling' the breath, he demonstrates how different modes of awareness reveal the intimate nature of vedanā as the 'flavor' of experience that drives all our responses.*
>
> *Drawing from the Satipaṭṭhāna Sutta (MN 10), Kearney explains the Buddha's classification of vedanā into three categories: pleasant, painful, and neither painful nor pleasant (not 'neutral' as commonly mistranslated). He emphasizes that vedanā operates in the realm of affect rather than cognition - the heart rather than the head - and is what moves us to respond to every moment of experience. The talk includes personal anecdotes about discovering vedanā through practice, its relationship to contact and craving in dependent origination, and practical guidance for working with this fundamental aspect of experience.*
>
> *This teaching offers both newcomers and experienced practitioners insights into one of Buddhism's most subtle yet pervasive teachings, emphasizing experiential understanding over conceptual analysis and encouraging a playful, experimental approach to meditation practice.*

Over the past few days in our practice we've been emphasizing the role of the body. The body is the first of the four satipaṭṭhānas, so we've been working on that first. Today we're going to play around with the second satipaṭṭhāna, vedanā, usually translated as feeling. We're going to start with a meditation experiment and then we'll talk about it afterwards.

Again, with these little experiments don't take them seriously. Treat them as games and play and see what happens.

So if you establish your posture, set up your meditation posture, and open your awareness up to the whole body, experiencing the whole body. Now focus on the movements within the body that indicate breathing. Watch your breathing. Look at your breathing. Witness your breathing.

And now, feel your breathing. Don't watch it. Don't look at it. Don't witness it. Feel it. Feel your breathing.

Is there a difference between watching the breathing and feeling the breathing? And if so, what is it?

Yes, there is a difference. What's the difference?

"When you're feeling it, you're a lot closer. When you're watching it's more like a top-down kind of approach to it."

Disembodied and top-down. Where do you watch it from?

"Some kind of conceptualisation in the brain, I guess."

Don't theorise, just tell me where you watch it from.

"Yeah, it's looking down."

Anybody else? Anybody else find it different?

"I think I changed senses when I was witnessing, watching it. There was a bit of touch in it, but it was mostly kind of internal seeing. While when I felt it, I moved back more to touch, internal touch, the nose and the air passage and the lifting of the lungs and how it felt at the top of the lungs. It was much more touch-based than watching."

"I actually seemed to be feeling it when I was meant to be watching it and feeling it when I was feeling it. It wasn't that much difference to me. There wasn't any difference because you feel it anyway. I mean somebody might say watch the breath but basically that goes and you just feel the breath."

"A little bit like the other two speakers. When I was mentally observing I did feel apart from it and I could sort of just feel a part of it so that felt really good. And then with feelings, I mean the words, it just felt timeless, which is not a feeling-type word but for me that was how it felt. It sort of felt timeless."

Timeless?

"Yeah, that was the word that came through. Felt with feeling, both closer as the other person said, but also more identified with the breath in some way. Whereas the watching, there's further away, more of a subject-object. More detachment perhaps?"

"Yes, though I must say I thought the main difference in the instructions was in the attunement. When you said watch the breath, look at the breath, it was kind of an admonition. And then you said, feel the breath. You were conveying a feeling."

"I remember a locus of observation tends to be in the middle of the body but at the back, as if my eyes are kind of here in the felt sense. And when you said watch the breath, I still had the experience of touch, but when I moved from watching the breath, the touch of the breath, to feel the breath, I was kind of more actively noticing which bits were painful and unpleasant and which bits were neutral, and what part of the breath, what parts of the body were actually not hurting. Because it's kind of painful at the moment, but it's not all painful. So I was really teasing out the pleasant-unpleasant quality rather than just the felt touch. So it brought out the whole pleasant-unpleasant-ness, the kind of mosaic of pleasant-unpleasant and where they are."

Thank you.

"When you said, watch your breath, I was sort of feeling that I wasn't really aware of the feeling tones. I was struggling a little bit, a little bit of strain. When you said feel it, definitely I came more into my body. And definitely I became more aware of that quality of it."

The painful, pleasant, painful quality of it, yeah.

Kim?

"Watching the breath, I was aware of the movement, but feeling it, I was aware of texture."

So texture when you're feeling, you found texture; when you're watching, you found movement. I like this experiment. Part of it is the power of suggestion, the power of language.

When I started doing meditation, all the language around it was about watching—watching and witnessing. So my initial instructions, as far back as I can remember, were all about watching the meditation object, which is what I did. Eventually I noticed that I would be aware of my—let's say, rising and falling of the abdomen—from up here.

Anybody ever get eye strain when they meditate? It can happen. Because there's this association of watching: where do I watch from? Well, I watch here. So I'm looking down at the breathing.

But years ago, my last trip to Burma, I attended an Abhidharma course in—where was it? Across the river from Mandalay. I forget the name of it.

"Sagaing."

And we had Abhidharma in the morning and meditation at other times. It was a combination of Abhidharma course and retreat. One day the teacher was talking about vedana. And do you know how if someone's explaining something to you that you already know, you tend to go half asleep? You just keep the radar open enough to kind of have a sense of where they are, but you're not really paying attention because you already know.

I was doing this, and at one point I suddenly realized that he just said something about vedana and I didn't understand what he just said. And this frisson of alarm went through me, and I realized: if I don't understand that, that means I actually don't understand vedana. And I thought I did.

So then I started to pay attention. And I got quite intrigued by this. I went back, deciding, "OK, I don't know what vedana is. So I have to find out." And so what I did was, when I started the meditation part of the day, I decided: from now on, I'm not going to watch anything at all. I'm going to feel the meditation object. And then I'll find out.

I noticed the experience was different. So I got very intrigued by all this. I started doing this experiment, and I've been doing this for years with people. If you've done retreats with me before, you've done this.

Some typical responses that people give: for some people, watching indicates distance, feeling indicates closer perspective. A number of people have commented about this. For some people, watching is detailed and specific, whereas feeling is much more general—although we've had a couple of people for whom it's the opposite. The feeling is actually more specific. You heard about the specificity of pleasant, painful, while the watching is more general.

For some people, when they watch the breathing, they naturally go here at the nostril. And when they feel the breathing, it's down here, somewhere within the body. See, you do get a whole range of responses.

One response that people come up with is, "What the hell are you talking about?" Just completely bamboozled. Some people will say there is no difference because "I always feel the meditation object. Why would I watch it? Are you crazy?" So there's no difference.

You do get this wide variety of responses, but it's interesting that what it brings out is that there are different ways to be aware. There are different ways to relate to an object of awareness.

Now, you notice that we've made no attempt to define vedana or feeling. In fact, I've just assumed you know what it is. But there's no reason why we should make this assumption. Let's go back to the Buddha and what he...

...what he's talking about. When he talks about what he calls vedana, he discusses it in terms of the qualities of pleasant, painful and neither.

In the Satipatthana Sutta, he says, "How does a practitioner live tracking feeling as feeling? Here, a practitioner sensing a pleasant feeling understands he's sensing a pleasant feeling. Sensing a painful feeling, he understands he is sensing a painful feeling. Sensing a neither painful nor pleasant feeling, he understands he is sensing a neither painful nor pleasant feeling."

So feeling gets divided up into three categories: pleasant, painful, neither.

One of my favorite hobby horses is to get up and shake my fist and denounce those who claim that the third feeling is neutral. Buddha does not say neutral. If he wanted to say neutral, he would have said neutral. He does not say neutral. He says, "neither painful nor pleasant." Understand?

You get the three feelings—pleasant, painful, neither—based on which you get three elemental responses. If there's pleasant feeling, there's grasping, attachment. If there's painful feeling, there's aversion, rejection. If there's neither painful nor pleasant, there's delusion and ignorance.

In other words, neither painful nor pleasant means "don't know." It's the feeling of the teenage boy. "How was your day?" "Dunno." "Would you like this?" "Dunno." This is what the Buddha's getting at. It's the not knowing. And so it's associated with delusion and ignorance. It's not neutrality. Neutrality is something else.

"So you don't feel neutrality?" You do, but neutrality is... These three categories are the kind of ground level, universal. Neutrality is a subtler feeling, but when it's developed in the practice, it becomes equanimity. And the response is equanimity. The response to genuine neutral feeling is equanimity.

The first time I became aware of this was—I've often told this story, it's a bit embarrassing—I was doing a retreat with John Hale. After about ten days or so, I hit a wall. I just couldn't do this anymore, completely stuck. This was down at Udumbara, at what is now the nunnery.

I went to John and said, "I'm stuck, I've hit the wall, what can I do?" He looked at me rather fiercely and said, "Come with me." We left the main building and walked off to the hut that I was staying in. Now this was quite remarkable because at the time John was dying and movement was difficult for him. So to take me on a walk, to give me a talk, I knew something was going on.

We went off to this little private area and sat down. He considered the situation and said, "Patrick, you are a dried up old stick." Oh my God. "You are a dried up old stick. You are completely cut off from your feelings. You've got no idea what you're feeling, do you? You are totally oblivious to what you are feeling." And he put the boot in and I was, "Oh, yes, okay."

I said, "Well, what can I do about it?" He thought about this and said, "It's probably too late now." So I knew he was serious.

So then he put me onto vedana as a meditation object. I started to play with vedana, and it was a complete revelation. It was like, "Wha!" I discovered that I was living in this waterfall of vedana. It was everywhere—cascading through seeing, hearing, smelling, tasting, touching, minding. It was everywhere.

I was certainly no longer stuck. The wall had vanished, and I was playing around. But after about two or three days, again I got stuck. This time it was quite weird because I just couldn't find it—I could not find the vedana. It was really strange because I checked everything. The mind was really clear and sharp, the concentration was good, everything was going smoothly, but I could not find the vedana.

So I went to John and reported this, and he said, "Neutral feeling is the hardest to discern." I realized that's what it was—neutrality. It is so subtle that it's actually difficult to even recognize. It's not pleasant, but it's more pleasant than pleasant pleasure. It's better than pleasant feeling. But he meant neutrality—the actual neutrality that's associated with equanimity. He wasn't talking about ground-level feeling. He was talking about a feeling which is accessible once you develop a certain degree of mindfulness and concentration. Then that "neither painful nor pleasant" feeling has morphed into neutral feeling.

Does that lead to equanimity? Yes, the natural response to that is equanimity. In this case, for example, I was feeling frustrated because I couldn't find it. Therefore, conceptually, the whole project had failed, yet I was feeling very good. I wasn't upset by it. It was just, "Oh yes, I can't find it. Yes, there's a problem." But actually the equanimity was just there all the time.

The response to pleasantness is some degree of grasping, except when it matures and then the response is saddha, faith. The response to aversion is rejection, except when it matures and then the response is wisdom. And equanimity when it matures.

So when the Buddha's talking about these three basic categories of feeling—and they are categories of feeling, a system of classification—then at the ground level we have pleasant, painful, neither. In other words, essentially pleasant or painful. Either I like this or I don't like it. And in either case, I'll pay attention to it. It's important. "I like this. Ooh, pay attention. Ooh, I really dislike this. Okay, pay attention."

If it's neither, I just don't notice it. Why would I bother? So I don't pay any attention to it, so I don't even see it. So I'm ignorant. That is, literally, it just doesn't register. Or if it does register, I don't know what I should do about it. Should I grab it? Should I reject it?

Should I grab it? Should I reject it? I don't know. So there's doubt and confusion.

The first two vedanās are really quite clear and obvious—it's a simple binary of like and don't like, grab and reject. The third one is more complex. It can manifest in two forms. One is that I simply remain oblivious to it. Or if I do notice it, I'm doubtful and confused about what to do about it. Should I grab? Should I reject? Grab, reject, grab, reject. Ever had any kind of restless sleep? It's like that. You don't quite know what's going on, but there's a kind of agitation about it. It's murky. If you speak to people with a lot of delusion, they often say it's like that—a kind of murkiness and restlessness, dullness.

So these are the three categories of vedanā.

Now vedanā is all about the realm of affect. It's the feeling, the affective world, as distinct from the cognitive world. It's what we would call heart rather than head. The Buddha talks about wisdom—that's head. He talks about the opposite of wisdom as ignorance—again, head. But the Buddha will also talk about, for example, saddhā, inadequately translated as faith. That's heart. And he will talk about the problem as taṇhā, craving, drivenness. Again, that's heart. Vedanā represents this whole area of heart, of affect.

Let me look at these terms more closely. Saddhā and taṇhā are both terms that refer to the world of affect. In saddhā, the *dhā* is the root meaning "to put" or "to place." *Śrad* in Sanskrit is an old word for heart. So saddhā is to place the heart or to place in the heart. In English we have the expression "I put my heart into it"—that's an emotional connection. So saddhā is the heart connection to what's going on.

What about taṇhā? It's not *dhā*, it's *ṇhā*—not D-H-A, but T-A-N-H-A, *tṛṣṇā* in Sanskrit. That's literally thirst. If you think about thirst: I might think that I'm thirsty—well, that means I'm not really thirsty. If I'm really thirsty, I'm just thirsty. It's feeling, it's the heart area. And there's a drivenness, a desperation about it. I've got to do something about it. I don't think that I have to do something about it—I have to do something about it.

So this is the area of affect. When you look at the Buddha's language, some of the terms he uses refer to this world of affect, of feeling, of what we would call emotion. And some of his terms refer to the world of cognition. They're both parts of the human being. We're part cognition and part feeling.

And Vedana is over here. Vedana refers to this whole area. We're going to talk more about it tonight. Vedana is, I found, one of the most difficult subjects to actually get across. It seems to be quite simple and obvious, but when you start to actually talk about it, it's quite difficult.

Vedana is rather like the flavor of the experience. Every experience comes to us flavored in some way. It's like the flavor of food. When I eat, there's a whole variety of physical sensations—hard, soft, smooth, crunchy, hot, cold, and so forth. These are physical sensations. Food also has flavors. The flavor is not the sensation, the physical sensation, but it's intimately tied up with the sensation. You can't have the flavor without the sensation. When I'm moved to respond, to get up and take seconds or to push the plate away and not have it at all, what moves me, what creates that response, is the flavor.

Vedana is the flavor of the experience, whether the experience be physical or non-physical. So Vedana is what moves us. It's what provokes a response. Something happens, I respond. Vedana is what provokes that response. It's the felt sense of experience—the feltness of the sense. There's the data of the physical body, like hot, cold, hard, soft, and then the mind's response to that data. The Vedana is in the response. You could even say the Vedana is the response.

Is it the mind or the heart? The mind's response or the heart's response? It's the citta's response, which covers both, but here the context would be heart, because it's the feeling area. So probably it would be better to say heart's response. We have the expression "a heartfelt response," conveying the same sort of thing but at a very strong level. But it's automatic.

This is an interesting debate. Sometimes people do translate it as sensation. But the problem with that is if we translate it as sensation, we have no word for the actual data as distinct from the response to the data. But often you do see Vedana translated as sen-

sation because Vedana and sensation are so intimately intertwined that for practical purposes you can't separate them, because they're so close. We're going to talk about this tonight. It gets really tricky to talk about. This is why it's so hard to actually grasp it.

In English, feeling means both sensation and emotion. The word is ambiguous in both Pali and in English. For example, in English and in Pali, a feeling can be a thing—"you hurt my feelings," so feelings are a something. I can experience my feelings; you are cut off from your feelings. So there are your feelings, and your job is to experience them—they are the object of your experience. But you can also say, "Yes, I understand that's a good idea, but I can't help but feel it's not right."

There you're not talking about a something that you experience but a way of experiencing. If you want to do this, you've just got to feel your way into it. What are you conveying there? You're saying there's a particular way you need to experience this, and maybe it's not the way that you're used to. In Pali, as in English, Vedana can refer both to what one experiences—so you can make Vedana the object of your awareness—

But it also refers to a way of experiencing. So you can feel the meditation object, or you can watch the meditation object. And that, of course, was what we were doing for this little exercise.

"I find it really hard to separate a feeling from watching it. Because the feeling is there, and then in order to actually have the feeling, there must be something that's watching it. There must be awareness of it. If there was nothing there watching it, the feeling would be..."

"So there's the feeling and the awareness of the feeling. That's the watcher, isn't it?"

"Yeah, you could say watching. But certainly awareness. And the thing about—well, we'll talk more about this tonight—the Buddha says contact conditions feeling. Contact is the immediacy of experience. Where there is contact, there is feeling."

Now this relationship, this causal conditional relationship, is extremely tight. The Buddha is not suggesting that first you have an experience and then later on feeling joins the party. He says if you're experiencing now, you are feeling now. And also this relationship is compulsory. It is impossible to have an experience without feeling.

He then says feeling conditions craving. Now that relationship is not compulsory. You can have feeling without craving. But you cannot have experience without feeling. So it's bound up really tightly. And one of the implications of this is it's very difficult to actually tease them apart. So it's not actually worth worrying about for practical purposes. It comes together, doesn't it?

Different people are sensitive to different aspects of experience. Some people naturally are attuned to the feeling aspect. Some people naturally are attuned to the awareness aspect and not the feeling aspect. And some people are naturally attuned to both.

Such a person is likely to say, "What the hell are you talking about?" Precisely because they've already got it. It's like you're trying to explain something new to me and the more you explain it the more confused I get because I already know it. So sometimes that's the response that you get when you talk about this. It's difficult to talk about because it's so intimate.

Last night we were talking about the Buddha's use of the verb *patisamvediti*, which I translated as sensing. But you could translate it as feeling. Now I translated it as sensing because I was looking for an English word that conveys intimacy. What's the closest, most intimate form of experience that you can talk about using the English language? What's the verb you would use? If you wanted to express an experience which was completely close, completely intimate, what verb would you use?

"Engage." "Experiencing." "Engaging." "Feeling." "Sensation." "Sensing." "Moving." "I was moved. I moved."

But here it's like, let's say with the breath...

The breath moving. That doesn't quite work. Inhabiting the breath? But you notice how we're groping for the right expression? There's no obvious candidate that stands out. So I chose "sensing." But these verbs like *paṭisaṃvedeti* and similar terms—this is what I think the Buddha is expressing in Pali. He's pointing to a form of experiencing that is really, really intimate. And this is the realm of vedanā.

This understanding is important for practical purposes because it's all about response. I respond to the world. But why do I respond in that particular way? You can see gross levels of response: "Jesus, I hate that. I just get so pissed off when people do this or that." And the flip side: "I just love that. I've got to have it. I just can't let that go. If I don't get this, I'm going to kill myself."

All the way down to the subtlest levels—you can be sitting in meditation with just this vague sense of disquiet. It's so subtle you don't even notice it until the bell rings to indicate the end of the sitting, and there's this instant response: "Phew." That's the first hint you get that actually, over the past half hour, there's been this sense of disquiet. It's so subtle. All of this is vedanā.

So to get to know vedanā is to get to know our responses. Why is it that awareness, that the mind, moves toward this? Why does it do that? Vedanā—it's moved to go there. That movement is vedanā. To get to know vedanā, to become familiar with it, opens up this whole realm of how the citta, the heart-mind, responds to everything. How it is responding now. Right now there is vedanā. Right now I am already responding.

As a meditator, I've got to be interested in this. But the strange thing about it is there's no technique for it. It's too intimate. You either feel it or you don't feel it. It's so fast.

It's both very fast and inescapable, because it's happening now. And there's never a moment in my life when it's not happening now.

"Isn't vedanā also simultaneous with the consciousness of it? So it's the contact, the feeling, and consciousness all happening..."

All in one package. Boom. Exactly.

And because of its complexity, different minds have different sensitivities. The same mind has different sensitivities over time, so that at one point I may be more attuned to the awareness aspect. At another time I may be more attuned to the feeling aspect. At another time I may be more attuned to the impact of the contact.

"It's like love."

Mmm-hmm.

"It defies analysis. It defies conceptualization."

And it drives conceptualization. Why am I trying to make sense of it?

I am moved in that direction. It's the vedanā which is pushing me to try to make sense of it.

I was very struck by the idea that every single cell in our body, or a one-celled animal, an amoeba, the one thing it can do without a brain is approach or avoid. So if that's true of every cell in our body, it's more fundamental than breathing.

Yes, it is. The Buddha would agree with that. It is more fundamental than breathing. Feeling is more fundamental than breathing.

In our culture we exalt reason and rationality. All of that rests on the foundation of vedanā and is an expression of vedanā. Even plants can do it. Amoebas do it. Plants do it.

In terms of the meditation practice, working with vedanā is basically impossible to pin down as a technique, but it's all about intimacy and it's all about the relationship to the present, because it is happening. It's not that it's going to happen later. It is happening. It's immediately available. It's always immediately available. And it's what's driving everything.

So the more I uncover it, the more I can see: What is it that I do? What are the responses? How am I responding to this situation? And what's driving that response? All of this is revealed through vedanā.

But we'll talk more about it tonight. We're going to have a dharma talk on vedanā.

If it's not useful, forget about it. Anything that I say that is not useful, just don't even bother arguing with it—just let it go. But feel your way through the day, and if you do that, be really genuinely experimental. There's nothing that is supposed to happen. Just play with it and see what does happen. The important thing is to learn from the experience.

And you learn by playing. It's the basic principle that if you've got some complicated piece of electronics in the household and you don't know how to use it, who do you call upon? The youngest member of the household. Now, why is this? Is this because that said youngest member was born with a PhD in electronics, which they inherited from a previous life? No. It's because when you get your complicated piece of electronics, the child looks at it and thinks he's looking at a toy. And so he plays with it. And because he plays with it, he learns it.

Meditation is a toy. Please play.

When I was last in Burma, one of the things that I did was go to bookshops and collect books written in English about Buddhism, because I was interested in what do Burmese people read about Buddhism. I can't read Burmese, so I was looking at English books.

In Burma there's dozens of different meditation methods, particularly insight meditation methods. Only two of them have been exported, but there's heaps of them in Burma. And there's one insight meditation technique which is very popular in the Mandalay area. Mandalay and Sagina are intellectual centres for Burmese Buddhism. There's a hell of a lot of study that goes on there, and particularly Abhidhamma.

There's a particular form of insight meditation which is popular in that part of the country, which is very Abhidhamma-based. Like many of the methods, its grounding object is kāyika vedanā—vedanā felt in the body. Think Goenka method. Vedanā in the body, because it's obvious.

I found a beginner's instruction manual for doing this, and the author had various warnings for the beginning meditator. One of the warnings was: if you're going to practice using vedanā, in particular bodily vedanā, as your meditation object, do not make the very common mistake of looking for it.

Because if you look for vedanā, it's rather like looking for your glasses. Now I know that I can distinctly remember putting my glasses on when I was in my room and coming down here, and I could actually see at a distance. So I know I had them on. I came in here...

Obviously I took them off at some point and they're gone. And I've looked everywhere. The only rational conclusion is one of you bastards took them. So I'm just telling you, none of you are getting out of here until I get my glasses back. Is that clear?

It's like that. For a start, if I'm looking for something, it assumes it's somehow hidden. You cannot hide Vedana. It's bleeding obvious. If you look for it, you're thinking, ah, it's something special. And if I'm just clever enough, I'll stumble upon it. The very desire to stumble upon it is an expression of Vedana. It's too obvious, isn't it?

It's hidden in plain sight. Yes, it's hidden in plain sight. It's so obvious that it's difficult to recognize.

Patrick asked about the practice of noticing pleasant, unpleasant. Yeah, that's where it's most obvious. They're the two which are clear. If you go into work with Vedana, they're the two that you would actually go for. So you notice any recognition of the pleasant or any recognition of the painful.

For example, in the visual field, the eyes are constantly scanning the visual scene. I noticed with my eyes, when I sit here and they're kind of scanning, that there were certain parts of the room—dark corners—that the eyes would just skip over a bit faster. When the eyes kind of go outside to the view, they'll just linger there, just for a moment. Painful, pleasant.

You can see this with all the senses. Where do the senses go? How long do they linger? You can start to say, oh, pleasant, painful, pleasant, pleasant, painful, pleasant, pleasant, pain, pain, pleasant, pain, good, bad, good, bad. It comes with the territory.

Also, one warning I should address. You notice the contradiction that what we're talking about this morning is feeling, and yet it's being incredibly intellectual. There's concept and there's experience. When you're working with the meditation tradition, you're always dealing with concept and experience.

I think, first of all, the technical terms that the Buddha uses are very precise, but they're not scientific terms. They're more like poetry. So if you read poetry—good poetry—you can get a very precise meaning that's coming out of those words. And yet, if somebody else is reading the poem and they have a very different meaning, you wouldn't be inclined to have the same kind of argument with them if you were both reading a science textbook and coming up with different meanings. Because you know that poetry has an element of subjectivity, and you can quite legitimately read the same poem in different ways.

For me, the Buddha's teaching is a form of poetry. It's the poetry of human experience. Yes, it's incredibly precise, but it's fundamentally poetry. Sometimes when you pin down a meaning you've got a meaning that works for you, but it's not necessarily—you know—absolutely this is what the Buddha means and anybody who disagrees is wrong.

So don't get caught up in concepts. It's not that there's an objectively correct meaning for terms like Vedana and therefore an objectively correct experience that we're supposed to find, or an objectively correct method of practice. It's more like these concepts can guide us in cultivating a particular form of sensitivity to what is already happening.

If you're trying to track Vedana, start with the experience and then interpret it. Don't start with the interpretation and from there look for the corresponding experience. You start with the experience. I'm already feeling this. And from there I get the concept, the interpretation.

Is this what they mean by Vedana? Don't start with the concept—"Where is Vedana?"—and then from there look for the experience. "Could this be it? Is this it? Maybe this is it." Favor the experience over the concept. Clarify the experience. Basically, become intimate. And then you might question, "Is this what they mean by Vedana?" And if it fits, it fits—for you. And if it doesn't fit, it doesn't fit.

Questioning whether something is pleasant or unpleasant—is that what you mean? I think that's quite useful. We're going to talk about what exactly that means tonight when we look at Dhammadina's explanation of it.

For example, you can also look at attachment and aversion, because attachment and aversion are responses to pleasant and painful. One way that I've worked with it—I have heaps of aversion. I'm very strongly aversive. I'd like to sum it up by saying that for me, approximately 95% of my experience, I'd much rather it was something else.

"You'd much rather it was something else? 95%?" At a conservative estimate.

"I don't remember that in the interview today."

This is the nature of aversion.

"Yes, but do you like being averse?"

I'd much rather it was something else.

One time I got very interested in this because it struck me that, of course, if there's aversion, aversion is a response to pain. So if I'm averse most of the time, I'm feeling pain most of the time. There's a painful quality to it. So I started to get interested in this.

The way that I worked with it was I'd just be doing my normal meditation, but when I felt that I was quite settled, I'd drop in the question. Basically, I'd look for any manifestation of aversion, particularly the subtle ones.

For example, I was doing walking meditation along a veranda. Everything was going really smoothly. It was a good day. It was a good walking period. And I see the end of the veranda, and this half-formed pre-verbal thought popped up in the mind: "It would be good to get to the end."

And I thought, "Wait a minute, why? If it's good to get to the end, that means it's correspondingly bad to be here—which means this must be unsatisfactory in some way, although I haven't noticed it. So what is it? What is the pain here?"

I would send the awareness: "Okay, what's the pain?" And I would ask the question, "What is dukkha?" So I would drop down and try to find what's the painful quality of this. It has to be there because there's just a twinge of aversion.

I started to explore it in that way, and it got really interesting. What I found most interesting is that when I went down to look for the pain, the closer I got to it, the more it disappeared.

I remembered a teaching I got from Sayadaw Utejaniya on the first retreat I did with him. When I was reporting experience—which is quite common for me—I was often reporting painful experience. Lots of dukkha.

On the last day of the retreat, when the retreat was over, I came across Tejaniya in the corridor. He wasn't speaking much English at the time; everything was through an interpreter. But he sees me, and he comes bowling up to me. He looks me in the eyes and says, "No dukkha," and marches off.

Investigating vedana—this feeling tone that underlies all experience—reveals profound insights about the nature of dukkha itself. When I truly investigated this during that retreat, it became bleeding obvious what Sayadaw Utejaniya was pointing toward. Fundamentally, there is no dukkha.

This investigation of vedana involves cultivating an interest in the feeling tone, the feeling quality of experience, however it presents itself to you. It's not a standardized package that fits everyone, but rather a process of becoming sensitive to the feeling aspect of being here in this place at this time, and then sending awareness to it. What is this clarifying? How does this work? The key is getting genuinely interested in it.

When deep concentration arises, something remarkable can happen. Pain might transform into elements—pure heat, movement, sensation without the overlay of suffering. But what does this mean for our understanding of vedana? If it's no longer actually painful, is it pleasant? The conventional categories suggest we can only have pleasant or painful.

I think it can transcend those three categories altogether—pleasant, unpleasant, and neutral. There might be delight in the pain becoming manageable, transformed into heat and movement. There's pleasure in the relief that comes when suffering ends. But beyond this, there's the recognition that pain itself is just another concept.

Sometimes what emerges is genuine neutrality—not exactly delighting in the experience, but not suffering either. You might find neutrality in the very disappearance of painful sensations. This is seeing into the nature of pain itself. What exactly is pain?

Pain is actually a package deal. You get sensation, but you also get aversion. These elements mutually support each other—if you don't have aversion, you cannot have pain. When you tease that package apart through clear seeing, there's no pain. The sensation might be exactly the same or completely different, but there's no pain. What remains is pure sensation without thought, without commentary.

In that experience, you might feel genuine neutrality—a sense that everything is simply okay. It's not wonderful and it's not terrible; it's just totally okay. This can be quite fascinating, though some meditators actually grow bored with such subtlety after a while. There's nothing you can grab onto as being anything in particular, and the very spaciousness of it can feel uninteresting to minds accustomed to drama.

What Sayadaw Utejaniya was suggesting is that vedana itself involves judgment. What happens when you simply don't make that judgment? This is essentially the heart of the Vipassana technique—sensing every sensation without judging it as pleasant, unpleasant, or neutral.

This investigation opens fascinating paradoxes. Many of us discover we can actually enjoy pain to some degree because it provides such a clear, concentrated experience to rest awareness upon. Even more intriguingly, we might enjoy emotional pain because it feeds our sense of self. You can observe this clearly in meditation when painful emotions begin to dissolve. An alarm arises: "Oh my God, if I don't think about this anymore, what will happen? I'll disappear!" And so the mind regenerates the pain.

There's a strange reassurance in pain, and that reassurance carries its own pleasure—the pleasure of knowing "I am a person who suffers from this." The very identification with our pain becomes part of how we know ourselves to exist.

This is the profound territory that opens when we begin to investigate vedana—not just noting pleasant and unpleasant, but seeing through the very mechanism by which experience gets categorized and how those categories create the sense of a someone who is experiencing them.

Yes, and there's a pleasure in that. There's a pleasure in, there's a satisfaction in being quite clear about that and finding a ground with that. So that would then be not neither pleasant nor painful. That would be a mix of definitely pleasant and definitely painful.

Again, these are categories. So they're concepts. A concept has a fixed border. Like, if it's pleasant, it's not painful. Obviously. That would be a contradiction and philosophers would be hammering at you. But in terms of experience... Experience doesn't have the border. Experience is not tidy. And so something can be simultaneously pleasant and painful. In fact, people experience it that way.

So again, that's the danger of concept. If you bring too conceptual a framework to the practice, then you start to mess up the experience to try to make it fit the concept. And this is the problem of the fundamentalist in every approach. So the concepts are useful, but don't let them take over.

CHAPTER 9

Tracking Experience

Patrick Kearney · 1h11

> *Patrick Kearney explores the heart of satipaṭṭhāna practice - what he calls "tracking experience" rather than mere contemplation. Drawing from the Satipaṭṭhāna Sutta (MN 10), he examines the Buddha's instruction that practitioners live "tracking body as body, feeling as feeling, heart-mind as heart-mind, phenomena as phenomena, ardent, clearly understanding and mindful."*
>
> *Kearney translates the Pali term "anupassanā" as "tracking" - following experience over time rather than thinking about it. Using the memorable "follow that car" analogy, he illustrates how meditation requires following wherever experience leads, not controlling its direction. He explores the three essential qualities: ardency (ātapa) as balanced effort like tuning a musical instrument; mindfulness (sati) as remembering awareness; and clear understanding (sampajañña) as the practical wisdom needed to develop meditation as a craft.*
>
> *The talk addresses common meditation challenges like distraction and self-judgment, emphasizing that recognizing distraction is itself mindfulness. Kearney discusses how satipaṭṭhāna is meant to be our normal dwelling place (gocara), requiring flexibility and sustainability rather than rigid technique. He concludes by examining the instruction to surrender "longing and sorrow for the world" (abhijjhā-domanassa) as an ongoing process of letting go of emotional imbalance.*

Tonight I want to explore the central practice of satipaṭṭhāna, that of tracking experience. On a previous night we looked at the udesa, the introduction to the discourse, and we got as far as the one-way street and Nibbāna. Today we'll move on and examine how the Buddha summarizes the basic practice.

He's talking about the practitioner surrendering longing and sorrow for the world. She lives tracking body as body, feeling as feeling, heart-mind as heart-mind, phenomena as phenomena, ardent, clearly understanding and mindful. So there are four satipaṭṭhānas: body, feeling, heart-mind, and phenomena. The Buddha repeats the same sentence for each one, and as we mentioned, repetition indicates importance. This sentence is crucial.

What it's all about is what the Buddha calls anupassanā, usually translated as "contemplating." So contemplating body as body, mind as mind. But I prefer to translate it as "tracking." In Pali it's anupassanā. Passanā means seeing, and anu is a prefix denoting "along." When we see something, the relationship is direct and immediate—there it is. But "seeing along" implies following it over time, tracking it.

I don't like using the word "contemplating" because it could possibly imply thinking about something. This is not thinking about. Rather, it's following something, tracking something over a period of time.

There are two aspects to this practice. First, direct the mind towards an object of experience. Direct awareness and then ground it on this experience. Mindfulness has this very earthy, grounded quality to it. We ground awareness on something, creating a very direct encounter with the experience.

The object of awareness could be anything. For example, it could be a very specific object that we think is really important and that our guru says you must become intimate with in order to become enlightened—breathing, for instance. It's the generic meditation object. Or body sensation, or whatever. Alternatively, it might be grounded on the awareness itself, rather than the object of awareness. This is more like a space within which experience comes and goes, things arising and passing within a broader space.

But whatever it is—whether obvious like the body, extremely subtle like awareness itself, or anything in between—the first move is to directly ground awareness on something. This is central.

Then extend that encounter continuously over a period of time. This is the second aspect, the tracking aspect. If I'm going to track something, follow it, that implies time. The word mindfulness itself implies time. Mindfulness, remember, is a translation of the Pali word sati, which literally means memory. How can you have memory without time?

When we track something, we don't track it just for a moment. In one moment it doesn't go anywhere. Tracking something requires cultivating an ongoing relationship over a period of time. This is central to this practice.

When we track something, it's not up to us where it goes. Our job is to follow it. This again is a fundamental principle. This is what I like to call the "follow that car" principle. You know in the movies when someone leaps into a taxi cab and says "follow that car." The taxi cab driver is excited because he's been waiting for this for twenty years because he's seen all the movies. So off he goes. Imagine you're the person who's just leapt into the cab and you're sitting beside the driver, following that car.

You've got to follow that car. And fortunately the taxi cab driver seems very skilled, weaving in and out of traffic. So you're settling back and relaxing, no problem. And then at a certain corner, the car you're following turns right, and without hesitation, your taxi cab driver turns left.

Now, at this point, would you be a happy chappy? Would you be content? Would you be thinking of the large tip you're going to give this taxi cab driver? No, you might be, in fact, irritated. You might even remonstrate with the taxi cab driver.

But the taxi cab driver could explain he's got perfectly good reasons for turning left. The taxi cab driver might be a hippie and it just felt right to turn left. He just wanted to express himself. He just felt that his inner dolphin told him to. Or it could be that he was absolutely dead set certain that car was going to turn left. He was absolutely certain of it. It just took him completely by surprise when it turned right. Or he could say, "Look, the view this way is much more interesting. It's terrible that way. It's much better this way." He could have all sorts of reasons like this, but would you find them convincing? No. The instruction is simple: follow that car. That's it.

Satipatthana works in exactly the same way. When we're tracking experience, we don't care where the object goes or what happens to it. That's not our business. Our business is to follow it and to understand whatever happens to it. That's all.

And although we might criticize the taxi cab driver, in fact as meditators we behave like that taxi cab driver pretty much at almost every intersection.

So this practice has a degree of unpredictability built into it. It's simply part of its nature. If you've got just a single meditation object to follow, well that's hard enough and that's unpredictable enough. But when the basic principle is it doesn't matter what the object is—the object could be body, could be feeling, could be mind, could be phenomena, roughly speaking everything—the unpredictability becomes massive.

This unpredictability in turn requires a degree of flexibility in the meditator. You can't afford to be rigid in what you're doing. Maybe it might work in some other form of meditation practice, which is just do this one thing: here's your meditation object; every time the mind wanders away, just come back to it. You can afford to be rigid maybe, and it might even pay off to some extent. But with this practice, it just doesn't work. It's a complete schmozzle.

So the attitude of the practitioner: it does not matter what happens. And this is really important. It genuinely does not matter what happens. What matters is that we are aware of what happens. That's the key point.

Now the forms that this practice takes are multiple. Let's just take a single lineage, the Mahasi method.

So you start with Mahasi himself, then his students, then his students' students. Let's stay several generations down the line, but stick to his students and his students' students.

These days, on one side, you have Sayadaw Tejaniya. For Tejaniya, he really doesn't care what it is that you're mindful of. What he's interested in is the mind which is mindful. He's really interested in that.

With Tejaniya, if you were doing a retreat with him, and let's say you just got really fed up with sitting in the hall and meditating, and you decided, "I think I'll go to the pub." So you wandered off, went down to the pub, sank a few—or possibly more than a few—weaved your way back to the center, and then went into the interview and explained what you had just been doing, he wouldn't bat an eyelid. But what he would want to know was: What happened when you did that? What happened in your mind when you did that? What was the experience of getting really fed up? What was the experience of heading to the pub? Were you mindful of downing those beers? How did consciousness change? How did the body change? What happened when you came back? And he would be genuinely interested.

He's quite strong on the principle that it doesn't matter what the object is. It doesn't matter what the experience is. It doesn't matter if you're inside the meditation hall or outside the meditation hall. What he's interested in is the mind which is aware—what's happening in that mind.

On the other end of the spectrum, you have somebody like Sayadaw Upandita. When I was working with him back in the day, we had the standard instruction: primary object in the sitting, rising and falling of the abdomen; secondary object, whatever else happens. But in practice, you'd give essays on the rising and falling of the abdomen and brief mentions of the secondary object. He was very fixated on rising and falling of the abdomen. Great precision and detail. I used to write little essays on it. I couldn't do it now—well, I suppose if I tried, but I don't think I ought to try. It's pretty intense.

There's one of the classic Upandita stories about a meditator who went there and in the course of meditating had some profound spiritual awakening experience. He was overwhelmed by gratitude and joy to the old guru that under his beneficent guidance he had had this experience. At the next interview, he was explaining all this to Upandita

and expressing his gratitude and so on. Upandita heard him out, waited until he stopped talking, and then said, "This experience that you had—did it occur on the rising or the falling movement of the abdomen?"

The guy says, "I don't know."

And Upandita says, "Please, be more mindful," and throws him out.

Radically different approaches, even in the same lineage using the same method. There's tremendous flexibility built into this because satipatthana is so universal. You cannot pin it down.

This is bound up with the fact that, as the Buddha emphasizes, satipatthana is meant to be our normal dwelling place. He calls it the gochara. I like the word gochara. It's a technical term, and roughly translated it means cow paddock. Gochara—G-O-C-A-R-A. Go is cow and chara is where one wanders. So a cow paddock.

And satipatthana is our cow paddock. In other words, our territory, our own base. This is where we live.

Let's say I'm a dedicated practitioner, and let's say I'm a dedicated Mahasi-wala, and let's say I'm going to really crack this rising and falling of the abdomen, and let's say I throw myself into it with absolute dedication. The fact is, I am a visitor to that cushion and to the rising and falling of the abdomen. No matter how dedicated I am, I cannot live there. But satipatthana is meant to be someplace where we live. So it has to be more than a meditation technique. There's more to it than that.

Basically, satipatthana is about cultivating a particular relationship to experience—all experience, any experience—in which the nature of the experience itself does not really matter. What matters is the quality of our presence to the experience.

And this relationship requires that the practitioner develop three qualities: ardency, clear understanding, and mindfulness. "Here a practitioner, surrendering longing and sorrow for the world, lives tracking body as body—ardent, clearly understanding, and mindful."

None of these words are accidental. These discourses are very tightly composed, and if the Buddha is using a specific word, he's using it for a purpose. So let's examine these three qualities: ardency, clear understanding, and mindfulness.

The first, ardency, is atapa in Pali, derived from the verb tapati, meaning "to burn." So atapa literally means heat, referring to the passion, commitment, determination, and effort required for this practice. This naturally brings us to the question of right effort, one of the factors in the Eightfold Path.

Now, again, satipatthana is something meant to be lived—something meant to become our normal, habitual dwelling place. If that's the case, then this passion, commitment, determination, and effort cannot mean strain. If we are pushing and straining, at some point we will collapse. We simply cannot maintain it. Then perhaps we pick ourselves up and push again, only to collapse once more. This creates an on-again, off-again relationship to the practice, which doesn't work.

Effort, or vayama, is the usual term—though I don't think there's any exact equivalent in English. Effort is reasonably close. Vayama represents the active or doing aspect of the practice: what one does, the project, the whole sense of something to work at.

In the Eightfold Path, when the Buddha talks about meditation practice, he mentions right effort, right mindfulness, and right concentration. Concentration is not active—it's peaceful, still, calm, receptive. At the other end you have effort, which is the active part. Mindfulness sits in the middle as the balancing factor. So effort represents the active aspect of the practice.

Sometimes instead of vayama, the Buddha uses virya. Both come from the same root: vir. Words from this root indicate strength, commitment, determination, perseverance, and courage. In yoga, for example, you have virasana—vira asana—the posture sometimes translated as "the posture of the hero." A vira is a strong person, a hero. When Sayadaw U Pandita talks about effort, he calls it "heroic effort" because he's emphasizing that root.

If you examine these factors, you'll notice something important about mindfulness: we can have too little mindfulness, but we cannot have too much mindfulness—it's impossible. With effort, however, we can have too little effort or too much effort. So effort behaves quite differently from mindfulness.

When the Buddha talks about right effort, he compares it to music, creating a sense of harmony. The classic story is his encounter with Venerable Sona. Sona was an aristocratic young man who got religion, ordained, and became a bhikkhu. In his lay life, he was an accomplished musician who played the vina, a stringed instrument.

Sona was one of those eager young men who wanted to race to full enlightenment as quickly as possible, and he habitually made way too much effort in his practice. Apparently, the breaking point for his fellow bhikkhus came when they noticed blood on his walking track. They brought in the Buddha, who spoke to him.

When the Buddha approached him, Sona was actually getting disheartened and thinking of quitting. Despite putting in incredible effort, he wasn't making any real progress and was becoming very discouraged—it was all too hard.

So the Buddha spoke to him about his practice of music when he was a layman. The Buddha asked him, "When the strings of your vina were too tight, was it well-tuned and easy to play?"

Sona naturally replied, "No."

"When the strings were too loose, was your vina well-tuned and easy to play?"

"No."

"When its strings were neither too tight nor too loose, but adjusted to a balanced pitch, was your vina well-tuned and easy to play?"

Yes.

So effort is like tuning the strings of an instrument. And what you're looking for is a balanced pitch. The Buddha goes on to say, "So too, Sona, if effort is too forceful, this leads to agitation. And if effort is too weak, this leads to stagnancy. Therefore, Sona, resolve on a serenity of effort. Attain balance of the faculties there. Take up the meditation theme."

I love this expression, "serenity of effort." We wouldn't normally think of combining those two qualities. But the Buddha is saying that's precisely what we need, because we need the balanced pitch—the sound has got to be just right. Not too much of this, not too much of that. So establish a balanced attitude and then follow the theme of the music.

The theme, of course, varies depending on the conditions. The music that we're playing when we do the practice changes from day to day, hour to hour. But whatever tune is being played, effort or ardency represents the tuning of the instrument. If the tuning is just right, then the music can be played harmoniously and without strain.

So effort is crucial, and one way of learning to discern when we're making right effort is basically through sustainability. What can I sustain throughout a day? What relationship to experience can I sustain throughout an entire day?

On a few days we've been doing exercises in the morning where we're looking very closely at the elemental quality of the experience—sensation, breathing, and so on. Could I maintain that all day long? No. At least I couldn't. I could do it when the mind is really clear and sharp.

Now in my case, my biorhythms are such that I'm very slow to wake up in the morning and my energy peaks mid-afternoon going into early evening. This is why if I'm doing a stretch in the morning exercises and it's lasting a long time, just check and see if I am in fact awake. Because sometimes I just fall asleep during them.

So when I'm going to do the detail exercises, I'm much more likely to do it in the period mid-afternoon to mid-evening because I'm awake then. But in the morning basically my meditation consists of staying upright without falling asleep. I find this quite a challenge.

So it varies in any given day from hour to hour simply based on biorhythms. And then there's how long into the retreat it is. Well, the effort that I make at the beginning of the retreat is very different from the effort that I'm making towards the end. It changes. It becomes more refined. Overall, the mind becomes more refined, so the nature of the project necessarily changes.

And then there's the movement of the moods and emotions, and then there's whether or not the body is sore and how it's sore, and then there's all these other factors. So it keeps changing and the way that I relate to the practice has to keep adapting. It's not making the same amount of effort all the way through.

In fact, one of the reasons why "effort" is a poor translation is that viriya or vāyāma have both a subjective and an objective side to them. Objectively, it's energy. Now sometimes the mind has a lot of energy, and sometimes it does not. And that's just an objective fact.

If the mind has this much energy, and I'm practicing with this much effort, this is a serious problem. I'm just going to tie myself up in knots. On the other hand, if the mind's got this much energy and I'm practicing with this much effort, equally, I've got a problem. Stagnation.

So, finding the balance. And I'm not in control of the amount of energy. There are some things I can do to improve it, but in any given moment, it is what it is.

Subjectively, this factor of samma-vāyāma is what we call effort. Now that's subjective. Regardless of the conditions, what's my relationship to it? And for me, effort is essentially choice. It's a choice made now to be aware of this. And it's a simple binary.

I either make the choice now to be aware of this, or I don't. And it's very simple. But the problem with it is that I have to make the choice now. And then I have to make it now. And then I have to make it now. And then I have to make it now. This is where it becomes difficult. I can't make the choice at the beginning of the sitting and think that that will somehow sustain me throughout. It won't. So right effort is a very interesting one.

Now to ardency. There we have mindfulness. We're changing the Buddha's order a bit. He says ardency, clear understanding and mindfulness. But I'm looking at ardency, mindfulness and clear understanding.

Mindfulness—*sati*—is at the center of this practice. As we've already talked about, it's essentially remembering awareness. It has two flavors: remembering I am already aware, and remembering to be aware of this.

We can see these flavors in our relationship to distraction. Sometimes when we emerge from distraction, we come out of it with the realization: "Oh, I'm distracted. I'm thinking, for example." This is remembering I am already aware—in brackets, of this distraction. This flavor of mindfulness is particularly relevant in everyday activity. Mindfulness remembers: right now I'm seeing, right now I'm thinking, right now I'm hearing, I'm moving, I'm touching, I'm reaching, I'm happy, I'm sad, and so on. Something is happening right now, and this flavor of mindfulness is remembering, "Ah, this is happening." Of course it doesn't matter what's happening—it could be anything.

You notice that sometimes when we emerge from distraction, at the very moment we realize we're distracted, the distraction itself vanishes and awareness goes immediately and spontaneously—bang—back to the meditation object. Has that ever happened? This is that second flavor: remembering to be aware of this, my meditation object. This is the flavor we find particularly when we do formal meditation practice. We're training ourselves to remember this.

If I'm sitting and my meditation object is the whole body, or it might be the breathing, or body sensation—whatever—I'm training myself to remember this particular experience. These are the two flavors of mindfulness.

To return to that basic principle we've already discussed: fundamentally what's important is the tracking, the remembering—not what we remember. That's of secondary significance. The practice is reminding ourselves of our awareness, reminding ourselves I am already aware, reminding ourselves to be aware of this, not to forget this meditation object.

As practitioners, we face practical questions: What should I be mindful of? And how should I be mindful of it? These are craft decisions—the decisions we make as we learn a craft, and through these decisions we become better at the craft. It's like a carpenter reaching for the right tool to do this particular job.

In that action there are at least two aspects. First, the awareness of reaching for the tool, the touch of it, the awareness of using it. Here the quality of awareness itself is central, and mindfulness serves the purpose of clarifying and stabilizing the mind, making that awareness clear and continuous—the awareness of the activity itself, using the tool.

Then there's the choice of what tool to reach for in this particular set of circumstances. Which tool will fit this particular job, and how to use this particular tool? This is what should I be mindful of, and how should I be mindful in this particular set of circumstances.

There are different techniques we can use, and each morning we're experimenting with a different one. It's not that there's one right technique. It's not that we're going through a curriculum where once you tick all the boxes, that's it. We're simply playing around with different possibilities to get a sense of what's available. Because each of us, in the course of a lifetime, will face every conceivable experience being thrown at us.

So how do we work with it?

This brings us to clear understanding—*sampajañña*. This is all about the craft, about learning the craft and the wisdom that comes from the craft. The Pali term *sampajañña* is based on the root *ñā*, to understand or to know. Another root based on that same foundation is *paññā*, wisdom. *Sampajañña* is a kind of ground-level wisdom, a practical, ground-level wisdom. And it's associated with the recursiveness of mindfulness.

Mindfulness is more than simple awareness. It entails awareness of my awareness. It's not simply that I'm aware—I know that I'm aware. I know what I'm aware of. So mindfulness is found in that recursiveness. *Sampajañña*, clear understanding, monitors and watches over the flow of experience.

We've been talking about the craft of meditation. This always involves what the Buddha calls *yoniso manasikāra*, which can be translated as appropriate attention. Sometimes you see it translated as methodical attention, or wise reflection. There are two different aspects of *manasikāra*. One is conceptual, which involves reflection—the thinking about. For example, the kind of *yoniso manasikāra* that you would apply in a dharma talk. You're paying attention to the talk; it's conceptual. You're trying to understand it. And for the Buddha, this appropriate attention includes asking the right questions. It's an active engagement.

But then you have appropriate attention in a situation which is not conceptual, such as the meditation practice. This is all about the craft of meditation—how we construct our attention.

Sometimes it's appropriate to focus in very closely on a meditation object. Sometimes it's appropriate to step back from it. Sometimes it's appropriate to be very active, to go towards the experience, to engage it. Sometimes it's appropriate to step back and let the experience come to us. Sometimes it's appropriate to focus in on a very small object. Sometimes it's appropriate to open out and make the object very big, even bigger than the body. Sometimes it's appropriate to make more effort. Sometimes it's appropriate to make less effort. Sometimes it's appropriate to be still—standing, sitting, lying down. Sometimes it's appropriate to move. Sometimes it's appropriate to note pain and not try to avoid it. Sometimes it's appropriate to note something pleasant, to ease and soothe the *citta*.

There are all sorts of decisions that need to be made and all sorts of possibilities. This is all about learning a skill, and it's clear understanding that enables us to do this—this monitoring of the experience, what it does, how it behaves over time.

We're learning a craft, and it's a craft that is learned through trial and error. That's the only way to do it. In the beginning, what predominates is the error. This is completely normal. Mistakes and experiments play a really important role.

When we come to meditation practice, when we begin, what's our condition? Well, according to the Buddha, the fundamental condition of the human mind is one of delusion. And delusion has two aspects: ignorance—don't know—and a more positive state of misinformation.

I think I know, but I'm wrong.

So this is delusion, and this is the normal human condition—the package that we bring with us when we start a meditation practice. Looking back on my own experience, I see it very clearly, but as a teacher I really get to see it. It's astonishing how we come to a meditation practice with a whole number of assumptions about what it is and what's supposed to happen.

People turn up having never done a meditation retreat in their lives. They've either never meditated before or hardly ever meditated, and they walk into this retreat. Within one or two days they're really upset because what's supposed to happen isn't happening.

What? How on earth do you know what's supposed to happen?

"Well I do. I'm supposed to be calm and I'm not supposed to be thinking. My mind should be a blank."

What? It's astonishing—the absolute determination that even beginners have to cling ferociously to a fixed view and opinion of what their experience should be, when a moment's reflection reveals that the data upon which this judgment is based is non-existent, necessarily non-existent.

One time, a particular meditator was doing a retreat with John Hale, my old friend and teacher, and he was complaining to John in the interview: "I'm just not making any progress, I'm not making any progress."

John's response was to ask the question: "How would you know?"

And it was not a rhetorical question.

So when we start, we don't know what we're doing—quite literally—and therefore we make mistakes, obviously. And mistakes are really valuable. That's how we learn. If we didn't make them, we could not learn. We don't learn and then do things. We learn by doing things.

So we start doing it and fall over ourselves again and again and again, and we learn if we are paying attention to the whole process. And this is where the clear understanding comes in. I bump into a wall. Okay, that's not the right direction. I'll try another direction. I bump into something there. Okay, I've got to be more careful in the way that I steer.

Or I like to look at it as we're on the path—it's supposed to be the right path—and I'm proceeding along this path. On either side of this path there's a very steep ditch, and every now and again I find myself lying in the middle of it, staring up at the sky, or alternatively face down in the mud. At this point I know that I've left the path. And this is useful information. This is data which can be employed for useful purposes.

So this is the learning process. Nothing is ever wasted, and this is all part of clear understanding.

We monitor our own experience, both ourselves individually, but also in relationship to the tradition—what we read, the dharma talks, the discussions with teachers and with fellow meditators, especially more experienced meditators. We get a sense: this person might—well, this person definitely knows what they're doing.

So we apply our intelligence to the process. You could say that mindfulness, *sati*, is essentially presence. *Sampajanya* is intelligence. So this whole process, this whole practice, we could sum up as the practice of intelligent presence: to be present, but to do it intelligently.

So we don't simply blindly obey orders. We monitor what's going on, we check, we ask questions. We look for the patterns, and in this way we learn a craft.

So looking at our sentence that we're examining here: "A practitioner, surrendering longing and sorrow for the world, lives tracking body as body, mind as mind—ardent, clearly understanding and mindful."

Surrendering longing and sorrow for the world. We'll just briefly go through the rest of this. First, this refers to the loss of emotional balance. The term translated as "longing" is *abidja*, which indicates a leaning out towards something. And the shadow of longing is sorrow. If you have one, you have the other. If we want, then we don't want.

If I want this, I don't want that. If I'm happy when this occurs, I'm sad when that occurs. So longing and sorrow naturally pair off. This pairing is essentially shorthand for all the emotional entanglements we become lost in.

The Pali word is *abhijjhā*—A-B-H-I-J-J-H-Ā. The word for sorrow is *domanassa*—D-O-M-A-N-A-S-S-A—which generally means any kind of non-physical pain. In normal contexts it has a broader meaning, but here it's specifically paired with *abhijjhā*. The prefix *abhi* is not a negation, but rather a heightening, as in *abhidhamma*.

Think about the work we do on posture. When the body and mind are perfectly balanced, we feel completely at ease. If the body is in right posture and the mind is in right posture, we simply feel completely present. Then something happens—something disturbs us and we lose that balance, and we lean out. It might be physical.

Have you noticed that sometimes when you're sitting and caught up in thinking, when you come out of it you notice that the body has moved? With me, I'll be sitting and fall into thought, and when I emerge, I find myself leaning forward like this. All the energy has gone up into the head. There's a loss of balance in the body itself, which reflects the loss of balance within the mind. The body leans out.

Or we lose balance in the mind. The mind is present, and then suddenly it slides out. Sometime later we wake up to find ourselves either in the past or the future. Again, it's this same loss of balance—a falling over.

This is longing and sorrow for the world. The practitioner is asked to surrender longing and sorrow for the world. This is an ongoing process. It's not that first we surrender longing and sorrow for the world and then we do the practice, although some early translations gave that impression because of the various possibilities of translating that particular construction.

In early translations you see it rendered as "having surrendered longing and sorrow for the world," which gives the impression that first you drop the longing and sorrow, and then you start the meditation practice. It's a phenomenally awful translation. It just makes you stop. When I read it, I think, "Oh, forget about it." I can't even start—the bar is set so impossibly high that no one could meet it. You have to do it before you start. It's just poison. But it's grammatically valid to translate it as "surrendering longing and sorrow for the world."

There's a similar instruction with some practices—an instruction to "put aside worries and concerns," putting aside those things, then establish your awareness on an object. It could well be the same construction. The instruction is practical, giving you directions for what to do when you sit down to practice meditation.

Putting aside is acceptable—it's when it says "having put aside" that creates problems. You have to successfully put it aside before you can start. But "putting aside" works because you do it over and over. It's part of the process.

Certainly what I'm emphasizing here is that the surrendering of longing and sorrow is part of the ongoing process itself.

The key point is that the surrendering of longing and sorrow is not a preliminary activity before we begin the real practice—it's part of the whole process. It's like what you were saying with that expression: it tells you what to do. What should I look for? Longing and sorrow for the world. And when I get caught up in it, what should I do? I should let go of it. Let go, let go, let go, let go, let go. That's sort of the ultimate result of the practice.

And you can also use this as a measure of progress: Am I making headway? Well, to what extent am I surrendering longing and sorrow for the world? Again, it's an ongoing process.

This text wasn't written exclusively for monks and nuns, but rather for the bhikkhu. Bhikkhu in the sutta context means any meditator, any committed practitioner. We know that in the Buddha's time there were lay practitioners of satipaṭṭhāna, including very accomplished ones, because they get mentioned by name. There was a flourishing lay meditation culture at that time. In one of those lists—there are lists of excellent practitioners, excellent male lay practitioners, excellent female lay practitioners—I've looked for my name but couldn't find it. Must be an inadequacy of the translation.

So, longing and sorrow for the world... the practitioner lives tracking body as body, mind as mind. Now this tracking body as body, mind as mind—again it's the relationship. It's the Buddha hammering this direct relationship: body is just body, this sensation is just this sensation, that's it. This thought is just a thought. That's it. This emotion is just the emotion. End of story.

So we're facing it directly, but recognizing it's just what it is, not adding anything extra. And when I do add something extra, because I have longing and sorrow for the world, then it comes back to: it's just longing, it's just sorrow. That's it. That's all it is. So again, it's hammering this direct relationship with the experience—a relationship which becomes one of complete simplicity. We'll talk about that later on.

In conclusion, it's all about mindfulness. Mindfulness is memory. The opposite of memory is forgetting. When we practice, we find that we forget again and again. We forget and we wake up in our stories, we wake up in longing and sorrow for the world. This happens again and again and again, and it's natural that this happens. It's our habit to forget. This is a habit we've been working on for decades, so we're going to forget many times. This does not matter. What matters is the remembering. That is what matters.

For example, as meditators we often have this attitude: I'm meditating away, I fall into some kind of distraction, and sometime later—could be a nanosecond, a second, a minute, an hour, a day, a week, a month, whatever—I suddenly remember, "Oh, I'm supposed to be meditating." And at that point, often what we will do is start to flog ourselves: "Oh, dammit, forgot again. This is ridiculous. I've been doing this for years. I still fall into the same bloody habit. Oh, this is hard. This is way too hard. I think I should take a break. I think I should give up the whole bloody thing. It's just hopeless." Five minutes later: "Well, I'd better get back to the meditation."

Now, let's say I've had this amount of time that I forgot. Then suddenly I remember, "Oh, I'm distracted." This period, I can't do anything about it. Then I remember, "Oh, I'm distracted." And then: blah, blah, blah, blame, blame, blame, complain, complain, complain. There's another gap here, and this one is all my own loving work. It's completely unnecessary.

When I wake up, when I know, "Oh, I'm distracted," that is mindfulness. Sometimes people talk about...

And Hogan's son instantly said, "But that's not Zen."

Now Zen people never do that. They never ask what happened next. Because in Zen, it's all about now, now, now, now. There is no next.

So it was interesting to me to see the difference in emphasis. In Soto Zen, there's this very strong emphasis on the immediacy of this moment. In Theravada practice, there's more emphasis on tracking the flow of experience over time. But I think both are necessary.

If you're only in the immediacy of this moment, you don't learn much about how your mind works. You don't start to see the patterns. You don't develop that wisdom that comes from understanding the mechanics of your own experience.

But if you're only tracking over time, then you miss the intimacy of direct experience. You become too much in your head, too analytical.

So we need both. We need the immediacy of mindfulness in this moment, and we need the broader understanding that comes from sampajanya, from monitoring how things unfold over time.

This is why when I'm distracted and I suddenly know I'm distracted, that's already mindfulness. I don't need to get back anywhere. But then I might also step back and ask: How did that happen? What led to that? What's the pattern here?

Both perspectives are valid. Both are part of the complete practice. The immediacy gives you the direct taste of awareness. The broader view gives you wisdom about how your mind operates.

And this is really important to understand, because otherwise we can get into this game of constantly trying to get back to something, as if mindfulness is somewhere else. But mindfulness is right here, in the knowing of whatever is happening now.

And at this point, Hogan could no longer control himself. He said, "No next. Just this!" It was like—biff! It would be interesting to watch a conversation between him and Upandita.

That response is very, very Zen. But Upandita's question is very, very Theravada. Theravada emphasizes development over time, how things unfold over time. In Zen, they don't give a damn about how things develop over time. They just want bang, right now. So it's like two sides of the coin.

And I think you need both. One of the weaknesses of Zen, for example—in Theravada, we really emphasize process over time, and we also really emphasize ethics. Because to see how ethics works involves process over time. I did this, and this is the result. It's not a good idea. In Zen it's all "just this, just this, just this," and they're notoriously weak on ethics. They got into a lot of trouble in America, and I think there's a connection between the two.

But for me, you do need both of these views. Sometimes what I'm saying belongs to this broader view of process over time, taking this wider perspective. And sometimes it's "just this, just this." This emerging out of distraction, I think, is a classic "just this" part of the practice—the opportunity to actually apply that, where it's very fruitful to apply that.

"Is that where we find our habits?" someone asked.

Well, that's where we discover what they are and what they do, what the effects are, how they shape our life. Then the immediacy is in the moment that the habitual tendency arises—bang, gotcha. Then I can do something about it. But that understanding will come within that broader context. Otherwise, I don't know the significance of it. I don't even know what to look for. I haven't trained myself to catch it because I don't know that it's significant. But because I've learned over time that it is significant, then I'm alert to it.

So that waking up moment, coming back—that's the moment that's really crucial because I'm coming back from something that maybe I habitually do. And that coming back is the arising of mindfulness. Now, mindfulness is unattached. It's not mine. It simply arises through causes and conditions. If I'm cultivating it, I'm cultivating the propensity for it to arise. So when it arises, this is a matter of celebration. To know that I'm distracted is a matter of celebration, because it means that my training in mindfulness is showing fruit.

"Is it possible that that beating up thing—oh bad me, bad me—that that's just yet another habit?"

Oh yeah, definitely. Some individuals are more inclined to it than others, and some cultures are more inclined to it than others.

"As a culture, do you think there is a general obstacle to practice because of our attitude to going somewhere—like the sense of achieving or just journeying through life?"

I think our culture is very goal-oriented, but that can manifest across many different aspects of society, for different individuals.

"Do you think, as a general cultural attitude, that's a difficult obstacle?"

I think preoccupation with goals is a problem. The Buddha emphasizes direction rather than goal. It's part of the whole idea about path. Is it going in the right direction or the wrong direction?

So for him, if I'm going in the right direction, I don't have to worry about the goal. The important thing is to set the direction.

But I don't know that our culture is any more goal-oriented than others. When I teach in Malaysia every year to Chinese people, they're pretty goal-oriented too. But they have a much easier time with meditation practice than we do.

Why? It's a very good question. I do have a hypothesis.

My hypothesis is that when the typical person in our culture looks inside themselves, they feel that at the very bottom of it all, I am fundamentally alone. And I think in Chinese culture in Malaysia, when they look inside themselves, they know fundamentally I am not alone. And I think that makes a huge difference.

They have a stronger sense of ancestorship and continuation. The whole family network and community network that hangs off that is so much stronger and more palpable.

The first time I realized this was when I was teaching a retreat with forty or fifty people, and at least a third of them were related to each other. They were actually related to each other, not just sharing the same last name. They come in family groups. There's this old woman sitting up the back with a middle-aged woman and a slightly younger woman beside her. Over there there's a husband and two daughters. In the meditation hall, this family networking is something you would never see in an Australian hall. You would never expect to see it, but there it's just routine.

How would that make meditation easier? The sense of not being alone eases the citta. Overall, they find concentration a lot easier than we do. They develop concentration much faster.

Anyway, we're speculating on psychology. We've wandered off the point, so maybe we should call it a night. Thank you very much.

CHAPTER 10

Tracking the Thought-Stream

Patrick Kearney · 1h05

> *In this dharma talk from a month-long retreat, Patrick Kearney explores the third foundation of mindfulness (satipaṭṭhāna) by investigating citta through direct observation of the thought-stream. Drawing on the Satipaṭṭhāna Sutta (MN 10), he addresses the common meditation obstacle of excessive thinking by making thought itself the meditation object rather than trying to suppress it.*
>
> *Kearney emphasizes that the problem is not thinking per se, but our addictive relationship to thought. He explains how we construct narratives with ourselves as the central character, creating identity through stories - a process intimately connected to the Buddha's teaching on self and not-self (atta/anatta). The practice involves learning to observe the process of thinking rather than getting caught in content, recognizing thought as another empty phenomenon arising and passing according to conditions.*
>
> *Through guided exercises, participants explore how thoughts appear (words, images, sensations), where thinking seems to occur in experience, and the relationship between awareness and its objects. Kearney draws on the Buddha's teaching of dependent arising (paṭiccasamuppāda) to show how understanding any aspect of mental process can lead to deeper insight into the constructed nature of experience and the possibility of stepping into the unconstructed.*

We've been looking at different aspects of the practice, starting with the body. Yesterday we moved on to vedana, feeling, experimenting with that. And today we'll start on the third satipatthana, citta, by looking in particular at the thought stream, making thought itself a meditation object. And we'll play around with this one.

Tracking the thought stream is for some people a very important part of the practice because it constitutes a major distraction for them. I know people in this room will find it difficult to comprehend, but there are meditators who feel, "If only I could stop thinking, then I could meditate. If only this thinking would even slow down, then I might meditate."

So the basic principle in this approach is: whatever comes up as a barrier, whatever is an obstacle, whatever is getting in the way, face it and make it the meditation object. This is implied in the Buddha's words, "establishing mindfulness directly"—establishing a direct face-to-face relationship with the experience.

Now in this case, the thought stream, the mind is constantly generating thought. It's like fire throwing up sparks. And this happens continually. And these sparks are like little elemental thought images, and the awareness will go, sweep in, grab one of them—any one of them—and then turn it into a movie. And then we get lost in it. And when that one runs out, the attention will grab another one, turn that one into a movie. When that one runs out of steam, there's another one there, and another, and another, and another. And so it goes.

The problem here is not the thinking. This is very important to understand. Apparently there's a new book out called "Thought is Not the Enemy." Of course it's also in most cases not an ally. What we do with thinking as a meditation object, as with any other meditation object, is basically what we're concerned with discovering or realizing: that it's just another empty phenomenon that comes and goes according to conditions. It's nothing special.

But what makes thinking difficult for the meditator is not the thinking itself, but our relationship to the thinking. And in most cases, that relationship is addictive. And it's the addiction which is the problem, not thinking. When we use thinking as a meditation object, really what we're interested in is the relationship to the thought, more than the thought, and certainly not the content of the thought.

Thinking is addictive because we create narratives, and you might notice that while we create this vast array of different stories, all of them have one thing in common, and that's the star of the show—and that's me. No, it's you. We use these stories to generate a sense of identity. Basically we're telling ourselves who we are, and we're doing this all of the time.

And so any kind of relationship to the thought stream brings us into the whole world of what the Buddha calls atta and anatta—self and not-self. We construct a self in part through our thinking.

The American philosopher Daniel Dennett points out that we do not think our thoughts—our thoughts think us. They create us. And he also points out that while we think about many different things, all of us have a few core narratives that are our favorites at any given time, because these are the ones that provide the most solid sense of identity. And Dennett goes so far as to say that the self is the center of narrative gravity. It's like where the narratives most likely end up—that is the self.

So when we take on the practice of making the thought stream itself the meditation object, this practice is closely related to anatta, the understanding of not-self, which is one thing that makes it particularly interesting. When we look at our relationship to

thought, what we're looking at is ourselves creating ourselves. When we let go of thinking, what we're letting go of is us and entering into a world in which we're not defined by our stories. And this is a whole different world. So this practice has potentially a great amount of power.

Let's backtrack a bit and talk about awareness, because in all meditation practices, but especially when we're making the mind itself the meditation object, then it's useful to remember this fundamental dyad that we've been talking about: awareness and its object. This is what we always work with—awareness itself and what we are aware of. There's always that basic dyad that structures everything.

Awareness itself is the presence of what is present, so awareness is not a something, but the presence of something. It's a quality rather than a thing. We gave the example: imagine stepping into a dark room at night and then turning on the light switch. Before flicking on the switch we don't know what is present. As soon as we hit the switch the room is illuminated, and the point is, of course, the whole room is illuminated and everything is revealed at once. Bang! So the light illuminates everything. But what we do is we tend to focus only on a few things within the room that are of interest and concern to us. So the attention immediately selects just a few familiar aspects of the room. Bang, there it goes.

Have you ever cleaned houses and then discovered in odd places layers of dust, and you've got no idea how it got there? Yet it was there in plain sight. I liked Jane's comment about vedana hiding in plain sight. The light illuminates everything.

Everything is available, but we don't see most of it because of where we put our attention. Most of what's going on we simply don't notice—it's invisible. But that doesn't mean it's not illuminated. That's part of the choices we make. Why we focus here rather than there is driven, of course, by vedanā. And so again, getting to know vedanā, you get to see this whole process of selection: I'll send the awareness here, I won't send it there.

I remember one example. One time I was doing walking meditation during a retreat, and the mind was particularly restless and couldn't focus on the walking. Then it occurred to me to note, or to name: avoiding what? As soon as I did that, it was like the awareness went bang to some element of discomfort in the mind, in the heart. To avoid that, I was doing all this thinking. The mind was generating all these stories to keep me away from here. So I just kept doing that—avoiding what? And when the mind would get restless again: avoiding what? Ah. Very quickly, everything was quite settled and I was right there. It was quite interesting.

Again, it was there. What was happening was there, but I just didn't want to look in that direction. But it was available. It was illuminated. I just didn't want to go there because it was unpleasant. And therefore, because I wasn't going there, it was dominating the entire experience. This is quite common when we practice.

So awareness is like the light. It illuminates. It brings everything into presence. But we organize awareness. Awareness will land somewhere in a particular location and it will construct some sense of meaning and coherency around that location. It will organize the contents of the room, as it were, in some particular way that makes sense to us and gives us a sense of meaning and even purpose.

Here's a rough example. Notice how you come to a place like this—you come to this place, in fact. You're going to be meditating here for a month and you try to get to the hall early so you can pick your spot. Then you gather the furniture, settle in, and every time you turn up here you go to that spot. Have you ever had the situation in which you walk into the meditation hall and someone's in your spot? How absolutely outrageous that is! So you sit down, but there's a certain amount of edginess because you've actually never been in this hall before. You've got to get used to it all over again.

This is how we work. This is how awareness itself works. It settles, it lands. The Buddha uses this term, the landing of awareness. Then it organizes itself around that location and gets comfortable with it. That's where we construct our sense of identity and our world.

We experience—we're not simply aware of, we are aware from. There's a particular place from which we are aware. Again, it's habitual; we're used to that. With the thought stream, we are aware of it from a certain place and we are used to aiming our awareness to certain aspects of the thought stream, usually content. When thinking comes up, what am I interested in? I'm interested in what I'm thinking about. What is significant to me? The content of the story. So it's always content.

What we're doing in this practice is reorganizing the normal habitual structure of awareness by learning to attend to what we normally ignore—things that are there and available but we normally just put aside. We normally ignore them because we're interested in something else.

So the key here in this practice is learning to drop any concern with the content of our thinking. The content is basically irrelevant—it has nothing to do with anything. I like to work on the principle that every thought I think is a lie, including the thought that every thought I think is a lie. I find this a very useful working principle myself.

Some people argue with me. They say, "No, no, no, some thoughts are true." I don't try to persuade them otherwise—I simply find this a useful working principle.

What we're interested in is not what we are thinking about, but the process of thinking itself. Thinking is a process—it's constructed and conditioned by something, and it in turn constructs and conditions something. That's what we're interested in. In other words, what the Buddha calls dependent arising. This is actually what we're interested in regarding everything: process. Things arise and cease—how they arise and cease. That's what we're interested in.

Sri Nisargadatta Maharaj compares this practice to a mother watching a child play with a favorite toy. The child is playing with the toy, and the child's focus is on the toy—that's what's important to the child. The mother is separate from this but really interested. She's not interested in the toy, however—she's interested in the child playing with the toy. You see the difference?

We are normally like the child, and our job is to become like the mother. It's not that we have to throw the toy away—the toy is not the problem. What we have to do is step back and watch the game. That's what's interesting, and that is what can teach us something.

We're going to do a few basic exercises in this. For each one, we will begin by settling awareness in the body, grounding ourselves there. From that foundation, at some point I'll ask you to direct your attention to the mind. We'll be looking at some aspect of the thought stream.

If you get lost—in other words, if you get lost in the content of the thinking—drop it, come back to the body, re-establish yourself, and then return to the mind. The body is always the background. In a sense, it's the body that thinks. Keeping a sense of this background is extremely helpful.

Any questions or comments before we get started?

If you would, settle into your meditation posture. From there, settle into your normal meditation object. And at this point, stop thinking. Just don't think. Stop thinking.

Any luck? Maybe no.

"A couple of times I asked myself, 'Am I thinking?'"

Were you thinking at the time?

"No. But I did think, 'Am I thinking?'"

But apart from that, you weren't?

"No. Images sometimes lead to thinking. So if I stop the images, I go back to the..."

So you had images, but you didn't turn them into stories. What category would images be in?

You notice how we have made no attempt to actually define thought? We've blathered on about stories, but that's for the next exercise.

Did anybody consider the exercise to have been a total failure?

They just kept thinking continuously?

I had images too, and I thought, well, there's only just thought, so...

So did you reflect on that? Did you think about that?

Yeah.

So you had images and then commentary on the images?

Yes.

What questions about images is this thinking? It's a very good question, of course. It's like, what is thinking?

Blake?

I have a few thoughts, but you told us not to think of the content. I was trying to think of other factors of thought, like the tenor or the sort of timbre of the thought, like a radio in another room. What sort of voice it had, that sort of feeling, what sort of qualities it had apart from the actual story of it.

Did you have a look at that?

Couldn't get there.

So all you got was the story?

The second one hooked me.

The reason why I do this first exercise, apart from entertainment value, is to illustrate the addictive quality of thought. A lot of people get really frustrated with this. It's a minute and a half, and I get the impression that some people spend a minute and a half

thinking, "What a stupid idea, what is he talking about?" But it illustrates the addictive quality. Basically, it's the classic story of the addict: "I can stop any time I want to. It's just that I don't want to."

This is the relationship that we're interested in. The thinking itself is mostly pretty pointless, but it's the relationship which is interesting. But as pointed out, we've so far made absolutely no attempt to even define what we're talking about. So this next exercise, we're going to look at what exactly do we mean by thought.

What we're going to look at is the question: how do I know that I'm thinking?

So if you get into your meditation posture, settle awareness in the body, and turn your attention to the mind. Are you thinking? If you are thinking and if you know you are thinking, then thoughts must be appearing to you in some way. How do thoughts appear? Do they appear as words? As visual images? As feelings? As combinations of these? As something else? Study the flow of these thoughts. Don't focus on their content, but on their appearance, how they present themselves to you.

How do thoughts appear? What are they?

How do they appear? Of course for the Buddha the question "what are they" and "how do they appear" is the same question. Because all there is is phenomena, appearances. They come and go.

I noticed that images appear and words appear, but with images it always seems that they just come out of nowhere. But with words sometimes they come out of nowhere. Sometimes I definitely get the feeling that I created it. So images just seem to pop up by themselves.

Yes, I don't feel they're created.

And some words pop up like that, but some words, there's a decision behind them. There's some kind of active agency.

So you've got images and words.

Yes.

And the words are sometimes written but usually they're spoken.

So sometimes visually they're written and sometimes just sounds.

There's a sense of body sensation and movement. So it could be words or not words. If they weren't words there was something which I would describe as body sensation.

So there's a physicality to the thought.

There's a fascinating range in how thought manifests itself. For some, it begins as pure body sensation—a movement, an energy that may or may not crystallize into words. The physicality comes first, then perhaps emerges into language, though it doesn't always make that transition. Sometimes thoughts simply surge around as body sensation, understood and known but never verbalized.

This embodied quality of thought feels distinctly different from fantasy or mental proliferation, which tends toward the disembodied. When thoughts remain at the level of physical sensation, there's both the bodily experience and the mental cognition—a knowing of the meaning without spelling it out explicitly.

The location of thoughts also varies significantly. Some practitioners notice words appearing in the head with heavy cognitive content, while others arise in the chest carrying emotional resonance. The affective quality seems to determine the physical location—different sources manifesting in different places throughout the body.

Visual imagery presents another dimension entirely. For many, planning or questioning naturally takes the form of internal pictures rather than words. Some practitioners even report experiencing internal sounds—not necessarily verbal but auditory nonetheless—a phenomenon that can feel quite novel when first noticed.

What's particularly intriguing is how these patterns shift over time with practice. One practitioner shared how their thinking had transformed through retreat experience. What once involved a complex combination of words, images, and internal commentary had gradually simplified. The verbal narrative had dropped away, leaving primarily visual imagery.

Even more subtle was the discovery of how quickly images can arise in response to sensory input. The sound of a bird call might instantly generate the faintest image of the bird in its tree—so subtle it almost went unnoticed. This reveals how imagery can operate below the threshold of obvious awareness, taken for granted while words and commentary feel more like an active narrative demanding attention.

This points to the layered nature of mental activity. Words operate at the surface, obvious and narrative-like, while underneath flows this stream of subtle imagery, working quietly in the background of consciousness. The practice of observing thinking reveals these usually invisible processes, showing us the true complexity and richness of our inner landscape.

At that particular time, it's a response to the feelings in my body—a response. Today I'm feeling particularly exhausted, and I keep coming back to this: arms of tiredness, "I don't want to do this anymore"—negativity, aversion, pushing away. It's a response to the body. So the condition of the body, the body's state, conditions the kind of thoughts that will arise.

"The sentence 'how do souls appear'—I felt like it could be used when I was doing it to make the souls like... not being there, to sort of go empty. Because when you think 'how do souls appear,' it's like concentration, and there's no thoughts."

"Like when you said before, 'stop the thinking,' I just felt like I was going to burst out laughing quite frankly. But 'how do souls appear' then? I find it like a trying goal. Where do they go? Where are they? You know, like... it's more like an emptiness than actually trying to stop it."

Trying to stop thinking is totally perverse—for most people. For some people, not. I tell this story. I've done these exercises for donkey's ears. Years ago, I was doing this introductory meditation once a week at the Buddhist library in Sydney. We did this exercise with these people who were coming once a week for introduction to meditation. And we did the first one: stop thinking. I said, "So, any luck?" And there was one young woman who said, "Yeah, it's like turning off a tap. You just turn it off."

Then we did subsequent exercises like this one, and the more we did, the more frustrated she felt. She was feeling like a complete failure at meditation because she couldn't do any of those exercises. Having turned the tap off, she couldn't figure out how to turn it on again. And I've often wondered what happened—how long did the tap stay off?

So there's this huge variety in the way that people respond. Some people can actually not think by making incredible effort to focus. But they say it's like there's this wall, and then the pressure on the other side of the wall builds. Then stuff starts to leak underneath. Then cracks appear. In other words, it doesn't work. It's not sustainable.

But in other ways, what you're pointing out is that if I actually focus on thinking, the more I put the spotlight on it, the more it disappears. But that also takes a lot of effort.

"I found it really strange, but I wanted to reach that point where the source comes from, and so it was all focus, kind of. So the thoughts have really more space because they're thoughtful."

That's very interesting when you do that. But of course, what we're looking for are strategies that we can employ over time. If a particular strategy requires a lot of effort, that's not sustainable. It's useful sometimes—you play with it and see what happens—but it's not sustainable. So we're looking for a relationship that is sustainable, a relationship to the thinking mind that we can sustain over a period of time.

"Is there a part in the suttas where I think the Buddha says the last resort for dealing with thoughts is to kind of crush them and squash them out of existence?"

Yeah, that's the last resort. And you wouldn't do it for long because you'd just get exhausted.

"I had this thought: what makes my thought different from sensations? And the other thing was the source of the thought, which was the mind."

So then I thought, they're like mind sensations. Like you've got a sore leg, the equivalent would be some sensation, not from the leg, but there'd be a thought that would be just the same irrelevancy as that physical sensation, but mental thought—just a coloring coming from the mind rather than from the body.

I like that expression—it's a mental sensation—because mind is a sensitivity and it's registering all the time. When we ask the question "what is thought?" one of the problems we have, again with language, is that our culture is impoverished when it comes to words that talk about mind.

You look at the Buddha—he has this rich vocabulary for different aspects of mind. And we just don't have these concepts. So we have "thought," and it just covers a huge amount of stuff. Whereas the Buddha has a whole number of different terms that look at different aspects of mental activity. And it helps because if you have a concept, it's like you have a direction with which to send your awareness. And it helps to become more sophisticated in your understanding of what's actually going on in the mind. The fact that the vocabulary exists indicates that it's being used by people who have this sophistication of understanding of what's going on in the mind. So it's something that we need to develop.

Shall we move on to the next exercise? Which has already been anticipated. This one is: where do we think? Where do you think?

So again, establish your posture and subtle awareness in the body. And from there, settle into your normal meditation object. Now turn your attention to the mind and in particular, turn your attention to the place where you think. Where do you think?

This is similar to locating the place where physical sensations arise. The difference is that physical sensations have physical location while the thought stream may not. People sometimes experience their thoughts in the general area of the head, and it may be useful to begin there. But don't take anything for granted. Where do you think? Is there a specific location? Is there more than one location? Does this location change? Or is there absolutely no location?

Where do you think?

Okay. Where is it? Where are the little buggers?

"I was finding a circle of the head and chest."

Oh, okay. No more specific than that?

"I could work out where they weren't, which was mainly the legs and arms. They definitely weren't there."

So the general area of head and chest, but you couldn't pinpoint it?

"No. But it was clear where they were not."

"So wherever your attention goes, that's where the thought is. Including outside the body?"

"I had a sense that I was perceiving them here, but I wasn't generating them there."

So that's in front of you?

"Yeah, in front of me was where I was perceiving them. But they weren't being generated there."

So they might have been projected from somewhere else?

"Yeah, but I couldn't find where they were. But you don't know where they're projected from. You've just got the finished product, and that's out here somewhere."

It's interesting. Two out of three is definitely outside the body.

"I had that same experience that Katie was talking about. However, when I realized that when I was generating, there wasn't a space that I was generating from. It was just in a different realm."

What do you mean?

Different realm. It wasn't like there was a tendency to place it somewhere in the body, but it's not a... We do that. We construct that. Yet where we construct it from is not in the body. It's not of the body. It's not in our realm.

So basically it doesn't have location.

No. Location in a physical sense. If location is described as physicality, then it doesn't have location. So it's not a case of not finding it. It's simply not there. There is no location.

"I thought you were generating my thoughts. They were coming from way behind you."

So there's a difference between where you experience them and where they're coming from.

"Is there? Something like that. Is there? Because I experience them anywhere. In me, out of me. I'm like... It's not the right word. I sense them anywhere. How they arrive there. Or where they arrive from."

Yeah, where they come from. That's a whole different issue. And you don't have any clues about that. You've just got them where they pop up.

"Yeah, where I experience them."

Where you experience them. But what's behind that or underneath that?

"I'll have to look into that."

Yeah, I think that's it. That is a very interesting question. And you notice how it's like something grabs you.

If you look at the way one's meditation practice develops over time, what direction it goes in. And people's practice goes in different directions. Many years ago I was talking to one meditator who said, "Let's say you have a meditation hall with twenty people inside it. Let's say that they've only meditated at the same place with the same teacher, following the same instructions, and none of them have had any experience of any other form of meditation or any other meditation teaching. If you went around and asked each one of them, 'What are you doing?' it would be twenty different answers."

So people, in meditation practice, head off. And this I've discovered as a teacher is definitely true. Because you get to hear other people's experience. It's amazing what people do. Your meditation practice over time heads off in a different area.

Now what determines the direction? To me there's basically two factors. One is: what are your obstacles? What's getting in the way? So you have to deal with that. If I've got a problem in my meditation practice, I've got to work with that. Because otherwise I just get completely bogged down.

And the other thing here is what I'm interested in. What is it easy to pay attention to? What I find interesting. And sometimes, of course, those two are actually the same thing. If you're interested in your obstacles—which is my case, I'm interested in distraction—

I find distraction fascinating. For me, the basic koan of my meditation life is, why is it that I can't keep my awareness on a meditation object for more than 2.5 nanoseconds at a time? Why? I'm really interested in distraction.

So if you find something interesting, go for it. Because it's easy to develop and maintain mindfulness on that if you're interested in it. And of course, if you're looking at an aspect of mind, this is fantastic, because seeing the nature of mind is very, very useful. And it doesn't matter from what point you enter.

This principle of dependent arising, this multidimensional network of conditionality—once you're in it, all the pathways will become available. The practical problem for most of us is how do we get in there? What's our entrance? So if you find something which grabs your interest and attention, go for it.

Again with this kind of exercise you get this huge variety of different responses that people get. People find their thinking in all sorts of weird places, inside the body, outside the body. Some people simply cannot find location—they just can't find it. And some people will declare with great confidence, it's not that I can't find it, it is that it does not apply. There is no location to thought.

I've had all of them. I've had times when I've been able to pinpoint the exact location of thought and I've had times where it just does not apply. Thought is both everywhere and nowhere simultaneously—it just doesn't apply. But the thing is with these exercises is there is no right answer, there's no correct answer. It's simply an exercise in directing attention into the mind and seeing what happens. Whatever happens is what happens. Every answer is the right answer.

The important thing is we're learning to look at the thought stream without getting caught up in the content. So the basic principle is find some aspect of the thought stream which is not the content and focus on it. And it doesn't matter what it is so long

as it holds your attention. And when you're not focused on the content you're not feeding the content and the whole thing collapses. And you're just watching the activity of the mind, which is extremely useful.

Sometimes you need to know enough about the content to know what hindrance is. Because if I completely ignore the content, how would I know if something was ill will or sense desire? What does ill will feel like in the body? It feels horrible. But that's how I know. There's always a step where I go, "That bastard... oh." But that's how I know.

In other words, basically there's one thing that the content of thought can tell you: the current state of your citta. We think that thinking tells us about what's happening in the world. We even think that it tells us what's going to happen in the world or what did happen in the world. But actually all it tells us is the current state of the citta. Which could also mean what hindrance?

So that is a useful piece of information that you can pick up. But it might be interesting for you as a meditation exercise to try to work out the hindrance without thought.

"Don't take the easy path of having someone tap you on the shoulder and tell you what it is. You should echo it in the body—it's definitely something in the body."

This brings up the issue of meaning. One of the basic functions of the mind is to give the experience meaning. So I can have something going on in the body which I'm very, very clear about. But what does it mean? Do I need some kind of story to tell me that? Or can I have meaning without the story, without the thought? Interesting question.

What can I experience without meaning? Can I experience without meaning? Or what do I, if I experience without meaning, what is it? I've worked with this—I got very interested in this a while ago—and sometimes there is experience without meaning. But the problem is that as soon as I notice it, it has meaning. As soon as I notice it, it has meaning. A function of awareness gives it meaning. Which is, "Oh, this is experience without meaning."

And I've already lost it. As soon as you notice it according to that dimension of meaning. But that meaning is a concept.

Yes, but it can be very subtle. Like in the example I gave—let's say I'm doing walking meditation and I look at the end of the track and think, "Oh, that would be good to get there." That indicates vedanā. But let's put it slightly differently: I look at the end of the track. How do I know that's the end of the track? That's meaning. Now I'm not thinking, but simply in the seeing there's a knowing that's the end of the track.

"Isn't it that to be aware you've got to have some sort of meaning? You can't be aware of things that don't have any meaning."

Is that true? I'll think about it this morning. Don't think about it. Try to find it. Don't waste time thinking about it.

"If it has no meaning at all, isn't it a bit like neither positive nor negative? Is it sort of irritatingly confusing?"

Is it? "Irritatingly confusing" is a meaning. It's the meaning that we put onto the experience.

When you look at dreams, when you start to do recollecting of dreams, you can give meaning to it if you want to. Meaning is what you ascribe to it. But watching the mind ascribe meaning is quite interesting, regardless of the question of whether you can not have meaning. Watching the creation of meaning and the investment that we have in it is really quite interesting. Again, this is an aspect of seeing ourselves create ourselves and our world. And in seeing this process, we are in that very action deconstructing. So we're approaching the unconstructed.

Peter?

"Words around that insight, which is great. And I'm really happy to have words to put around that. There's a good—I'm just thinking about it now—there's also a great felt sense as well. So it feels really good to get the insight that that's something I've been cooking on for a very long time. So I love having words that come to my brain around that time, in my thought process. They're very attractive."

Even for a normal human life, absolutely necessary. But it is interesting to see if you can get actually underneath that. And what is there, if there's anything?

Kim, did you want to say something?

"This is just to lean on something Katie said about hindrances. Last night I was feeling sleepiness, really gross sloth. Just go to bed. I hope this wasn't during the Dharma talk. It was. I thought, 'I'm just going to get out of here. I'm going to lie down.' But anyway, I thought, 'I can't leave. I've got to watch this.' And I went to the vedanā and I experienced there was a real heaviness in the body. So when the talk was over and you left, I did lying meditation but not for very long. And it went away immediately. It was like the mind had discovered the process out of it. Oh, it's just heaviness. It's not—"

You know, the mind stopped thinking, "Oh, I've got to go to bed. I'll try another posture—one closest to going to bed." And it worked. Once it became simply heaviness, it no longer was the hindrance.

That's precisely it. The hindrance was something you had carefully constructed out of raw materials such as heaviness, but also resistance and aversion. It's a fascinating example of the constructed nature of experience. We take for granted, "Oh yes, this is X," but when we start to examine it closely, we discover something quite different.

The examination included your decision to go into the lying posture—that was a wise decision. You could allow yourself to experience the heaviness directly, allow the body to feel it fully. It was a suitable posture for investigation. This is what I would call a craft decision: How do I work skillfully with this? One approach is to lie down and create space for exploration.

You set it up in such a way that you could go into the experience and tease it apart, finding its elemental qualities. You focused on the most obvious quality—the heaviness—and deconstructed the whole fabrication. This is essentially what we're doing in practice. What we take to be real is often just a construct. This becomes increasingly evident when working with the mind.

Since time is moving on, let me offer another exploration following from yesterday's discussion: What does thinking feel like? What does it actually feel like to think? I recommend playing with this question if you need something to investigate.

One final reflection on thinking: To me, thinking is essentially the cognitive aspect of the mind. We've discussed vedana, the feeling aspect, and thinking generally covers the cognitive dimension—the knowing aspect, how it works, what it constructs, and how it moves. Using the thought stream as a meditation object provides a gateway into understanding how the mind constructs meaning and how the process of knowing actually functions.

I think it was Jane who mentioned experiencing a knowing that may or may not be turned into words. I find this observation fascinating. I call this "the one more cup of coffee before I go" syndrome. As a dedicated coffee drinker, I notice that the thought "it's time for another cup of coffee" occasionally arises. But when I pay careful attention, I realize there's a moment of instant knowing that precedes any verbalization. The words cement the knowing, but they also cement the one who wants the coffee, embedding that person into the whole situation. Yet the knowing was already present.

When you use thinking as a meditation object, you discover something interesting: you'll think less, but the quality will improve. You begin to realize that, at a conservative estimate, ninety-nine percent of our thinking is a complete waste of time—everybody's time, and especially our own. The half-life of an unattended thought is perhaps twenty nanoseconds.

This reminds me of a recent study where researchers attempted to reproduce three hundred significant psychological studies, and in the vast majority of cases, they couldn't replicate the results. The findings were dubious at best. Perhaps much of our mental commentary deserves similar scrutiny.

Thank you very much for your attention and engagement in this exploration.

CHAPTER 11

Mindfulness, Memory & Wisdom

Patrick Kearney · 1h02

> *Drawing from the Mahāsīhanāda Sutta (MN 12), Patrick Kearney examines the Buddha's teaching on four interconnected mental qualities: mindfulness (sati), retentiveness (gati), memory (dhiti), and lucidity of wisdom (paññā-viyatiya). He explores how sati, rooted in memory (sarati), involves tracking experience over time within an expanded present that includes the depth of past conditioning. Through practical examples—from yoga instruction to his own teaching experiences in Burma—Kearney demonstrates how mindfulness develops through three movements: clearly registering present experience, holding it within context, and maintaining continuity of engagement over time. He emphasizes that true mindfulness practice requires both the noting aspect and dhammavicaya (investigation of phenomena), creating space for wisdom to emerge through recognizing patterns in experience. The talk addresses the balance between analytical understanding and saddhā (faith/confidence), showing how genuine insight practice requires both cognitive precision and heart-based trust, particularly when navigating the challenging aspects of meditation development.*

Tonight I want to speak about mindfulness, memory and wisdom. We're going to explore mindfulness by examining how the Buddha speaks about it, looking specifically at one section from the Mahāsīhanāda Sutta, the greater discourse on the lion's roar.

Let me set the context by reading the beginning of the sutta:

"This is how I heard it. Once the Blessed One was living at Vesali in the grove outside the city to the west. Now at that time, Sunakkhatta, a son of the Licchavis, had recently left this teaching and training. He was speaking to the Vesali assembly: 'The Samana Gotama does not have any accomplishments transcending the human, any distinction in knowledge and vision worthy of cultivated ones. The Samana Gotama teaches a Dhamma hammered out by reason, following his own line of inquiry as it occurs to him.'"

The scene is Vesali, located on the north bank of the Ganga in what is now Bihar state or eastern Uttar Pradesh. Vesali was the capital of the Licchavi Republic, the largest of the old tribal republics that still existed during the Buddha's time. The political landscape then was divided between the new centralizing absolute monarchies and the old tribal republics. The Buddha himself came from one of these old republics, the Sakya Republic.

Sunakkhatta, being a son of the Licchavis, was an upper-class citizen of this republic and a member of the parisa, their parliament. They practiced a form of direct democracy, and he had the right to speak in the assembly. He had recently become disillusioned with the Buddha, decided the whole thing was worthless, and quit. Now, with the Buddha visiting, Sunakkhatta was busily slandering him in the assembly.

Notice how he calls him "the Samana Gotama"—using Gotama, the Buddha's family name, rather than "the Buddha" or "the Blessed One." Samana was the category of practitioners and philosophers that the Buddha belonged to. This form of address marks him as an outsider, rather like saying "Reverend Gotama." His criticism was that the Buddha "does not have any accomplishments transcending the human, any distinction in knowledge and vision worthy of cultivated ones"—in other words, he's not spiritually enlightened. He claims the Buddha "teaches a Dhamma hammered out by reason," suggesting he's merely thought up some theory and is spouting nonsense.

When Sariputta, going through the city, hears about this slander, he reports it to the Buddha. The Buddha then launches into this discourse—a lion's roar, a sīhanāda. A lion's roar is a statement of absolute certainty and conviction: this is the way it is. Here it concerns the Buddha's right to leadership, defending both his enlightenment and his authority as head of what had become a huge international organization—the Sangha and the Buddha Sāsana.

This discourse occurs when the Buddha is already an old man, about eighty years old. In fact, he will die within a year. Sariputta is also elderly and will die before the Buddha. In this conversation between two old men, as the world changes in ways they don't appreciate, the Buddha addresses the subject of mindfulness and its relationship to wisdom, particularly in the context of old age.

The Buddha tells Sariputta: "There are certain samanas and brahmanas"—the two categories of philosophers and practitioners that existed; brahmanas being the hereditary Vedic priesthood and samanas being everyone else—"whose doctrine and view is this: 'As long as this good man is still young, a black-haired young man endowed with the blessing of youth in the prime of life, so long is he perfect in his lucid wisdom. But when he is old, aged, burdened with years, advanced in life and come to the last stage, being eighty, ninety or one hundred years old, then the lucidity of his wisdom is lost.' But it should not be regarded so.

"I am now old, aged, burdened with years, advanced in life and come to the last stage. My years have turned eighty. Now suppose I had four students, each with a lifespan of a hundred years, perfect in mindfulness, retentiveness, memory and lucidity of wisdom. Suppose they continuously asked me about the four establishments of mindfulness and that I answered them when asked."

Suppose they remembered each answer of mine, never asked a secondary question and never paused except to eat, drink, urinate, defecate and rest. Still, the Tathagata's Dharma teachings, his detailed explanations of Dharma and his replies to questions would not end before those four students of mine would be dead at the end of their hundred years. Sariputta, even if you have to carry me about on a bed, still there will be no change in the lucidity of the Tathagata's wisdom.

The Buddha's not taking any nonsense from these ambitious young teachers who think wisdom diminishes with age. He's talking about mindfulness and wisdom, giving this vivid image of four perfect students, each endowed with mindfulness, retentiveness, memory and lucidity of wisdom. They're engaged in conversation about Satipatthana, the very practice we're doing here. The dialogue flows back and forth continuously. Because these are perfect students, the Buddha never has to explain anything twice. They don't need clarification—they understand every answer immediately. So they're moving rapidly through the entire teaching.

The Buddha could speak about this practice for a century and still have more to say. This gives you a sense of the vast depth within this practice of mindfulness.

Let's examine these qualities the Buddha mentions and how they interconnect. First is mindfulness itself—sati, derived from the verb sarati, meaning "to remember." Mindfulness is fundamentally about keeping the present in mind. But what do we mean by "present"? The Buddha isn't speaking of clock time but of experienced time—an expanded present that, in a profound sense, is the only thing there is.

If I look for the past, I cannot find it. I cannot experience the past directly. I cannot experience the future. All I have is this present moment. This is simply the nature of existence.

Yet this present has tremendous depth. It is profoundly shaped by what has preceded it. The present is what it is largely because the past was what it was. Right now we're here together in this present moment—this particular situation unfolding. But why does it exist at all? And why is it precisely as it is?

Each of us has made countless decisions and performed countless actions over many years that have culminated in all of us sitting here together now. This situation is the product of years of choices, decisions and actions by each of us, as well as by the entire network of people who conceived the vision of building a meditation center in the Blue Mountains, who actually built it, and who continue maintaining it to this day.

When you truly look at it, there's this vast network of human interactions converging to create this moment. This present is what it is now largely because of everything that happened in the past. So this present moment contains enormous depth reaching back through time.

The fact that the present is shaped by the past is precisely what makes learning possible. Learning requires time to develop. Each person in this room has cultivated their meditation practice to a certain level. When I experience my practice now, what I encounter is this present event. But this present experience is the fruit of decades of development. It simply could not occur without that foundation.

When we examine cultivating mindfulness, this involves three closely related movements.

The first movement is the most obvious. This present experience—what's happening right now—must be clearly registered. We have to be face-to-face with it, maintaining direct engagement with the present. Of course, the difficulty is that we tend to be seduced by past and future, or by somewhere else, some when else. We keep being drawn away from this immediate reality. So first, we must cultivate the ability to remain present.

Secondly, this present experience must be held within the context that surrounds it. When I'm aware of something, this something exists within a larger field. For example, when I follow my meditation object, this object is part of a wider field of sensation—it doesn't exist in isolation. The knowing of this meditation object is flavored by the mind that knows it, and this mind is in a certain condition which influences the whole experience. The mind knows it in a particular way, so there's both breadth and depth involved. This experience now, whatever it is, is dynamic. It has already transformed into this, having been something else, and is already turning into something else. Nothing stays still; everything is constantly moving. Nothing is finished yet.

Thirdly, recognizing that this present experience moves through time, we realize that to truly understand it, there must be a continuity of engagement. We have to stay with it over a period of time if we are to actually understand it. This is where we en-

counter tracking—anupasana—following experience over time while maintaining continuity of awareness and attention. This is how we develop the skill we've been discussing.

Let me offer an example. Imagine you arrive at your first meditation retreat, wanting to be incredibly spiritual, only to discover that sitting cross-legged and trying to remain upright is incredibly physically painful. You have no time to be spiritual because it hurts too much. This is not an uncommon realization when people begin meditation practice.

So you decide to do something about it and take up yoga. You research carefully and hear about a particular yoga teacher. She's been practicing yoga for thirty years, teaching for fifteen. She has an excellent reputation and runs wonderful classes. You sign up.

You arrive for your very first yoga class. They're doing basic postures. In the middle of class, the teacher says, "Everyone stop." She has a student demonstrate a posture and asks the class, "Take a look at this posture and tell me what you see."

Now imagine you're standing right next to the yoga teacher, with almost exactly the same view. You're both looking at the same person doing the same posture. Are you seeing the same thing? Absolutely not.

Even assuming your eyes function identically, you're not seeing the same thing. It's obvious. The yoga teacher is seeing a tremendous amount that you have absolutely no idea about. Yet you're both in the present, noting exactly the same object—except it's not the same object, or at least not the same experience.

The difference is that you bring twenty minutes of past to this experience, while the yoga teacher brings thirty years of past to this experience. And that makes all the difference.

This reveals an important aspect of mindfulness: mindfulness is memory. It's about our relationship to the past. Mindfulness involves both awareness and retentiveness—what in Pali is called dhāraṇā or gati. These translations come from Bhikkhu Bodhi.

Gati, G-A-T-I, translated as retentiveness, is the capacity to hold something in the mind—to be aware in such a way that a broader picture can emerge.

When we take up meditation practice, one of the things we discover is that much of meditation practice is quite mundane. We could even say tedious. And we tend to grow impatient with it. It's too ordinary.

All afternoon I've been sitting, walking, and it's like: breathe in, breathe out, breathe in, breathe out, step, step, step, step, distraction, step, step, distraction, breathe in, breathe out, distraction, step, step, distraction, breathe in... God Almighty, what is this about?

What it is about—its meaning or any understanding that it contains—is something that emerges at its own pace over time. And so in practice, one of the characteristics that a meditator needs is the capacity to wait. To simply wait until something happens that completes the picture. Ah, this is what it's about. Ah, this is what's happening.

Retentiveness is the capacity to do this, to hold something in the mind until some kind of understanding can emerge. But again, time is central.

And then we have memory—*dhiti*. This is another word for memory. And this is the capacity to bring out from the deep places of the mind what has been previously stored there. Now, memory here implies a response to present experience that brings with it what has been held from the past. In other words, the capacity to apply one's experience to present circumstances.

The example that I like to give is about the first time that I taught in a meditation retreat. This was back in the 80s. I was a monk and not long out of Burma, and I was visiting Wat Suan Mok in southern Thailand. This is Ajahn Buddhadasa's monastery, and they had set up this program where every month they would run a ten-day retreat for foreigners—basically spaced out tourists and hippies.

By this particular retreat, the whole program had developed to the point where they had actually built a meditation center on the other side of the highway from the main monastery. It's a huge thing. As far as I know, they still do it—a ten-day retreat every month is an enormous commitment. And of course the language of instruction was English.

So the monastery was always on the lookout for anyone who was: a) ordained, b) spoke English, and c) within the past decade had been within five kilometers of a meditation center. Because if you had these three qualifications, they grabbed you and they threw you into it and you were a meditation teacher.

So I was conscripted, much to my alarm. And I was given the job of interviewing the meditators. There were at least two of us who were doing this. I remember there were two of us in the same venue. This was the dining hall—this big kind of tropical place with a waist-high concrete wall and then pillars with a thatched roof so the breeze could come through. On the side of the wall there was a concrete ledge which you could

sit on. I was sitting on one side and this rather eccentric German monk was sitting on the other, and we were interviewing. I was very nervous because I'd never done this before.

I was not feeling very happy about it. Anyway, I was hoping no one would turn up, but someone did turn up to sit down. I tried to make friendly conversation, but they just wanted to talk about their meditation. And worse, this fellow wanted to talk about the problems that he'd got in meditation.

So he's telling me about this problem, and I'm sitting there wondering what to do. But it occurs to me: yeah, yeah, that happened to me. And so I say, "Well, yeah, that's familiar, that happened to me. Look, try doing this. It worked for me, it might work for you."

And the fellow looks happy and he goes off. And I think, "Phew, got through that one." But someone else comes. So it goes through the whole process again. I manage to say something because, you know, I'm in... basically, any hole that you can fall into, I've fallen into. So off they go.

And somehow I managed to survive that first round. And I was really relieved.

But the next day I'm back again. And who should turn up? The same person who turned up the day before. And he opens up by saying some of the most fearful and alarming words that any meditation teacher can hear: "I did what you told me." And of course I think, "Oh no, why did you do that?" So I say, "And what happened?" And he says, "It worked." Another relief.

So it goes on, and at some point during this process it occurred to me that I know about meditation. And it took me quite by surprise. Because you know, as a meditator, what do we do when we meditate? We're wrestling with some problem. Something isn't right. So we're kind of wrestling with it. And then we've got that more or less patched up. But by the time we finish congratulating ourselves, there's something else which isn't quite right. So we're kind of patching that one up. We've got to do something else and patch that one up. We've got to do something else and patch that one up. So all the time we feel like we're behind speed. So we're thinking, "Well, I'm not very good at this. If I'm making progress at all, it's incredibly slow."

And what we don't realize is that each time we go through this process, we're learning something. But we're so close to it that we don't recognize it. And it's only later on, when somebody says something like, "Yeah, I was meditating but this terrible thing

happened," that you realize, "Yeah, that happened to me. I was completely stuck there, but I did find a way through and you could try doing this." And you suddenly realize, "I actually know about this."

This is memory in the sense that the Buddha is talking about it. It's not that I'm sitting down and thinking, "Oh, what happened then? Maybe it's in the filing cabinet somewhere." It's just that there's a problem now, and out of apparently nowhere, suddenly, "Ah, I'll try this. This seems to be the right thing to do." And often it is.

So this kind of experience is familiar to anyone who has cultivated a craft. You look at it properly and you know what to do about it. And someone who doesn't know the craft can think, "Wow, that's impressive." But for you it's like, you know, it's no big deal.

And then we come to *pañña-veyatia*, the lucidity of wisdom. So you can see in these previous three, what's been happening is that an understanding has been developing over a period of time. Not quickly, but over a period of time, some kind of understanding has been developed based on the basic practice of mindfulness, which is tracking experience over time.

And then we have *pañña-veyatia*, lucidity of wisdom. Now this involves the capacity to discern the patterns and directions of what's being held in the mind. So it's more than holding data—it's the ability to navigate data, to use it in some way. So something has been experienced, something has been learned, but how well do we know our way around it?

So the Buddha's lucidity of wisdom is shown in this example by his capacity to discuss all the subtle nuances of Satipatthana with these four perfect students for a century and still there's more that he knows. So he knows a complex landscape in all of its detail. And he knows how to move around.

So, for example, let's say that we're living in the big city and we join a group or an organization that meets once a week in the evening. And let's assume that these meetings take place in a part of the city that we have never been to or rarely visit. And we're a bit concerned about how we're going to find our way there on the first meeting. But fortunately, a friend rings us up and says, "Look, I'm going there too. Don't worry about it. I'll drive you. I'll pick you up at your place and I'll take you there." So at the time allotted, car pulls up, step into the front passenger seat, off you go. And he takes you there.

Now let's assume another scenario, exactly the same, except just as you're leaving, your friend says, "I can drive you there this week, tonight, but over the next few weeks I'll be away and I won't be able to drive you again. You're going to have to make your own way there." And you say, "OK, no problem," and off you go. Now in both cases,

you're sitting in the front passenger seat, being driven through the city to a particular destination. In both cases, you're seeing exactly the same landscape. Is there a difference in the quality of your awareness in the two circumstances? Yes.

In the first instance, it's simply seeing. You are present—right now I can see this, right now I can see that. You are in present moment experience.

In the second instance, you are certainly in present moment experience, but something else is happening. You're not just undergoing a series of events, but placing each one into a wider context, a wider landscape. If you didn't do this—let's say your friend was taken by surprise and thought he could drive you next week, but it turns out he can't, so suddenly you're driving there yourself—the experience might be something like: "Now here, I know we turned here, but did we turn left or right? Ah, that pub—I recognize the pub, but was it early in the journey or late? And that petrol station, that looks familiar, but did I see it on the left side or the right side?" There would be general confusion. Maybe you'd get there, but if you're tracking that journey, then you're looking at each event as part of a broader landscape, mapping something out as you go. You're creating meaning out of each experienced event by seeing how it fits into a broader pattern.

And this is the action of mindfulness. This is what mindfulness is all about. It's not just awareness—it's awareness over time, in the context of remembering the pattern of events, how things flow, how things fit together.

This is why there's an association between mindfulness and wisdom. Satipatthana, the cultivation of mindfulness, the establishments of mindfulness, is a wisdom practice. Often, instead of satipatthana, people will say insight meditation. Sometimes people say mindfulness meditation, sometimes insight meditation, and sometimes they get confused between the two. But this is why there's a close association between mindfulness on the one hand and wisdom on the other. It's because of its relationship to time and the activity of tracking experience over time so that patterns start to emerge.

Mindfulness—the job of being mindful—is not just being aware, but being aware in such a way that wisdom can emerge.

This is why, for example, I talked earlier about the relationship to distraction. I suddenly realize I'm distracted, and it can be useful at that point to look back. What happened? Just to check, to see if I can see it. Now I don't spend time thinking about it—if I have to think about it, it's not there. But I might just look there and recognize, "Oh, that happened." And so it's like seeing a pattern. In this instance, this arose because of

that. The next time something happens and I recognize I'm distracted, what's that? It might be the same thing, it might be something different. But I'm checking for the pattern.

As we go through this retreat, we are interested in the patterns—for example, asking the question: What's feeding this? This has been happening, but what's feeding it? Or what does this feed? There's an interest, a curiosity involved. How does all this unfold? How does it work?

The use of questions can be useful. When we ask a question of our experience, we don't think about it. If I have to think about it, it's completely useless. The question directs awareness.

Secondly, if I ask a question in the course of practice, the answer is completely irrelevant. What's important is the question. If it's a good question, it will stimulate something. Something will happen, something will become clear. The answer is just blah blah blah. But I can ask a question of my experience and then see something directly because the question aims awareness.

What we're talking about here is investigation, the second of the factors of awakening: dhammavicaya, investigation of phenomena. The way I see it, mindfulness has this very direct, earthy quality to it. It's like knocking on a door.

Bang, bang, bang, bang, bang, bang.

Each time I note, it's like bang, bang, bang. Let's say I'm going to visit someone and I have reason to be certain that they're at home. I knock on the door—bang, bang, bang, bang. But nothing happens. Just over there is a window. So I step across to the window and have a look inside. I can't see them, but I know they're in there somewhere. And so I keep looking in the appropriate direction.

The knocking on the door is like noting an object. There's a clear object—this is what I'm after. Looking through the window, the object isn't there, but I know there's something there. And so there's a direction to my awareness. This first one is like mindfulness and the second one is like investigation. Sometimes the mindfulness predominates and sometimes the investigation predominates, but they're both part of the scene.

If we have the mindfulness without the investigation, then we might become very mindful in the sense that we can creep about incredibly slowly and impress all our friends. We might develop very good concentration, but we don't necessarily get any wisdom. There are people who manage to do this practice for considerable periods of

time and don't seem to develop much in the way of wisdom. Maybe it's because the investigation factor is weak—the interest in and concern with the patterns of experience is not really there.

When we do this practice, we are learning to navigate our way through a landscape: the landscape of our own experience. We're learning to understand how all this fits together, how it works.

This first of all requires time. We have to give ourselves the time to acquire a skill. So don't be upset by failure. Of course there will be failure. Our old habits will reassert themselves again and again and again. But that's irrelevant.

I read in one dharma journal somebody's brief article, and I remember one bit from it. The writer said, "One of the basic qualifications for a person to learn how to meditate is the willingness to live with failure." I think this is profoundly true. For any new student who walks in the door, I think they should be questioned: Are you willing to live with failure? Because if you're not, you're wasting your time.

This willingness to live with failure—in other words, the willingness to keep at it over a period of time and give it the time for something to emerge—means slowly, gradually learning the craft. That involves applying a certain intelligence to the whole enterprise. There's also a degree of creativity involved in the practice. It's not just mechanically noting a meditation object that has been given to us by someone else. There's more to it than that.

By historical and cultural accident, I learned this practice in Burma. Burma is a very traditional and authoritarian culture in which obedience... I used to subversively think when I was at Mahasi Center that the two pillars of the Theravada are blind faith and mindless obedience. These are the two fundamental pillars of the most terrible of all the vadas: the Theravada.

They would agree with you. They would agree. That's the point. That's exactly right. As was explained to me, one of the signs of a good student is a good student never asks questions. I was told that when I visited a lay abhidhamma study group. It was interesting.

The mind state in the monasteries is medieval. The Sayadaw is up on the throne. What he's teaching you is what's in the books. You can check because the books are right there. And therefore it's the Buddha. And so that's it.

"Just believe it and do what I tell you. And no correspondence will be entered into." I remember one talk Upandita gave us. He was speaking to a room full of people who he had reason to believe would mostly end up being dharma teachers. And he was saying, "Look, you have come from other countries to Burma to learn how to meditate. You have come from other faiths, other traditions. And because you are bright and questioning and you have investigative minds, you have seen through the delusions of these false views that you were raised in. And as a result, here you are in this room listening to the Buddha Dharma. Now you can drop all that because what I'm telling you is the Buddha's teaching and you just bloody believe it." He didn't say bloody, but that was the message. No more investigation. No more thinking. No more asking questions. You've arrived at the truth—just believe what I tell you. That's the attitude.

The odd thing was that in the midst of all this dogmatism, the actual practice that he taught was a completely open inquiry. It was astonishing how he could manage to somehow hold these together, but he did and he does. The practice itself is a completely open inquiry into the nature of experience, but at the level of concept the whole thing is totally shut down. In this culture that doesn't work.

And if we try to do it—and some people do because they're full of faith—it just gets locked down. You can get a whole series of nice meditation experiences, but really that's it. Life doesn't transform the way it's supposed to. This practice is designed to stimulate wisdom, understanding. So it requires this sense of investigation, play, creativity.

The weakness in our culture, of course, as Upandita also pointed out, is the absence of saddha—inadequately translated as faith. We, as a culture, tend to come to the practice overly cognitively and with an unwillingness to trust, an unwillingness to trust the Dhamma or the Buddha. And this really is a handicap. And it slows us down.

Both are important: saddha and paññā, faith and wisdom. We might talk about these later in the retreat. But in terms of the way that we actually learn the method, it's not about reproducing someone else's instructions. It's about taking the instructions and making them our own and finding a way to use them to investigate and navigate this whole inner landscape of our experience and get to know how it works—what it does, how it moves, the patterns of it, the rhythms of it. And this is the wisdom aspect of the practice. And as you can see, it's closely associated with mindfulness.

Faith is the heart aspect. It has to do, for example, with the commitment, the passion, the ardency. And it has to do with the opening up of the whole field of vedanā as well, to me. And it also has to do with the opening to possibility. The universe is a lot bigger than anything I think it to be. And the willingness to open up to different possibilities is an aspect of saddha.

One way of looking at it, a very traditional way of looking at it, is: once you get a sense of the Buddha then you recognize he actually knows more about what's going on than I do. So I think I'll trust his opinion on the matter. I won't necessarily believe it, but I will certainly trust him. I would want to find out for myself, but I would be willing to step out in that direction if he recommends it to be a good direction.

Which obviously increases as your practice develops and you see the Buddhist teaching. So you get a confirmation system going. You first recognize, particularly in this culture, first comes... You try it out for perhaps cognitive reasons. That is to say, mindfulness is popular, psychologists like it—how could the psychologists be wrong? So you give it a go, and you're prepared to give it a go. And then perhaps quite quickly you recognize, "Oh yes, something's happening. This has a real possibility," or it's already helped.

And so you have that little amount of saddha and then you take another step forward and it works, and so the wisdom develops and the saddha develops so that they relate to each other. And I think at some point there is a click, there's a shift in which the saddha extends beyond the wisdom. There's a willingness to trust which involves a willingness to leap into the completely unknown.

There are some people who seem to maintain a cognitive relationship to it. And this is always like a balance sheet: this amount of effort, this amount of investment—what result will I get from it?

And at some point, I think basically progress stops. It's like you can get so far with that kind of attitude, but then that's it. At some point, you've got to be willing to take the leap if you really want to go further. And you won't take that leap without saddha.

So it suggests the heart has more breadth than the mind - the heart can hold more. I would agree with that. The heart definitely holds more and goes deeper than any cognitive understanding. Cognitive understanding is always just catching up.

I remember one Dharma gathering on the mid-north coast. We used to have these discussion sessions at the end. There were three teachers: Christopher Titmuss, the main teacher; Subhana Vazaghi; and me. One time, the question came from the audience: "Is Buddhism a religion?" Subhana answered first, explaining, "No, no, no, we're

studying the mind." Christopher gave a similar answer. When it was my turn, I said, "Well, I don't know if Buddhism is a religion, but I do know that I speak to Buddha and sometimes he answers." That's how I feel.

Could you expand on that - when you speak to Buddha, he answers?

Sometimes. Mostly he just listens. But sometimes he answers. And when he answers, he always says really good stuff. He's been very helpful over the years.

I'm not sure if I'm tricking myself, but to me there's a close link between the imponderables and faith. Some people are unwilling to go along until rebirth and nirvana and everything is explained perfectly according to how they can currently understand things. Whereas anything I don't understand gets bundled in the imponderable - which in my case is an enormous basket of stuff, not four things but forty million. This mental approach allows faith to continue because it's like, "Yeah, he'll tell me later," or whatever. It may or may not be revealed. Do you agree that's the link between cognitive understanding and faith?

Yes, it's one way of approaching it. It's one way of recognizing the limitations of the cognitive. Sometimes in retreat discussions, it's like a traffic jam where a person is wrestling conceptually with something I've said, which they don't conceptually get, and they just won't let go. Everything jams to a halt because this one person won't let it go until they hear a verbal formula which can be appropriately filed away within their cognitive structure.

When I say, "Look, don't worry, just forget about it. Maybe in five years, maybe in ten years it'll click, maybe not. You don't have to understand it," they respond, "No, that's not good enough. You've got to give me the formula so I can tick the box."

So there's a limit to cognitive understanding. But there is an understanding which goes beyond that, and that understanding is part of saddha. Saddha is not belief - not belief in a doctrine because someone says it's true. It's the heart's recognition of what is true.

It's rather like falling in love. You meet someone and you know this is the right person. Now imagine if you have that experience, but then an appropriately trained psychologist brings you a checklist requiring you to write down the data which supports this radical conclusion. Of course there isn't any. There's no way there could be. It's just impossible.

Saddha represents a different kind of knowing - a knowing through the heart rather than through the head. What we've been talking about tonight, this paññā, paññā-vimutti, the liberation of wisdom, is essentially the cognitive aspect. Saddha is the heart aspect. But when both are mature, they come together. They're like two sides of the same coin.

When we go to those deep places in meditation - I don't know how you respond - but those places are beyond the cognitive, aren't they? Being cognitive doesn't work there. There are no thoughts, no concepts. But if you want to explain it to somebody else, then it becomes cognitive again. We need to be able to drop all that conceptual framework and go, and I think saddha actually carries you there.

And the cognitive is bound up with language. So it's socially necessary. When the Buddha was awakened and he first thought—or it was suggested to him—that he should teach, he didn't want to because he thought there's no way that anybody's going to understand this. There's no way I can put this in words. Absolutely no way.

But he struggled and he found a way. And that's one of the reasons why the tradition reveres him—that he actually managed to do that, so that others can actually get a glimpse of it. But even then, of course, it's not just the words. You structure attention in a certain way. You do a certain practice. And then, ah, that's what he's talking about.

"Isn't that the function of the insight knowledges—to develop faith?"

Yeah, I think that's one function of the insight knowledges. It develops both wisdom and faith. And some—it's like udayabbaya ñāṇa, arising and passing away—faith is very strong there. But of course faith can be challenged in the dukkha ñāṇas.

So if you don't have the faith, if you don't have the saddhā, then you have a much harder time. And in this culture, this is a problem for people who do go through the insight knowledges. In this culture in particular, I think, they lack the degree of saddhā that you would have if you were Burmese.

"Interesting. It's saddhā that gets you through those."

"I've never experienced this dukkha that you speak of."

Let me ask you one simple question. Has it ever been horrible, horrible, horrible? If the answer is yes, you've experienced the dukkha.

"Strangely, when you said before that to meditate one has to have the willingness to live with failure, my hearing aids and my misperception—actually, I heard you say to meditate you need to have the willingness to live with faith. That's what I heard."

Interesting.

"And I translated that as trust and confidence. Because I know what you mean."

I think it's quite true. I mean, that's what you've ended up saying. You've also said that you have to have a willingness to live with failure, of course. But you also said that what drives us—we don't have a conceptual understanding of what nirvana is, and the reason we continue is because we have faith in that. We can see that we have confidence that there's something—there's freedom from suffering. That's why we have the willingness to meditate.

There's also, actually related to this, the problem of secular mindfulness. A lot of the propaganda in favor of mindfulness is all the "hallelujah brethren, this will solve all your problems," and it completely ignores the dukkha aspect.

"Absolutely. And people are in for a rude shock."

Well, they're already—I mean, can I just go off a little bit? They're already doing that now. I'm going to write a paper on it because there's already articles coming out—bad press about mindfulness now—because people are experiencing dukkha ñāṇas. They're experiencing negative side effects. There's "the dark side of mindfulness." Listen to all the articles—"dark side," "bad press." When you pay attention to experiences, what happens?

"Many years ago I was on a ten-day retreat with Sayadaw U Janaka, and this very new yogi asked, 'How does one get enlightened?' And he replied, 'One has to be able to know disappointment.' I thought that just really struck a chord with me."

I was reading through some of the websites and articles on the dark side of insight, checking it out and seeing what they had to say. And it was very obvious that there was a major lack of faith, a major lack of any appreciation of the devotional aspects of Buddhism, a lack of appreciation for things like the brahmavihāras as practice—reverence, faith, those religious-type aspects that I think keep the heart stable and keep the heart open and malleable and soft.

When you are facing dukkha, it's the heart stuff that's described by the Buddha as—is it appamāṇa, immeasurable, boundless? Whereas all the cognitive stuff is never described as boundless. It's always the qualities of the heart that are described as potentially boundless.

So I think that the religious aspect comprises the protective practices that keep you balanced.

The use of the word "religion" opens up a huge minefield. Well, you know, I'm in robes. I don't know how to say it otherwise. We'll grant you that permission.

It's delicate territory to negotiate. But we seem to have wandered off the point. I've forgotten what the point is.

So, thank you very much. Thank you for listening.

CHAPTER 12

Tracking Choice

Patrick Kearney · 52 min

Patrick Kearney explores cetanā (choice or intention) as a meditation object within the framework of the Satipaṭṭhāna practice, focusing on the third foundation of mindfulness - cittānupassanā (contemplation of mind). Drawing from his extensive retreat experience in Burma, he examines how the Buddha's technical terms around choice and intention - including saṅkhāra (formations), sammāsaṅkappa (right aspiration), and adhiṭṭhāna (determination) - all center on the direction we send the mind.

Kearney illustrates these concepts through vivid stories from Burmese meditation centers, including the intense practice of noting intentions in walking meditation and the extraordinary determination practices he encountered. He explains how cetanā differs from our conventional understanding of intention, operating at much deeper levels of consciousness and manifesting as pre-verbal impulses and micro-decisions that construct our lives moment by moment.

The talk offers practical guidance for tracking choice as it arises in meditation - whether as physical or mental impulses, decisions between possibilities, or the subtle intention to think. Kearney emphasizes that even unsuccessful attempts to catch intentions serve to refine our aim and precision of awareness. He connects this microscopic level of sammāsaṅkappa (right aim in meditation) to the macroscopic choices that determine our life's direction, showing how understanding the arising of choice reveals the full range of possibilities available in each moment and opens the door to genuine freedom.

We've been going through the four Satipatthanas. We talked at first about the body, with different exercises there. Then we explored briefly with vedana, with feeling. Now we've started on citta. Yesterday we used thinking as meditation object. Thinking is normally used as a secondary object when it becomes a distraction. Not many people use it as a primary object, as a grounding object, although some do. They are unusual.

When we talked about vedana, we discussed this whole elemental realm of affect from which comes what we do, the movements of the heart. We also talked about the role of cetana—choice, decision, intention. Today we're going to speak more about tracking choice or intention as a meditation object, as an important part of the citta.

First, a bit of background. The Buddha has a number of technical terms that center around the concept of choice or intention or decision. All of them are about the direction that we send the mind in. We've already spoken about the way the Buddha uses the image of the path. That's obviously quite important to him.

Every path has two characteristics. One is someone has been there before. You can't have a path unless someone's already been there. So path implies a tradition going back into the past. One image the Buddha uses is the story of someone who's off in the bush and discovers an ancient path—overgrown, unused for a long time but obviously once used. So he follows this path and discovers this abandoned city, then goes back and recommends to the king that they clear up the path and restore the city. The abandoned city is Nibbana and the ancient path long forgotten is the path rediscovered by the Buddha.

So path has this sense of someone else having been here before. But equally, as that story points out, path has direction. A path leads somewhere. This sense of direction is really crucial for the Buddha.

You have terms which revolve around this sense of direction. For example, sankhara, particularly in the five aggregates, the khandhas, the five bundles. Sankharakkhandha represents the stream of impulses, desires, fears, and so on that flow through the mind—the stream of choices or intentions, what we are moved to do at any particular time. They're called constructions or formations because these are the main constructive or formative influences in our lives.

When we look back as adults, we can see that what we've been doing is constructing a life—this life that each of us is living. We've been working on it for a long time. We might not be particularly pleased with the end result, or we might be very pleased with the end result, but in either case, what we've got is something that we've been working on for a long period of time. We've been working on it through the choices that we've been making. These choices are sankharas, constructions, because they construct our lives.

In the Eightfold Path, the second factor is sammasankappa. Sometimes this is translated as right thought—traditionally the most common translation in the older translations. It could be translated as right intention, could be translated as right aim. I translate it as right aspiration. There's no exact English equivalent, but in every case it refers to the direction in which we send the mind.

In a broader sense, particularly if you look at the major decisions that we make in our lives, we send the mind in a certain direction. This is what I'm going to do. This is where the heart and the mind are headed for.

So I go through school and come to a decision that I'm going to go to university, and then I'm faced with a fundamental choice. I could study something totally useless and pointless like economics or law or business, or I could study Buddha Dharma. Which one will I do? Depending on which decision one makes, one heads off in a certain direction. That direction will have a lot of influence. I choose a particular career stream, let's say, and then I have a particular group of friends and associates.

I have a particular group of elders, seniors, teachers, and bosses. I discover there are certain things I should learn, other things I should simply keep up with and know about. There are certain kinds of conversations I will have with these people, certain fashions that I will quickly hear about, certain things that I discover are approved of or disapproved of, encouraged or discouraged. My life starts to be shaped in a certain way.

Alternatively, if I make the wise decision and study Buddha—though there isn't much opportunity in Australia to study Buddha at universities—then my life will be formed in a different way. And in the process, I will become a different person.

Then you get another term: *adhitthana*. Anybody who's done Goenka knows all about *adhitthana*. This is resolution or determination. This is a deliberately created, even forcefully created intention, choice, or direction—a determination. In terms of meditation practice, perhaps force is the wrong word. So I might make a determination: "I'm going to sit for an hour without moving." That's a determination, though it's not really forceful. If it's forceful, it's definitely not going to work. But a determination, a resolution: "I'm going to do this."

The most famous one is the Bodhisattva's resolution just before he sat down at the Bodhi tree: "Let flesh and blood dry up. May only bones and sinews remain. I will not move until I have attained my goal." When I think of that and I look around at the meditators... I shake my head. Life is full of contradictions.

In Burma, as I said, there are heaps of different methods. I discovered one of them when I was practicing at Mahasi, which is Sayadaw U Janaka's place just north of Rangoon, not far from the main highway. At some point the place was visited by a group of people from a neighboring meditation center just up the road, and I was invited to go and visit. So we piled into a taxi and headed north up the highway, then turned off to the left.

There was this enormous place—it was huge. At that time of year, it was largely deserted. Apparently it's full to bursting during the *vassa*, the rainy season retreat. Looking around, the kinds of people who were there were quite different from the kinds of people you see at Mahasi centers. At Mahasi centers you see middle class and upper class people. In this place, there were more lower class, working class, peasant-type people.

The practice there—this place was founded by an arahant who in the early 20th century was a local bandit. He used to go around robbing people, and his wife got concerned because she thought that he was going to head for a very bad rebirth. So she tried to convert him to religion.

The way that she did it was through a connection to a famous teacher called Sun Lun Sayadaw. He was a farmer who got religion. The only meditation instruction he got was from a fellow villager who had been to a retreat, who said, "Oh, you just note body sensation." So this farmer decided, "Right, body sensation, that's it." Complete *adhitthana*—he just noted body sensation all the time and started developing concentration. But feeling he had to go further, he dropped out from being a farmer and went into the forest and just sat. He would sit for hours, days, just noting body sensation.

If you ever try it, apparently it's a very good meditation object. What you do, if you want to try it today—let's say as soon as this talk is over, until lunch—just sit completely still. At some point body sensation will become strong, and it becomes a good object. So this is the method.

This Sun Lun was what we would call middle class, but not highly educated. He drew his audience from that class and taught in a very simple way. One of the ways in which he taught was by creating cartoon books—graphic novel-type things with lots of pictures and captions on how to do this meditation practice, so that people who weren't particularly literate could read it, and certainly not intellectual.

Anyway, the bandit's wife gets one of these comic books and she says to her wayward husband, "You really should take up meditation practice. Here's how."

He gives him the book. And he looks at the book. Now this guy is completely illiterate—he cannot read the captions. But he can look at the pictures. So he studies the pictures, works out the meditation method, and starts doing it.

Pretty soon he's abandoned being a bandit. He's also abandoned his wife. And he's living in the local cemetery, sitting on a grave. What he would do is generate a bit of samadhi by forced breathing—hyperventilation—and then just sit for hours or days at a time.

In the local area, people begin to notice that the bandit is no longer banditing. People begin to gossip: where is he? And it turns out that he's sitting for hours or days at a time on top of a tombstone in the local cemetery. Now, in any civilized society, what would you do? You'd call the police or you'd call the local mental health team. But what do they do? They go and feed him and look after him.

After two years of this, he's an arahant—fully awakened. So he creates this meditation center.

If you go to this place, the first thing you do is sit down and start hyperventilating. If you want a decent bit of concentration, you do it for a couple of hours at least. Then you drop it and just go into whatever's left—body sensation. If you want a halfway reasonable sit, it'll be a twelve-hour session. To go into the hall and come out after three hours—that's pretty wimpy. You're obviously not serious.

Now, if at the end of twenty-four hours you haven't moved—because you're being monitored—people will come and feed you water. Particularly if you're there for several days, you'll be washed and hydrated and looked after. So you don't have to worry while you're sitting. This is intensity sitting.

I went into the hall on a normal, quiet day. They have these enormous loudspeakers, and they play dharma talks from this original founder, which I couldn't understand because it's all in Burmese. But what you'd associate with listening to a dharma talk would be something like gentle instruction about peace and calm. But the sound coming out of these loudspeakers was shouting: "You've got to sit there! Don't move! Hold on! Keep going!" The loudspeakers are made of metal—really tinny.

Apparently this is hugely popular. But to do it, you have to be incredibly physically tough. And looking around, these people are. People who spend their lives working in the fields—they are tough. We're pathetic physically in comparison. "It hurts a little bit"—that's the standard attitude of the Australian meditator—but there's none of that nonsense there.

This is adhitthana. This hyperventilation is yoga—it's pranayama—and it is very effective for settling the mind. It's fantastic, if you could do it. But it didn't take long for me to figure out that this wasn't for me. And in fact, it wasn't for foreigners.

They had only had one foreigner who had actually practiced there. They were hunting for others. That's why they were interested in me. I said, "You've got the wrong person."

Let me ask you something: has anybody other than the original enlightened master of that tradition ever been enlightened since? I presume so—I don't know. I mean, there are lots of enlightened people in Burma.

To clarify what hyperventilation is: it's deep breathing, deep and fast, getting the diaphragm going like a bellows. "How come you don't faint?" someone asks. Well, you can faint. Some people do, but what usually happens first is you get tingling in the face, or trembling. If you want to experiment with this, I advise you to do it in your rooms—so if someone doesn't come out of their room for a couple of days, well... *laughter*

So this is adhiṭṭhāna. But again, it's about setting a direction and putting energy behind it.

Finally, we get to the word cetanā, the most commonly used one, usually translated as "intention." I prefer to translate it as "choice."

I don't like the translation "intention"—I think it's far too weak. In English, if you say "intention," it's coherent to say that one can act against one's intentions. We have the saying "the road to hell is paved with good intentions." In our cultural context, that makes perfect sense. But in a Buddhist cultural context, it's incoherent. If hell's over there and you're going in that direction... what? It just doesn't match.

Intention seems too general for me. Choice is specific. For example, I come down here and enter this room with the intention of giving a good talk—but choice is specific. Right now I choose this word. Right now I choose that word. Right now I choose to cut off this completely irrelevant conversation about hyperventilation and change the subject! *laughter*

So intention can be very broad, but choice is quite specific. What the Buddha is talking about is something much more specific rather than broad.

"Patrick, in English they have the word 'volition.' What's the difference between intention and volition?"

Volition would fit too with cetanā. Sometimes you see it. Saṅkhāra, as the fourth aggregate, is sometimes translated as volition or volitional formations. So volition would also work—it means will, voluntary action.

Voluntary, yeah. Same root, I presume, as voluntary.

So for the Buddha, chetana goes very, very deep. That's another difference between our sense of intention and the Buddha's sense of chetana. Intention goes to a certain depth and then it stops. But for the Buddha, intention goes really, really deep.

For example, the intention to think. Some people, when they meditate, are bothered by thinking. In fact, they would go so far as to say, "If only I could stop thinking, then I could meditate."

If you become a Dharma teacher and you simply point out to them, "All you have to do to stop thinking is to decide not to," what you would be telling them is the truth. Are they likely to be happy with that? No. They'd probably get angry with you. "What are you talking about? I'm not choosing to think. It's happening to me. I don't want to think. My volition is not to think. My determination is not to think. What the hell are you saying to me?"

Well, I wouldn't quite put it that way. But the fact is that if a thought arises, it's because there's been a choice to think. Now, depending on what you mean by thought, when we're playing with thought, people are saying mental contents arise, images arise, cognitions arise. These appear to arise spontaneously, but we go in and grab one of those and we turn it into something. That is a stream of choices. As soon as we choose, as soon as we drop the choice, the thinking stops.

Was there an intention at the very birthplace of the thought, or just sort of after the proto-thought? That would be a very interesting thing to look at. As far as I can see, the mind simply throws up. That's anatta, right? That's often given as an illustration of anatta—not-self. The arising of... the birth of it. Somebody said, "If it wasn't anatta, why would I be thinking all this stuff? I wouldn't be thinking, you know, 99%..."

But that's the other thing which people find very weird about the Buddha's teaching about choice: choice itself is anatta. It arises through conditions. There's no one choosing. This is why some people will insist there is no such thing as free will in Buddhism—because what they're saying is there's no such thing as someone who has a will which is free or otherwise.

But there is choice in the Buddha's teaching, and this choice goes extremely deep, much deeper than we would normally think it goes. But it too is just another conditioned phenomenon. It comes and goes depending upon conditions.

You can see it, for example, in addiction. If someone is caught up in an addiction and then you give them helpful advice—"Why don't you just stop? Just say no"—then this advice might not be seen as helpful, because from the subjective point of view, "I'm not choosing this; this is choosing me. I'm under the grip of something."

But in fact, it is a choice, because otherwise it would be impossible for anyone ever to overcome an addiction. But people do. Circumstances reach the point where the person decides, "That's it, I'm not doing this anymore." It may have to be extreme circumstances for the conditions in which that choice can arise, but ultimately that's what it is. It's a choice.

That choice has to be cultivated. If you're recovering from an addiction, you can feel each day that you've got to make the choice again, and again, and again, and again. The choice sets direction—your life will head in a certain direction because you're making these particular choices.

So the Buddha says, *cetanā* is *kamma*. Choice is action. The Buddha has a particular interest in this aspect of the heart-mind's activity because when we talk about *cetanā*, we're talking about that part of our experience that we can do something about. That's why it's so absolutely central.

Someone might ask: The choice of the addict—that's an act of will. It seems like an oxymoron to say that choice is a product of dependent origination. It seems so deterministic. How can you have choice if you have this process of dependent origination? Isn't it an act of free will to reject one's dependency?

This is why the radical nature of the teaching of dependent arising strikes us as so strange from our cultural perspective. We think, "How can that be?" But for the Buddha, *cetanā* is like anything else—dependently arisen.

In your sense of cause, you seem to have a model where one thing determines the result—what Aristotle calls the efficient cause. In Western philosophy, that's usually how cause is understood. But notice how in the Buddha's teachings, people often talk about causes and conditions. The Buddha has a broader sense of cause.

The basic model is found in this little two-line verse that appears again and again:

"When this is, that is.
From the arising of this, that arises.
When this is not, that is not.
From the cessation of this, that ceases."

That's his teaching in a nutshell. It's about this and that—one phenomenon, another phenomenon. When this is, that is. When this is not, that is not. That's not causation in the European cultural sense. That's association.

Let me give you an example based on a story someone told me years ago when I was doing my PhD at the University of Queensland. A friend spent time on Stradbroke Island with the traditional owners. One day they were sitting around, and out of the blue, one of the young men said, "We should go fishing tomorrow because such-and-such fish will be biting off the north head."

My friend had the presence of mind to ask, "How do you know?"

The guy looked at him as if he was a complete idiot and said, "Didn't you see that flock of birds flying south just now?"

"Yeah, so?"

"Well, at this time of year, when those birds are flying south, those fish will be biting off the northeast head."

He's not saying that the birds flying south causes the fish to be off the northeast head. But where you have this, you have that. When this is, that is. When this is not, that is not. This is what we would call association, but for the Buddha it was part of dependent arising.

And he says, "From the arising of this, that arises. From the cessation of this, that ceases." That's more cause in our normal sense.

For the Buddha, everything is subject to this except the unconditioned—*nibbāna* itself. And that includes *cetanā*. There's always something associated with *cetanā*. For this choice to be made, there has to be something else happening that supports the arising of this.

If I want to change this, then I change that. If I can change that in a certain way, this will not arise. So no matter what it is—I'm in the grip of an addiction and I decide, "I think I'll just have one more." Now that decision is accompanied by a lot of other conditions.

Another principle of this is there is no single cause and no single result. They don't exist. You get a whole complex bundle of causes and conditions, and the result is a whole complex bundle of results. So nothing is alone. That decision was supported by a whole series of accompanying circumstances. If I can chase the right thing in that bundle, then the decision will be, "I think I won't have another one." That's the way it works.

There's a whole different way of coming at it. It's got a lot to do about the relation with time too, because the Western mind seems serial. While this associative thing is a broad spectrum, a sort of matrix of things. So you get conditional relationships which require time, which are diachronic, and you also get causal relationships which are synchronic.

For example, when we talked about vedana, where you have contact, you have feeling—it's not that feeling comes along later. So that's a synchronic relationship, not a diachronic relationship. Whereas you might talk about if you're a good little meditator, you'll be reborn in heaven. That's a diachronic relationship. It requires time. Both forms of relationship work, including in the Patthana where the result comes first and the cause comes later.

It seems to me the very first power factor has a lot to do with the causality of choices, which is the view—right view, wrong view. And your view, not in the small, but the broad—your worldview, the matrix of conceptual frameworks that you're in—is very much the causal condition for choices. And as you get more information from Dhamma talks or from people around you, then that changes, your view changes, and then the choices that can be made arising from it change.

I don't think it's an accident that samma sankappa and samma ditthi are linked. So cetana, choice. So getting to know it from a meditator's point of view is very important—becoming sensitive to the arising of choice or intention. Thanissaro translates cetana as decision: "the decision to act," which I think is quite good.

If you're looking for it as a meditator, how does it present? How do you know that you find it? Actually, if you do the classic Mahasi method, then noting intention is an important part, and they usually present it in walking meditation first on the grounds that it's easier to find in the walking.

I have to confess that when I went through this classic Mahasi training, this is part of the training that I found incredibly frustrating because I could never find intention. Just never found it. And it was really embarrassing.

In Burma when you go for your interview, it's kind of lined up and it's very assembly line. So you listen to the people who are just in front of you. You get to know several people's practice because you're in the room at the same time. Sayadaw U Janaka really used to emphasize intention. Part of the questioning in every interview would be, "And are you getting intention in the walking?"

And the meditator would say, "Yes."

And Sayadaw would nod in satisfaction.

"Next, are you getting intention in the walking?"

"Yes, very good."

"Next, to me, are you getting intention in the walking?"

"No."

"Please, try harder."

I just never got it.

There was one time when I was doing walking meditation early in the morning before breakfast. And suddenly and completely spontaneously—I wasn't looking for it—there it was.

I was walking down the hall and there was this cascade of intentions. It wasn't one per step—nothing so gross, nothing so crude. It was this flow, like a waterfall of little golden intentions. Hallelujah! And it just flowed down, flowed back up again. And it's never happened again. Not once.

I could find intention in the mind. So I've had to work on intention because it's always been so obscure to me.

How does it present? To me it presents in either two ways. It can present as an impulse—either physical or mental, so either impelled by body or impelled by mind. For example, the impulse to scratch, the impulse to look at something, the impulse to reach for something, the impulse to listen to something. This morning when I came out into the staff room for breakfast, I won't mention names, but I did hear voices from people who are apparently meditators speaking. And so there was an impulse to listen. The impulse to think.

So it can present as an impulse, or sometimes it presents as a decision between possibilities. There's a moment in which, well, I could do this or I could do that, and I'll go for that one. You might see it, for example, when you're meditating and you suddenly realize you're thinking. I could keep this going or I could go back to the meditation object. I'll keep going. It's right in front of you. Suddenly there are these different possibilities and I'll take that one. It's over in a nanosecond but it can be quite clear.

Kim, are you raising your arm for a purpose? Or not? I could embarrass myself for heaping on more seconds. I'll just check and see if anyone's looking. And of course they are. I find that everyone's looking at me all the time.

We can see it in changes in body posture. Let's say I'm doing walking meditation and I'm standing at the beginning of the path, and I'm about to move. How do I know I'm about to move? Or I'm coming to the end of the path and I'm about to stop. How do I know I'm about to stop?

You can see it in terms of changes of body posture. One obvious way to do it is when the posture hurts and you decide, I want to move to get comfortable. This is where an adhiṭṭhāna might be useful. You could set an adhiṭṭhāna, a determination: I will not move. And then that makes the impulse to move really clear. And then you can just—ah, there it is. Of course, at some point you move, but getting to know that impulse and the decision is useful.

In the walking, it may be easier in the non-routine movements, like stopping, turning, starting, and also in the distractions.

"What was that?"

"Patrick, in the example you gave when you were doing the walk and you had all those intentions arise for you, like a cascade of them. What were some of the other ones other than lifting, placing?"

"Well, there was no conceptualization like that. That kind of conceptualization would have been too crude."

"Or the pre-verbal impulse?"

"Yes, pre-verbal."

"You said there was a cascade of them. I'm just wondering what some of the others might have been."

"No, just movements."

It's like every little bit of the movement was accompanied by its own intention. It was like walking through water. It's quite strange. But it wasn't me doing it, it just happened.

You can see it in distraction. The mind is clear and it's on the meditation object. Now because it's on the meditation object there is a whole series of choices to keep it there. And then suddenly the mind decides to go off into habitual thought or habitual anything. At some point you get that impulse, and that's the manifestation of the choices. So to have a look at that impulse.

One way of playing with it, if you're doing it in the walking meditation, is you've got your track standing at one end, and you make the adhitthana, the resolution: from here to the end of this track, I will not think. And then you just walk. Now you may or may not think during this course but if thought arises you're more likely to catch the impulse to think. Another variation would be, if that's too ambitious, from here to the end of this track I will catch the very first arising of thought. And so you catch the moment that it pops up and along with that you might catch that initial impulse to think. At the end of the track you stop and then you reflect on what happened, and you review the experience.

Turn from here to the end of the track, either I will not think or I will catch the moment that thought arises, and then you just meditate normally. But you set yourself up to be alert to the arising of the thought, and so you can catch it very quickly, and you may even catch the intention, the decision to think. And again, this is another way of working with thought. If thought is a problem, it can be very useful not to have the attitude of I'm going to smash it with a hammer and suppress it, but rather I'm going to find the impulse to think.

Some people, the classic way, of course, in the walking meditation is the impulse, the decision to lift the foot, the decision to push the foot forward and the decision to drop the foot. And you notice one of the weird things that can happen is if you're really, really on the intention, you're paralyzed because it doesn't arise. It doesn't like the spotlight. I find that interesting. So if someone's standing completely still for long periods of time, they could be doing standing meditation or they might be tracking the intention to move. You don't quite know. If they've got one foot up in the air, that's a giveaway.

A few games you could play with it. The intention to think I find really interesting. That's an intention I can catch. I can't find the intention to walk, but I can find the intention to think. And this, one of the things that's important about this is it's all about aim.

All of these exercises are exercises in aim. So instead of aiming the awareness at the thought stream, for example, aim at the stream of choices that produce the thought stream. It's this very subtle shift in the aim. Instead of tracking the movement, aim for the stream of choices that produce the movement. Again, it's this shift in aim. Very subtle.

Tracking mind especially, working with the mind, is always a matter of refining aim. So, for example, not the sensation, but the painful tone of the sensation. Or not the painful tone of the sensation but the aversion that arises because of the painful tone.

These are little shifts in aim of the awareness. Not the content of the narrative that the mind is producing but the emotional flavor of the narrative. And again it's just a little shift in aim of pointing the awareness somewhere else.

When you work with aim, for example in tracking choice, even if you fail, you succeed. Because even if you don't find what you're looking for, because you're practicing your aim, your mind is getting more precise. So, for example, and this has been my experience, you might have the intention or the resolution to do walking meditation and to follow the intention to move rather than the movements. I find I don't get the intention to move. I fail. But the movements themselves become a lot clearer because the aim is getting better.

So if you do these, treat them as exercises in aim, and it doesn't matter if you don't hit the target. Your aim is getting better anyway. And as such, it's very useful. So it's always useful to refine your capacity to aim awareness as accurately as possible, especially when you're working with the mind.

That is sammasankappa. Right aim, right aspiration, on the microscopic level. So on the macroscopic level, it's what will I do with my life?

On the microscopic level, it's will I know this or that? Will I send the awareness here or there? So sammasankapa is right... Sankapa is aim or intention, the second path factor. This is Upandita's translation. He was the first one who said this. He said this can be seen as right aim in the context of meditation. It does fit. And again, path, aim, direction—they all fit together.

The Buddha is very strong about this. Sometimes the discussion comes up about obsession with goals, and I pointed out the Buddha doesn't talk much about goals. He talks a lot about setting a direction and aim, and this is part of that. But getting to know one's intentions or choices or decisions and how they come up from the unconscious, how they bubble up, is extremely useful for getting to know oneself and for what one is doing with one's life.

This is all in the area of karma—the choices that I make, the decisions that I make. What conditions my choice to do this? Why is it that I always choose this? What's conditioning it? What's feeding this?

So working with choice or aim is all about uncovering that whole morass and bringing it up, bringing it to light. Once it's uncovered, then there's the possibility of doing something else. The thing about habitual action is that there seems to be no choice because I don't see the choice. But if I see the arena of choice, then there's the possibility of something else.

I think when the Buddha talks about freedom, this is what he's talking about: that in any given situation, in this situation, I have a range of possibilities. There's something I can do about this. But to have that full range of choices, I have to be very clear about what's happening in the depths of the mind. What are the possibilities of choice? What's conditioning my normal choices? What's behind it? What's accompanying it?

Any questions or comments?

Okay. Thank you very much.

CHAPTER 13

The Insight Chorus - Part 1 - Impermanence & Emptiness

Patrick Kearney · 1h07

> *In this first part of examining the insight chorus from the Satipaṭṭhāna Sutta (MN 10), Patrick Kearney unpacks the pivotal verses that appear after each of the four foundations of mindfulness. He explores how the practice evolves from tracking "body as body" internally and externally to perceiving the arising and passing away of phenomena—the fundamental perception of anicca (impermanence). Kearney explains how this represents a crucial foreground-background shift where the meditator begins to see change itself rather than changing objects. The discussion culminates in the profound phrase "atthi kāyo" (there is body), which the Buddha uses to indicate śūnyatā vakrānti—the entry into emptiness. This represents complete intimacy with experience, free from agenda and the sense of a separate self doing the practice. Drawing on the Mahasi method and contemporary scholarship, Kearney demonstrates how insight meditation truly begins only with the perception of impermanence, marking the transition from preliminary serenity practice to genuine vipassanā.*

We've been going through the Satipatthana Sutta, and tonight and tomorrow night we're going to have a look at the chorus of the discourse, which is about insight.

We looked at the opening section, the udesa, the introduction, but if you look at the structure of the whole discourse, it consists of 21 sections, and at each of those sections there's a chorus which is essentially the same. The only difference is that it applies itself to the immediately preceding section. So it's like a song with 21 verses, each one ending in the chorus. Remember, we talked about how this is an oral tradition, so everything is chanted, sung. Think of learning a song with 21 verses and the same chorus. As we pointed out, repetition indicates importance. So if I learn this song and 20 years later I happen to be meditating and music pops into my mind and this song pops up, what am I most likely to remember? It would be the chorus. So this is the central aspect.

The Satipatthana Sutta is a kind of weird one. There's virtually no narrative. All you've got is the Buddha wandering around the Kuru country, and then he gives this discourse. At the end there's a prophecy: basically you do this and you get enlightened. The rest of it is just this series of meditational exercises arranged according to four categories: body, feeling, heart-mind (citta), and phenomena. We're going to have a look at those four later on. And it's very artificial.

According to contemporary scholars, it's likely that in its original form it was briefer. I don't keep up with this stuff these days. I've got Ajahn Sujato's History of Mindfulness, and he does this whole elaborate analysis of the text which looks very interesting, but I haven't studied it yet. The point being that it's quite possible that this discourse was built up over time and it seems to have functioned as a kind of meditation manual.

Let's say you're in an oral tradition, so the only way that you can convey information is through the mouth. And let's say you're part of an organization which is rapidly spreading and is in fact international. The only way you can standardize the teaching is by chanting something, memorizing it, and passing it on, so everybody chants the same thing. So I think that the Satipatthana Sutta would have functioned as a kind of root text meditation manual that people would have memorized, and different people might have added different things to it because they thought this would fit. And then we end up with the version that we've got.

Now here we're going to look at the chorus, which is quite brief. It's, I think, four sentences. The Buddha would do the first appearance, which is all about body. So the first satipatthana, the first practice is tracking body as body, which we've been talking about.

Then the chorus begins, and this is typical: the Buddha is describing what the practitioner does. I think in the psychological world this is known as an operational definition. Something is how you do it. So he's defining the practice in terms of a description of how one does it.

"In this way she lives tracking body as body internally, or she lives tracking body as body externally, or she lives tracking body as body both internally and externally."

So you have the introduction of this idea of internal-external. And what's that about? I think this is a reference to our normal sense of subject-object duality. Our ordinary, normal, taken-for-granted relationship to the world is based on the fundamental assumption that I'm in here and you lot are out there. And so my world is neatly divided into these two parts. There's me here, there's you there.

Now this is not something I have to think about. It's not something that I have to remind myself of. If I'm lining up for a nice lunch I don't have to think about maybe I should grab this first before any of those other buggers get there. It's just built in. It's just inherent. This basic sense of separation and distinction. So there's a sense of a boundary between me in this body and you all and the rest of the world: internal-external.

"In this way she lives tracking body as body internally." So this would be our normal meditation practice where we're following physical sensation, and when I'm doing this I'm not tracking your physical sensation, I'm tracking this physical sensation in here.

"Or she lives tracking body as body externally." How does one track body as body externally? Well, we've got five physical senses: seeing, hearing, smelling, tasting, touching.

So looking at all of them, seeing is generally external—I see out there, I hear out there. We have smelling, tasting, touching, which are much more intimate, yet even they refer to an external world. With touch, I touch this externally. So this is where the mindfulness of body extends outward.

For example, let's say I'm doing walking meditation outside. I'm also seeing what's happening and hearing the sounds. I don't simply exclude that—"No, no, I mustn't see, I mustn't hear, I must just be doing walking meditation." It includes all of that. The meditation object starts to expand, and my relationship to the external world begins to be affected.

We've talked about how when we develop a certain degree of mindfulness, the world appears differently. It appears much fresher than before. A normal, routine sight or sound appears differently.

We've spoken about mindfulness as memory—remembering the present—so it's based on memory. Another mental quality based on memory is perception. In Pali, *saññā*—perception is recognition. When I meet someone, for example, the first thing I do is rapidly assess: have I met this person before? Stranger or not stranger? I sort this out pretty quickly, usually quite quickly. Sometimes I have to think about it, but when I know someone, I just know them.

When a monk enters the interview room, I don't spend the first five minutes staring at him trying to work out what this is. I know. It's just obvious. And again, I'm not thinking about it—it's just recognition. This depends on the past, on memory. So perception and memory are quite similar.

There's a close connection here, because later on, when the tradition asks what gives rise to mindfulness, what stimulates mindfulness, one of the answers is clear perception. This has to do with what we've talked about as the earthy, grounded, direct, face-to-face quality that mindfulness has. It's a direct engagement with the object of experience.

So mindfulness and perception are very similar, but you can see the difference: perception is stale. I've been here before. I've met this person before. I know who this person is. I can anticipate what this person will do or say because I know them. There's a staleness in the encounter. It may even be that I'm not really paying attention to the situation because I already know.

Have you ever had the frustrating experience where you're talking to someone and explaining something to them, and you can see their eyes glaze over and they switch off because they've decided they know what you're trying to say? But they actually haven't. They don't know. But it takes a lot of effort to actually break through that wall of determined resistance: "No, I'm not going to hear what you're saying because in my mind, I've already categorized it."

One example I came across, which I've always remembered: Many years ago, I was traveling in India around the holy places, accompanying a French Buddhist monk who had spent years in Thailand. He was dressed all in Thai robes, behaving very Thai—*phak Thai bhikkhu*—and spoke fluent Thai. We used to stay at the Thai monasteries at the different holy places, and of course he would do the talking because he was the one who would get us in.

At one of the monasteries, the old abbot came out to see these visitors. This French monk starts speaking to him in Thai. The abbot begins with a few halting words in English: "Who are you?" or whatever. And this guy is responding in fluent Thai. The abbot's going, "What? What?"

What's that? What?" and really concentrated, trying to work out what this guy is saying. He just can't get a word. I mean, it must be his bizarre French accent when he's speaking Thai that he can't figure out a single word. It took this abbot several minutes and a lot of effort on the part of this monk before it finally dawned on the abbot: this guy is speaking Thai, and I can understand every word that he's saying.

This is perception, and it has tremendous power and this quality of staleness. Mindfulness is also a form of perception, but it's characterized by freshness. That this encounter, which I remember, is new. It's quite paradoxical. I remember it, but it's completely new. I've never been here before. And this encounter is entirely new. I've never been here before.

So we have this sense of recognition of the world based on this division, this subject-object division, which is built into our perception. And as the mindfulness develops, this begins to be subverted. I'm not simply mindful of what's going on in here; I'm mindful of what's going on out there. And the whole sense of this inner and outer world that I previously had starts to crumble, and something else is going on.

Basically, the sense of an absolute boundary between inner and outer, self and other, starts to fade, starts to crumble. And with it, the power of our sense of being a completely separate self begins to fade.

It comes out in different ways. Like people who practice together in silence over a period of time—they begin to realize there's a sense of community. There's this sense that I know these people, even though I've barely spoken to them, if at all. But you get a feel for the people.

Also, we start to recognize—we go through pleasure and pain. Let's say we go through our pain, internal, and we can see what we do when we're in that pain. And we might recognize somebody else behaving like that, and we know, oh, I know that. They're in pain. It's the same kind of pain, because they're doing the same sort of thing. And there's this sense of intuitive empathy that starts to develop.

So I begin to realize that the movements of body and mind that I'm tracking are not mine. They're not unique to me. They are, in fact, universal. What is true here is true everywhere. The experience that's happening is not personal. It's just nature. And nature is universal and belongs to everyone.

I think in our culture we tend to resist this one, compared to some Asian cultures—for example, the Burmese. In Burma, when you have the interview, the one-on-one with the teacher, it's very unusual for it to be private. Normally there are other people in the room. For example, you've got other meditators lined up beside you, so it's like an assembly line. So other meditators close to you in the line know exactly what's going on in your practice.

And from our culture, we tend to be uncomfortable with this because it's personal. Therefore it's private. And so here, when you have the interviews, it's always one-on-one, closed room, don't listen, hush-hush. And that kind of fits our culture. That seems to be appropriate.

I remember the mild frisson of shock that I had in Burma when I was going for an interview with the Sayadaw. And in the same room, sitting along the wall, was this family—Mum, Dad, Grandma, kids. And they're all kind of chatting to each other and looking interested. I think, who are they? Obviously they're the audience and I'm here to amuse them.

But they were the family who donated the meal for that day. Now they've just handed over loot to support the foreign meditators and they want to see what kind of return they're getting for their investment, which is perfectly reasonable.

But it's quite clear that for all those Burmese, there's nothing personal in this engagement. At all. It's just what it is. Privacy in Burmese doesn't exist as a word or a concept in the language. Similarly in India and other places. It's like it isn't personal—just what it is.

So we get to see that as the mindfulness develops.

This first line conveys this development beautifully. Then in the next line: "She lives tracking the nature of arising as body, or she lives tracking the nature of ceasing as body, or she lives tracking both the nature of arising and the nature of ceasing as body."

This represents the arising of the perception of impermanence. The perception of impermanence is absolutely fundamental for the Buddha in terms of the development of insight. Insight is always expressed in terms of the three universal characteristics: anicca, dukkha, anatta—impermanence or change, pain and suffering and unsatisfactoriness, and not-self. They're always listed in that order because they progress from gross to subtle.

Of the three, the most obvious is impermanence. Have you noticed that things have changed? If you stopped people in the street and asked them, "Have you noticed that things change?" they'd say, "Oh yeah, things are really different." Everybody knows that things change. It's obvious. Impermanence is the most gross.

If you went up to someone in the street and said, "Have you noticed that you don't actually exist?" they'd probably wonder what you're talking about. It's not at all obvious.

Even the second one—if you asked, "Have you noticed that life contains pain?" they'd probably say, "Yeah, I've noticed that." But if you said, "Have you noticed that all conditioned experiences are dukkha, are unsatisfactory?" they'd probably look at you

strangely and say, "What the hell's wrong with you? A bit pessimistic, aren't you? A bit negative? You must be one of these pessimistic Buddhists. You should get out more. Get a life, go surfing, whatever."

So it's a progression from the obvious to the least obvious, from the gross to the subtle. But the three of them are a package. It's basically the same thing—except it's not a thing—but looked at from different angles.

You find different people have different sensitivities. Some people are particularly sensitive to the perception of impermanence. Some people are particularly sensitive to the perception of dukkha. And some people are particularly sensitive to the perception of not-self.

Anyone care to guess which is the short straw? If you happen to be one of these people who's particularly sensitive to dukkha, you've drawn the samsaric short straw. I know because that's me, basically. I would much prefer to be sensitive to anatta, or even to impermanence.

What would it mean to be sensitive to anatta? Some people just get it without any particular difficulty. Usually they're people who in their normal everyday lives hold themselves quite lightly and are quite adaptable in any situation, playing any sort of role. If they go to the office and they're supposed to be the boss, they walk in and they're the boss. If they go home and they're supposed to be the nurturer, then they're the nurturer. There's no conflict. It's like almost inhabiting different personalities that are appropriate for the occasion. I suspect such people would make good actors.

These would be people who you wouldn't regard as being particularly ego-driven. Not so stubborn people—though not necessarily. There's a whole range of characteristics and personality traits. We're talking in very broad brush terms.

I remember once running a retreat where a couple of the meditators, quite young people...

Although they were very young, had gone through drug addiction and were coming off it. They were using meditation as a support. And it didn't take long to realize that these particular people were acutely sensitive to dukkha. Obviously that's why they got into the drug scene—to get rid of it, push it away.

So these are the three characteristics that constitute the field of insight. Impermanence is always mentioned first, partly because it's, in general terms, the most obvious, but also because there's a sense in which you can do it. You can do impermanence. You cannot do not-self, because the one who's doing it is the self. You could do dukkha, but I

wouldn't recommend it. Some people do it—people with very macho approaches to meditation. "I'm going to sit for three hours and sit through the pain, and I don't care." But this is not necessarily to be recommended. But one can do impermanence.

So previously the Buddha has been saying she lives tracking body as body. And we've talked about how what this is about is cultivating this clear, clean relationship to the experience. This sensation is just this sensation. It's not my thoughts about the sensation. It's not my judgment about it. It's not what I want it to be or don't want it to be. It's just this sensation, full stop—that's it. Just this.

But here the Buddha says she lives tracking the nature of arising as body, the nature of ceasing as body, the nature of arising and ceasing as body. Now what this is talking about is a foreground-background shift. Remember we talked about foreground-background. If I pay attention to something, well first of all, in each of the six sense fields, I'm presented with this field. So let's take the visual field. There's an entire field here. If I pay attention to something—in other words, if I look at something—then that something now occupies the center of the field and the rest of the field is around it. So center, periphery. Now that center can be shifted, so I can look over here—bang, center, periphery. I can look over here—bang, center, periphery, or foreground, background.

Now it doesn't matter where I look, there's always that structure: foreground, background, where the focus is on the foreground. And we've talked about this as constituting the structure of noting. To note something in the language that Mahasi Sayadaw uses does not mean to write something down about it or to name it. It means to be deliberately aware of it, to attend to it, so that that something now occupies the center of the field. And we talked about how this relationship is essentially active. I'm doing this. I'm directing awareness, bang, to this. And then there's the background. And the relationship to the background is receptive. It comes to me. I'm not going to it.

Now, when I do this, and I do it particularly with this practice, as I keep doing it, I notice that my object—we call this the object of awareness or the meditation object—I notice that it changes. In the time that you've been here, has anybody noticed their meditation object changing? Yes? I'll take silence as assent. According to Buddha's custom, when he remained silent, he was agreeing.

So we tend to notice that the object of awareness changes. If you're practicing a method that is designed to generate insight, you will be encouraged to notice change by the way that the method structures your attention. Let's say you do Goenka Method and you've got a ten-day retreat and you spend the first three days doing ānāpānasati just focused on the breath at the nose tip to get some concentration going. Then what do you do?

You sweep the body systematically up and down, and what are you constantly being urged to see? The changing sensations. Don't stay at one part for very long—just keep moving. Why? Because you're being encouraged to see change. And this is what I mean by "doing change." You can deliberately cultivate that perception.

The way Mahasi Sayadaw structures this is through the framework of grounding object and secondary object, particularly beginning with distraction. I'm following my meditation object when suddenly I know that I'm distracted. We've been talking about this whole process. Now if I'm just meditating for serenity, as soon as I notice that I'm distracted, I simply drop it, forget it, and go straight back to the meditation object. I have absolutely no interest in this distraction whatsoever. As soon as possible—back to the meditation object. The emphasis is on the continuity of awareness with this one meditation object.

But Mahasi says no. As soon as you know that you're distracted—in other words, awareness has gone from here to here—as soon as you notice that turn, face it, directly encounter it, note it deliberately, maybe briefly, maybe for a longer period, and then deliberately come back to the grounding object. In other words, awareness goes here, then there, then back here, then there, then back here: here, there, here, there, here, there—change, change, change, change, change. The method is designed to stimulate that view of impermanence. It's doing impermanence.

Does that make sense?

"So just pulling the mind back without noting—is that not vipassana? Is it more of a serenity concentration practice?"

Yes, it's more on the serenity side than the vipassana side, where the only interest and concern is with a single object. You just don't care about anything else. The other stuff has no significance—it's not important. Whereas here, we've been talking about the nature of distraction. How does distraction work? There's the forgetting, there's the remembering, what feeds the distraction. In other words, look at the process of distraction. It's important. It's significant.

Now, it would not be significant to someone doing serenity practice. "I don't want to hear about distraction. I don't care about distraction. I just want to stay with the one thing." But with Mahasi, it's "No—start to be interested in the distraction."

Depending on the teacher, Sayadaw U Pandita is definitely more interested in the grounding object than in the secondary object. But even there, what he wants to know about are the changes in the grounding object. Let's say I'm doing breathing as a medit-

ation object for serenity. All I want is a nice smooth experience. I'm not interested in how it changes. I'm not interested in whether the breathing five minutes into a sitting is the same as the breathing fifteen minutes into a sitting, or thirty minutes into a sitting.

But if I'm reporting rising and falling of the abdomen to Sayadaw U Pandita, he wants to know: How does it change in the course of the sitting? He wants to know how the secondary object changes. It's all about change.

So you're being trained to perceive change, and you start to see it even when before you never noticed it. The way I talk about it, I say: Start getting interested in the fact of change. Start being particularly interested in the intersections of experience—the place where one thing becomes another. That's interesting.

And I talk about it in terms of: Something happens. What's feeding this? Change. What does this feed? Change. Change.

So we start and the foreground of awareness is occupied by a meditation object that changes. So we've got foreground meditation object and we're noticing that there's change. There's a sense in which the background is change. Foreground, meditation object. Background, change.

At some point, there's a perceptual shift and we realize that what we're looking at is not a meditation object which is changing. We are looking at the fact of change and it's happening in this particular meditation object. It's a perceptual shift. Does that make sense?

Now this shift is not something that we can do. What we can do is train ourselves to be sensitive to the fact of change. But this foreground-background shift, when what we're noting is actually not so much the object but the fact of change manifesting in the object—this is not something that we can do. It's something that happens, or doesn't happen, when conditions are ripe.

It's very subtle. In fact, it's so subtle that it can happen and the meditator doesn't even realize it. And it can be days, weeks, months later that it suddenly occurs to the meditator, "Oh, this is what's been going on. I knew my meditation was different somehow, and now I realize that's what's different about it. Actually what I'm looking at is the fact of change, which is happening in these familiar things."

So it's not something that can be done, it's not part of our agenda. We can't do it, but we can prepare the ground for its arising. The Buddha often uses agricultural metaphors. I cannot make an apple appear, but I can plant an apple seed in the appropriate place and look after the tree. And sooner or later, an apple will fall into my hand. But I can't make the apple appear.

So what we're doing is preparing the ground and cultivating the conditions so that this perception of impermanence will arise.

"Patrick, I'm a little bit confused. I'm probably suggesting I'm way away from being able to observe this, but are you saying that when the foreground shifts to the background—oh, sorry, yeah, so when the background comes into the foreground generally, and you notice that actual movement of that, is that the point of change that you're talking about here that's different to the aspects of change that we might see?"

Usually at some point you notice that that shift has already taken place. Generally you don't see the actual shift take place, although you can, but usually you notice it's already happened. As I said, it's so subtle that often people don't even notice it. When it happens, they don't notice it. It's only later that they realize this is what's happening.

We got a taste of that this morning when we were doing that exercise where you're holding the meditation object. Then you loosen your hold a bit and then allow things to move. That's designed to give you a taste of what that might be like. But the fact that you're struggling with the concept has got nothing to do with whether or not you're actually perceiving it. These are two completely different things. One has nothing to do with the other.

"When you say 'do,' we can't do it, I'm understanding that we can't necessarily say, oh yeah, intellectually, there's change. What we need to do is have an experience of it, so that it arises as an internal insight, rather than a thought about things."

It's not like an insight that arises from thinking about someone telling you that your mind changes. Most people will say that, but they really don't have the experience of that until they notice these foreground-background shifts. And that's another aspect of the relationship between concept and experience.

At Mahasi Center they have a number of different teachers who teach different populations, and so there's one or more teachers whose job is to teach the monks who have done the study—the monks and the nuns who have studied and have got their Dhammacharya or further degrees. Because the basic pattern for a career monk or nun is first you study, then you meditate.

And so these monks would come into the meditation center with a degree of understanding of Buddhist philosophy which would make a person from a Western university with a PhD in Buddhology look like a kindergarten kid. And of course they think they know. Apparently they're very careful about who to pick to teach these characters because these are the hardest nuts to crack—because they think they know. So the concept gets in the way.

And Sayadaw U Pandita always liked it when a new student would roll up and they know absolutely nothing about Buddhism, and they'd be delighted because the concepts are going to be minimum interruption here.

So this is the perception of impermanence starts to develop, and according to the tradition, insight meditation begins at this point. So let's say you're doing Mahasi meditation and you're told that the Mahasi method is an insight meditation technique. And so you start—yes, rising, falling, distraction, rising, falling, whatever. You are not doing insight meditation. You are doing a preliminary serenity practice.

Insight meditation begins with the perception of impermanence. When the meditation object is the universal characteristic of impermanence.

That's the beginning of insight meditation.

Further, her mindfulness—and I was mistaken in the early part of this, it's actually three sentences we're doing tonight, but I think we've got time for this—Further, her mindfulness, *atthi kāyo*, there is body, or body is, is established just for understanding, just for continuous mindfulness.

This sentence gets variously translated because the language is really simple but the concepts are really hard to get a hold of. Her mindfulness, *atthi kāyo*, is established, *ñāṇa-mattāya, paṭissati-mattāya*—just for understanding, just for continuous mindfulness.

So let's go through these terms. What gets established is the mindfulness, and this is again in relation to where the body is the meditation object. Mindfulness is established, there is body, or body is, or this is body.

What is happening here is that the Buddha is squeezing language to try to convey complete intimacy with the meditation object. And this expression, *atthi kāyo*, there is body, or that's body, represents what he calls *suññatā vakkanti*, the entry into emptiness. What it refers to is a relationship of radical simplicity and radical intimacy. It's just this. Just the experience itself, not projecting anything onto it, not assuming anything about it, not trying to get anything from it. It's just this.

So everything else falls away. Remember I talked about how when we start to practice we notice that our normal relationship to experience is one of "What's in this for me? What can I get out of this?" So I'm always judging the experience. This meditation period—is it good enough for my purposes? Am I developing a nice concentration or a nice insight? And even this inhalation, this exhalation—is it good enough? Is it serving my purpose? So the relationship is instrumental. I'm doing something to get something. Have you ever approached meditation like that?

What the Buddha is talking about here is where all that falls away and it's just this. I'm not doing it for anything. And it's nothing more than what it is.

Another way that the Buddha talks about it is *tathatā*, suchness, just thisness. So you have the term *tathatā*, just thisness, and you have the *tathāgatā*, the one who is in a state of gathā, just this—the *tathāgata*, the awakened one.

"Just this *tatha*?"

Tatha, yeah. T-A-T-H-A. And then if you turn it into an abstract noun, like empty, emptiness, you add *tā* at the end—T with a long A, with a macron on top.

"Isn't there also a trick with that? It says coming and going or something like that."

Oh yeah, it's *gatha*. *Gatha* is past participle of the verb *gacchati*, to go. So *gatha* can be "is gone." *āgatha* is "come." *Tathā gatha* could be broken up as *tathā gatha* or *tathā āgatha*—thus gone, thus come. And different traditions translate differently. I think that in the Chinese, because Chinese is very different from Sanskrit and Pali in terms of its structure, they had to pick one of the two. I think they might have picked the "thus come" as the characters, but I can't remember now.

"Aren't you doing it to get enlightened? Is that a personal question?"

Well, yeah, obviously from the source of the question, it's a personal question. Because you're saying that the judgment about the breath or what I'm doing right now, is it good enough for my purposes? And then you just... it sounded like the idea was that you're not doing anything to get anything and yet which I'm happy with but I kind of feel that I ought to be doing it to seek enlightenment.

All of that—I'm doing it for enlightenment, I ought to be doing it for enlightenment—all of it belongs in the realm of concept. It's a concept about the experience, it's not the experience.

One time that struck me quite clearly over the past few years. I've been doing my own retreats at Saranath Buddha Sanctuary, this place where I teach in Malaysia in December, and they have these magnificent huts that as a visiting teacher I get to live in. Big tropical hardwood veranda for walking meditation and so on. And when I'm practicing there, every day I clean it out. So it's very minimalist and I sweep the floor and then I mop the floor. And I do it as a kind of mindfulness exercise.

And one day I was doing the mopping. And I wasn't thinking, I was just mopping. And then suddenly a thought arose in my mind. Years ago, doing Zen meditation, being part of the Zen tradition, I'd heard the expression—and this is Japanese samurai Zen—wielding the sword with empty hands. And I, of course, had no idea what they were talking about, other than carving people up. But it was like I suddenly realized I was wielding the mop and my hands were empty. There was nothing there except the mopping. It was totally intimate.

Now at the level of concept I'm cleaning the floor so I have a nice clean environment which helps me meditate. But in that movement, none of that was there. It was just that's all. And this is, there is body. This is what the Buddha is talking about. So it's the experience of complete intimacy with whatever it is that you're doing.

You're looking very suspicious.

I believe you conceptually, but I don't get it.

And I'm bending over the lines and put it on the back burner.

Put it on the back burner. It could be happening tonight or tomorrow. Because time's got nothing to do with it.

And then, so, atthi kāya, body is, or there is body, just for understanding, just for continuous mindfulness. Jñānamattāya patissatimattāya. The mattāya, it can't be translated literally, but basically it conveys the sense that there's nothing beyond this. This is not for anything. So there's understanding which isn't understanding for something. It's just, I know this.

And then you have the same with not sati but patissati. Usually the Buddha uses the term sati, mindfulness, but sometimes you find patissati. And different scholars have different ideas about this. Some people say, look, it makes no difference. Sati, patissati, take your pick. Who cares? It's the same thing. I always am suspicious of such things because when I read the Buddha, it seems to me that he's very careful with language. So if he says patissati, it's because he means patissati. So I'm assuming that there's something else going on.

The prefix pati indicates again. It's like the English "re," as in remember, recognize, recognize, know again. It has the same function. So patissati is continuous mindfulness. So mindfulness without a gap, unbroken. And when mindfulness is unbroken, when it's continuous, then it becomes really, really strong, very powerful, very quickly. It doesn't take long for this to get really strong, if it really is continuous.

Pati can also indicate back in a recursive sense, so to look back. In other words, here it's mindfulness of mindfulness. Remember we talked about awareness of awareness. There's this recursiveness within awareness itself. So we're not just aware, but we know that we are aware.

Here the recursiveness has matured to the point that it dominates the experience. And this recursiveness is always associated with clarity.

It's like when I am distracted by something—at first, when the distraction begins, I don't know that I'm distracted. Then suddenly I know that I'm distracted. In that sudden knowing, the whole situation becomes clear. Before it wasn't clear—it was like a dream. But then suddenly, bang, it's completely clear. The situation is totally clear.

With that clarity, the awareness is penetrating, stable, and again, clear.

So patisati indicates both the continuity of mindfulness—and if you read Anālayo's book on the Satipaṭṭhāna Sutta, he goes for this interpretation. He says this is what it refers to. But to me, it also indicates the depth and the clarity of the mindfulness. In other words, it's mature. The mindfulness is mature.

And again, the phrase matāya—paṭisati matāya—means all of this is not for anything else. There's no agenda here. All agenda is gone. Complete intimacy.

So the practice is radically intimate and radically simple. There is no sense, as I said, of any agenda, and therefore there's no sense of anyone who has an agenda. There's no sense of anyone who is defined by the agenda.

I walk into this retreat with an agenda. I come here because I want something. If we didn't want something, we wouldn't be here. So we've all come looking for something. We want something. And we are, at least in part, defined in terms of what we want.

When that agenda disappears, that sense of definition disappears. That sense of identity disappears. If there's no agenda, there's no self. There's just this.

I think, although there's more to discuss here, we've pretty much covered it. That's the first three sentences. We'll do the next sentence tomorrow night.

Any questions or comments?

"Would you mind just reading the original again?"

I should have them together on different pages. Here it is:

"In this way she lives tracking body as body internally, or she lives tracking body as body externally, or she lives tracking body as body both internally and externally. She lives tracking the nature of arising as body, or she lives tracking the nature of ceasing as body, or she lives tracking both the nature of arising and the nature of ceasing as body. Further, the mindfulness 'body is' is established just for understanding, just for continuous mindfulness."

So those are the three sections. And as you can see, there's a lot in those sentences. This is typical of the suttas. They're compacted for memorization purposes and meant to be unpacked. So this unpacking is commentary.

This is how all the traditions are conveyed—you have sutta and then you have commentary. After the Buddha, this whole idea of sūtra became highly developed. Have you come across the Yoga Sūtras, potentially? Those are centuries after the Buddha, but they're a good example of the genre. The prize basically went to whoever could pack the most meaning into the fewest possible words. This was an art among those who composed these texts. The job of the teacher was to take it apart and unpack it.

"Patrick, that last sentence—I think I've always come across a translation that says 'there is body, this awareness is established just enough for complete mindfulness.'"

That's the *matāya*. It can be translated as "enough" in the sense of—it can be either "just enough," no more than just enough, grammatically translated and interpreted as that. Just enough for this—a kind of minimalist approach. Or it could be, *matāya* could mean "for just this."

Yes, so what you're suggesting is actually a totally different interpretation—which I find more convincing myself. Certainly a much more raw and profound kind of interpretation. You're saying it is just as it is, as you've been saying—no agendas. Rather than the bare minimum you need to get through, rather than fifty percent on the scorecard.

I've seen those translations and they didn't make a great deal of sense to me. When I borrowed into the Pali, I thought no, I think they're talking about something else. But this again is my interpretation, and we've spoken about this process before.

This is something I did when I started my PhD in Buddhist studies. I was faced with the challenge that I wanted to do a meditator's reading of dependent arising, because previously—not so much these days—but most scholars who studied early Buddhism were not meditators, and they really had no idea what it was about. And so you get these bizarre interpretations.

But if you're in an academic context, you can't just say, "Oh, all those fellows there, they're all wrong because they didn't meditate, but I'm a meditator, so you can believe me." You can't get away with that.

So I had to figure out a methodology by which I could do a meditator's reading of these texts. I spent a long time studying methodology and was aided by my associate supervisor, whom I carefully picked. He was an expert in the Hebrew Bible, particularly the prophet Isaiah. He knew absolutely nothing about Buddhism except what I told him, but he knew pretty much everything there was to know about how to read an ancient text. So he was fantastic.

My first chapter was all about different ways of reading texts and different ways of reading these texts. The examples I gave: take someone like Mahasi Sayadaw. He's reading the text as a practitioner, but as a practitioner who is committed to the full Theravada orthodoxy. So there are certain interpretations that he finds permissible, and others that are not, and are simply never mentioned.

If you read Ajahn Buddhadasa, the famous Thai teacher, writing about dependent arising, he's coming out of the Theravada tradition, so he's got this loyalty to that tradition. But he's reading it as a practitioner who has no commitment to the Theravada orthodoxy. So he comes across as quite different.

You read someone like Jack Kornfield—he's reading the same thing, but he's not committed to the Theravada tradition. He's reading it in a completely different cultural context, matching it up against Western psychology on one hand, personal experience on the other, bringing the text and experience together. So you get different communities who read these texts in different ways, and they come up with different things.

Which is the right one? There is no right one.

If you're a practitioner, how do you know if your understanding of the Buddha is correct? It's really quite simple. Is this understanding leading to the lessening of *dukkha*? Is it leading to the cultivation of the wholesome and the abandonment of the unwholesome in your life? If it is, it's the right interpretation. If it works, it's the right interpretation.

So there's always room for different ways of reading, again because they're so dense. Grammatically there are all sorts of ways you can read this, and even philosophically there are all sorts of ways you can read it. But when a practitioner or practitioner community reads it, they're reading it from a particular angle, within a particular culture, for a particular purpose—and that will affect the whole thing.

One thing that Ed told me once, my associate supervisor—he said, "Imagine you're on this side of a river. On the other side of the river is the text that you're studying, and the river represents time, thousands of years maybe. If you're doing historical study, what you think you're doing is crossing the river to go to that text. But the other way of looking at it, or the other way of doing it, is you don't cross the river to the text. The text crosses the river to you."

In other words, here I am today reading this. It's a whole different project. And as practitioners rather than historians, that's what we're interested in. What does it mean to this community today? That's what's important.

And that's what governs the way that I interpret these things.

Any other questions or comments?

Okay. Thank you very much.

CHAPTER 14

Awareing

Patrick Kearney · 1h15

> *In this dharma talk from a month-long retreat, Patrick Kearney shifts focus from meditation objects to the process of 'awareing' itself—exploring the mind that knows the meditation object. Drawing from the Satipaṭṭhāna Sutta (MN 10), he guides three progressive exercises that develop sensitivity to both the object of awareness and the awareness that observes it. Kearney discusses the complementary practices of 'noting' (actively directing attention) and 'noticing' (receptive awareness), explaining how both approaches serve different temperaments and circumstances. He addresses the relationship between samatha and vipassana approaches, the role of vedanā (feeling-tone) in developing sensitivity, and the importance of recognizing wholesome pleasure in meditation. Using John Hale's metaphor of seeing through a window into a garden, he illustrates how awareness itself can become visible—like recognizing the window through which we view experience. The talk includes practical guidance on open awareness practice, its potential benefits and pitfalls, and how different meditation styles suit different minds and moments in practice.*

Over the days we've been looking at different aspects of the practice, basically examining different possible meditation objects. As we mentioned, one thing that characterizes satipatthana is that anything at all can be a meditation object. This is one of its characteristics that makes it impossible to really pin down.

Today and tomorrow we're going to approach it from a different angle. Instead of being concerned about the meditation object, we're going to look at the process of being aware of the meditation object. Remember we talked about this—we're always working with this dyad: there's awareness and the object of awareness, or we could say there is the process of awaring and there's what we are aware of.

Today we're going to have a look at the awaring.

We're going to do three little exercises and have a discussion in between them.

Let's start with the first one. If you get into your meditation posture and from there, settle awareness in the body. I'm going to mention breathing as the meditation object in these exercises, but I'm using breathing not because you're supposed to be using breathing, but as the generic meditation object. So if you have something else, just use

that something else and translate in your mind. When I talk about breathing, I'm talking about whatever your meditation object is. But otherwise, just use the breathing if that's not a problem for you.

So, settle awareness in the body and begin to focus on the movements within the body that indicate breathing. Track the movements of your breathing. As you track the breathing, are you being distracted? And if so, how?

Rather than ask you what happened, I'd just like to make a comment. Or ask you, actually, would you regard this exercise as being pretty much kindergarten playtime—bleeding basic? Like, follow your meditation object. Are you being distracted?

I think it depends on what you make of it. What did you make of it?

"I was really interested to see that my breathing had changed from before. That was fascinating. And then really watching if distraction came in. I'd really been interested to see if it would."

"And did it?"

"No. There were things on the periphery but they didn't distract me. So it was really interesting to see like a challenge. So I enjoyed that."

Good. Anyone else?

"I noticed that after I was being distracted as usual by thoughts, but after you asked were we being distracted, the thoughts didn't actually—after that they didn't take my attention away. There were still thoughts but I was able to keep them within the awareness of the breathing and the thoughts together."

I mean, I managed to disturb your distraction. I distracted you from your distraction. It's a pity that from time to time I don't have that little reminder.

"I thought your question was interesting, Patrick, because in a sense it is the basic thing. To me that's the thing with meditation—in a way it's always the same thing but then it's always different too. And I found it very interesting to have the breathing and to be kind of noticing the distraction within the breathing, within the awareness of the breathing."

So the view has changed over the years.

"It's really weird. This time when you went, 'I'm distracted,' my mind went, 'Oh, okay then.' And it took it like a command. All right, then off we go. I don't think that's quite what you meant. That's what it took."

That's what the responses are getting at. On the one hand, this is going back to beginnings—really, really basic. But the view has changed as we practice. You notice that what we were doing there was following a meditation object and then following the mind that knows the meditation object. So there's the meditation object and it's doing certain things, but I'm also noticing the state of the mind that's doing the meditation. Is it distracted?

Is it not distracted? If it's distracted, how is it distracted?

So we've got two things. We have the object of awareness, we have the mind that is doing the awareing, and we're actually aware of both. Now this is very ordinary, but at the beginning it comes as a shock to the new meditator.

People often when they start a meditation practice report being shocked to discover how much they think. In fact, some meditators when they do their first retreat are absolutely convinced after several days that this meditation is making them think ten times more than they ever have before. They're absolutely convinced of it. Whereas the most likely explanation is they're just ten times more sensitive to the thinking which is already going on.

So as we do this practice, the mind becomes more sensitive and it notices more. It notices more about the meditation object, but it also notices more about itself, the mind which is doing the awareing.

My experience also is, if there's something particular I want to focus on, and I'm tested—like, I'm tested by this and this and this—are you really wanting to do this? So you uncover the relationship. It jumps out to be recognized.

So what we're interested in this morning is exploring the mind that is doing the awareing and checking that out.

Shall we have another exercise? We'll take it one step further. Again, establishing your posture and settling awareness in the body.

Begin to focus on the movements within the body that indicate breathing. Track the movements of your breathing. How is your breathing? Is it gross or subtle? Are the movements of the breathing high or low? Do they stay the same or are they changing? Are the movements long or short? Study the details of these movements.

How is the mind that is tracking the breathing? Can it follow the breathing without difficulty, or is it easily distracted? Is it interested or bored? Is it peaceful or agitated? Is it alert or dull? What is the state of mind that's tracking the breathing?

So do you see what we're doing in that one? Track the meditation object and at the same time track the mind, the condition of the mind that's tracking the meditation object. Could you do that? Is that possible?

"Yeah, no problem. I thought that breathing sort of fell into the background a little bit when I did that."

So there's a foreground-background. It's not that they're both equally there. It's just that you foreground one, but there's others in the background. Then you can foreground the other one, and the first one's in the background. But they're both there?

"Yeah, yeah. It was a subtle shift, shifting back, but it was still there. It sort of broadened out to sort of take in more of the mind and what it was doing."

So it involved a broadening out of the field, not being focused in.

"My mind is like lint. After a while the mind is lint with the breath, and then there's sort of that awareness watching it."

"The breathing initially is different to that later on. That's what I noted, that at first it's quite sort of labored almost. And then I started to go to something what I would describe as pranayama. It's like the three-step breath and then roll out. That happens to me frequently. I get that quite often. And then after that, there is a phase where the breath becomes really deep. And that's when the mind is lost at peace, becomes very quiet."

So before then, when the breath is labored, what's the mind like?

The breath is labored, the mind is labored. But then the minute that sweeping rhythm takes over, the breath comes together somehow and everything settles.

When the breath is labored, the mind is laboring. Indeed. So you have the object, the mind that knows the object, and also the relationship between them—a connection, things happening between them.

Doing this practice involves an opening out, not being tightly focused on the object. I'm opening it out so I'm getting a sense of more around the object. The body served well as the object initially, but since the body isn't my primary object at the moment, I shifted to feeling, which is what I'm working with. Then I found that feeling is a bit more subtle than the body. It was too much to have two really subtle objects—the mind is subtle and the feeling is subtle—going at the same time. That combination just slid out and dissipated into distractions.

So I came back to the body as the grounding object, and then I could keep the object and that awareness together. But not if it was a more subtle object.

Many years ago, John Hale tried to explain to me the nature of the first insight knowledge, the first vipassana ñana. He explained it through this little thought experiment.

Imagine, he said, this practice is like you're in a room that looks out over a garden through a big picture window, and you're looking through the window at the garden. Your teacher is beside you, urging you on. The teacher says, "Look out there and tell me what you see."

"Well, I see the garden."

The teacher is not satisfied. "Look more closely. What do you see?"

"Oh, I see a rose garden."

"Look more closely. What do you see?"

"I see a bed of roses."

"Look more closely. What do you see?"

"I see a single rose bush."

"Look more closely. What do you see?"

"I see a single rose."

"Look more closely. What do you see?"

"I see a rose petal."

"Look more closely. What do you see?"

"I see a dewdrop on the rose petal."

"Look more closely. What do you see?"

"I see the window."

What we're working on now is learning to recognize the window. And the window can be the hardest to see because it's the most obvious. The window is, of course, awareness itself. Awareness is the medium through which we look out at the world. It's so obvious that it's easy to miss, but it's an essential aspect of the whole thing.

If the window is dirty, the view changes. If the window is wet, the view changes. If the window is colored, the view changes. If the window is clear, it seems to disappear.

But it's still there. And as the practice develops, we begin to notice the window and we can even pay attention to it.

This is bound up with what we discussed when we started the retreat—how the two basic movements in the Mahasi approach are noting and noticing. When I note something, I am deliberately aware of it. I aim my awareness, choosing to be aware of this particular thing. For example, we talk about the grounding object or the primary object. I deliberately aim my awareness and make that particular experience the center of my field of awareness, bringing it to the foreground while everything else goes to the background.

This is the foreground-background structure we've been exploring. What I'm noting, the point of interest, becomes the foreground. The background is still there, but the interest lies in the foreground. So I am noting the grounding object or primary object, and I am noticing everything else.

Another way of looking at it: we do the noting—noting is active, it's what we do in meditation practice. We don't do the noticing—noticing is receptive, we receive what's happening. It's the difference between sending awareness out to the meditation object versus allowing the meditation object to come to us. These are the two basic movements, though there are different combinations and balances between them.

Usually when people start meditation practice, what's emphasized is the noting: ground yourself on this, do it. The quality of effort and determination is quite strong. But as the practice develops, the noticing also becomes stronger because the mind becomes more sensitive and receptive.

Some approaches to meditation emphasize the noticing, the receptivity. Some approaches actually use that as their grounding object from the very beginning—practices like Dzogchen, Mahamudra in the Mahayana, Shikantaza in Zen, open awareness as discussed in Theravada.

It's interesting how fashions change. When I first went to Malaysia some years ago, it was all Mahasi, Mahasi, Mahasi. Every student I interviewed came from a Mahasi background. Over the past few years, it's all open awareness, open awareness, open awareness. The Mahasi Method is just so twentieth century—really, why would you bother? Presumably one day the fashion will change again.

The teacher having a big influence in Malaysia is Ajahn Dtjanissaro. At Sasanarakkha Buddhist Sanctuary, the abbot Bhante Aggacitta and his second-in-command Bhante Kumara are both now practicing Ajahn Dtjanissaro's open awareness style, so it's particularly prominent there.

Noting makes the mind stronger and sharper. You'll notice those exercises we did early on were all about precision aim—send your awareness to precisely this, not that, but this. Noticing makes the mind more sensitive.

Noting is closely linked to effort, obviously. Noticing, I think, is closely linked to vedanā, to feeling tone. It's about cultivating sensitivity. Remember when we talked about vedanā in terms of phassa, contact, which refers to the activity of the six senses? Each sense for the Buddha is a particular kind of sensitivity. Mind—the word the Buddha uses is mano, which is cognate with our English word "mind"—mano is a sensitivity. The noticing is all about cultivating that sensitivity, making it more receptive, more sensitive.

So, as the practice develops, we start to work on – well, rather, we have more options available to us. Do I emphasize the active, or do I emphasize the receptive? Or do I have a mixture between them? And when do I move from one to the other?

The noting emphasizes the object of awareness. The noticing emphasizes the mind that's doing the noting. And of course, the object might be the mind. So I'm noting a mind state, but there's a mind that's doing that. And I could be noticing that mind. Is this making sense?

This is the kind of arena within which we play, and we can play different styles depending on circumstances. But I think that one aspect of this is, over time, becoming more sensitive to the mind which is doing the practice. This plays an increasingly important role.

Last night when I was talking about how we can approach the practice simply as a set exercise where I'm just obeying orders, I might be so fixated on the noting that I completely cut off from the mind that's doing the noting. This does happen. It's possible, for example, if we have an aversive mind – and I won't name any names, I won't confess to this – but if we have an aversive mind and we're diligently noting, we can use the meditation as a way of burying the aversive mind.

I don't know if you have, but I've met long-term meditators who are quite dedicated and quite skillful. And they're the kind of people that I would not like to meet alone on the street on a dark night, because I would not like to be there when the lid blows off. I just get this sense, it's like their meditation practice is keeping the lid firmly closed.

Pressure cooker. Some people can do it because they have good concentration power. But sooner or later that lid's going to come off, and I would much rather not be around when it comes up. But if you've been around the traps long enough, you probably have met somebody like this.

Samadhi, concentration, has this effect. One image the Buddha uses is this: he says concentration is like a pool of water choked with water weeds. You have a big earthenware pot, and you put it on top of the water and it just floats there. But it starts to absorb the water. The more water it absorbs, the heavier it gets. And the heavier it gets, the more it sinks. So you look into the pot – ah, the water is completely clear. But just outside the pot, it's a complete mess.

Samadhi suppresses the defilements, the kilesas. That's its job. That's what it does. And it's possible that if we're so focused on pounding away on the meditation object, that we can actually bury all the problems that brought us to the meditation in the first place. But sooner or later that pot is going to disappear and back it comes again.

So I think an important part of this whole thing – we'll be talking about it as becoming increasingly intimate – is moving towards the receptivity, the sensitivity, the noticing. It plays a very important role. And it's clearly obvious in daily activity, for example. That's one area where its role is so clear, because I'm not actively doing something there. I'm not doing a set meditation exercise.

*_Question_*: Do you have a note that you use to note them? Do you have to notice them? Like this morning, for example, I was coming out of meditation and walking, and I noted "knowing, knowing" as I was walking, which is sort of cognitive. You're using a cognitive strategy for a vedana experience. I noted that it was interesting because I was becoming cognitive about the feeling experience of knowing.

This is part of the inherent recursiveness of awareness – the awareness of the awareness. One of the ways in which it's spoken of is this metaphor of light. So the light illuminates everything, including itself, in a sense. It's just a question of where I look. Wherever I look, it's illuminated, including the light itself.

This approach—this direct awareness practice—is actually found throughout all the traditions, though in the West, some schools seem to have cornered the market in terms of marketing. Mahamudra and Dzogchen practitioners, when you read their literature, write as if they've invented something entirely new.

I often listen to John Dunne's talks—he's a guest teacher at Upaya Zen Center, which produces some truly fascinating content. Dunne is both a Buddhologist and academic in Buddhist studies, specializing in Tibetan Buddhism while maintaining his own practice

within that tradition. He's deeply connected with cutting-edge neuroscience and contemplative research—the Mind & Life Institute, the Dalai Lama's scientific dialogues, all of that territory.

When he teaches meditation from the Tibetan Mahayana perspective, you'd think listening to him that the Tibetans invented everything—as if the Buddha knew nothing about these methods, but fortunately the Indian Mahayana philosophers started developing them centuries later, as if this understanding was completely unknown beforehand and as if nobody else has access to it. It's quite peculiar, really.

But in fact, I think this awareness runs through everything, because it's in a sense bleeding obvious—an underlying, essential truth that's not even particularly esoteric.

Shall we do one more exercise? We'll take this exploration one step further.

In this practice, you'll notice we're engaging in something two-fold: having a meditation object and noting something, while simultaneously cultivating sensitivity to the arena within which this takes place—and this arena is the mind that's doing the meditation. So we're going to take another step into that territory.

Construct your posture, then settle awareness in the body. Begin to focus on the movements within the body that indicate breathing. Track the movements of your breathing. Follow your breathing. Be interested in what is happening to your breathing. It is as if you are holding the movements of your breathing with your hand—holding it there so you can follow it.

Now relax your hold on your breathing so your hold is more gentle, less intense. Allow yourself to become sensitive to the broader field of awareness around your breathing. Become interested in the whole field of experience of being aware of breathing.

Don't do anything with the breathing, but just hold the mind steady. The breathing comes and goes. Be interested in this without clinging to it. The mind changes all the time—be interested in this without clinging to it. Awareness moves from one object to another. Be interested in these movements without trying to stop them.

Don't force anything. If the breathing slips out of view, let it go. Just notice that it slipped away and what replaced it. Things come and go. Let them. Just stay aware that things are coming and going.

If you get lost in thought, come back to breathing. When you feel settled and stabilized, relax your hold on your breathing and open up to the mind itself, letting the objects of awareness come and go.

How was that? What happened?

"Pleasant later."

"Just let the thoughts come and go and don't note them. Is that another type of meditation?"

That's the noticing—that's open awareness, that's the straight noticing.

For me, it's like setting up a posture. When I meditate, I set up a posture of the body, and then within that posture, I meditate.

With the mind, it's like setting up a posture of attention, and then if I simply hold that posture, I can let go of the specific object. Things are moving, but that posture of attention remains. It's like everything is just moving in and out of awareness and I'm simply with it. It's rather like establishing a posture of the mind.

"Would I get in trouble with a Mahasi teacher if I did that?"

"You'd definitely get into trouble. Well, not necessarily."

I stumbled into this at the Mahasi Centre with two different teachers. One time with Sayadaw Lakhna, I was doing the practice, noting the primary object. I remember coming into an interview and saying, "My primary object has changed. It's now the entire universe. Is this okay?"

"Yes, it's okay."

The same thing happened, but it arose spontaneously. Later it shifted back to something more normal. The same thing occurred once when I was working with Upandita. I asked him the same question, because I knew he's fanatical about rising and falling. I said, "Well actually, the mind doesn't want to note rising and falling. It just wants to note the whole universe. Is that all right?"

He laughed and said, "If you're noting the whole elephant, why should you be worried about the details?" You know the image of the elephant.

My experience with all those teachers is that if it happens spontaneously, they don't care. If you direct it, if you change it intentionally, they don't like that, because they've got a certain agenda.

I think one of the strengths and weaknesses of the Mahasi method is that it has a very specific agenda and wants you to jump through very specific hoops for a very specific result. That gives it tremendous power that I think a lot of other approaches just

don't have. But equally, that's its shadow, its weakness—that it only does that. There comes a time when that becomes too narrow a box and it's time to move out of the box. But to go through that kind of training is immensely valuable.

"My feeling is that this follows my experience. I started very much with noting, and it was a big struggle. It became a lot easier when the noticing came in, when I let the noticing arise."

Yes, that's on the open awareness end of the spectrum. There have been times when that sort of thing has arisen spontaneously. But today, doing it as a direct practice—sitting down with the intention to work with open awareness—I've never really practiced in that way. A couple of times when I found myself with teachers like that, I felt like I didn't know what to do. The biggest experience was incompetence—the lack of skillfulness was really obvious to me. It was very much a feeling of "okay, well, back to kindergarten."

"What about this morning? Were you incompetent during that last exercise?"

"I was feeling that last night. Yesterday kind of sent me off in this general direction, and I feel like I'm wallowing around in a big swamp with no clue what I'm doing or where I'm going. Back to kindergarten—A is for apple, B is for bat, C is for cat."

Kindergarten is very useful. She just wanted to move quickly through the alphabet.

"Is there a shadow side to too much noticing?"

Yes, both approaches have their shadows. Every technique has its disadvantages. Every technique has its strengths and its weaknesses. There's no such thing—as I said at the beginning of the retreat—as the one true technique.

What you find is that some people do better with noting than with noticing. Some people do better with noticing than with noting. It just suits their minds. At certain times it's better to notice rather than note. At certain other times it's better to note rather than notice.

This depends on circumstances. Again, this comes back to the skill of the meditator. You've got to work it out for yourself. What we've been doing this morning—is this relevant to you or not? If it's not, forget it. Don't bother with it. But if it's relevant, if it's interesting, if there's something there, then play with it. Explore it. See what's going on. What does it have to offer? What is the dark side?

The dark side of open awareness is exactly as you've been talking about—floundering. Don't know what to do. Sliding. Space-outs.

One student shared: "When you said take a posture of the mind, I had huge washes of indigo and green with visual hallucinations. Thoughts were just gliding over the top like on a sheet of ice, but they couldn't come into this incredible space. It was total bliss."

The variety of responses is always amazing. But you can't generalize from one guided meditation experience—it may never happen again. Minds are incredibly different.

Some minds cannot take the noting. They cannot do it. They can try for years and it just never works. They get tied up in knots. Nothing settles. But give them the universe as an object—completely present, right there—and they flourish. Other minds are the exact opposite.

Part of the whole process is getting to know how this mind works and adapting to it.

A student asked: "Do you think you could delude yourself into thinking you are practicing correctly with open awareness?"

Absolutely. I think that's definitely the shadow—that you can basically not be meditating and persuade yourself that you are.

Another student reflected: "My practice is basically that kind of open practice, but I doubt myself. I think I should be doing something else—this is just too busy. One teacher told me I was just craving non-existence and dismissed it."

One of the challenges of open awareness practice is that the experience can be so subtle that it's actually difficult to tell whether you're meditating. The experience is subtle and natural. When I'm really focusing on something and developing samadhi, there's a kind of artificiality to it—this is not normal. There's an obviousness to it. I know this is a meditation state. But with open awareness, the result is so natural that it can be hard to tell. There's so little doing in it that it can be difficult to discern.

What you want to do is check the state of mind. Is the mind clear and at ease? This is the sensitivity aspect. You learn, particularly with open awareness, to read the mind—to read the state of mind as it's meditating.

Is the mind clear and at ease? If you're not really meditating, the mind will not be clear. The attention might be moving from one thing to another, but is there a continuity of awareness? Can you actually see the movements? Not that you wake up here, then wake up there, then wake up somewhere else.

Can you actually be aware of the movements? Is the mind clear as you do this, and is the heart at ease, peaceful, not disturbed, not caught up with longing and grief for the world?

So longing and grief for the world, longing and sorrow for the world. Is it falling into emotional entanglement, or is there a sense of stability, ease within the heart? And the window we're talking about—is that completely clear? And is there a continuity of awareness?

Then you tick those boxes and you realize, no, this is not normal deluded consciousness at all. This is quite different. It's subtle, subtly different, but it's definitely different.

What comes up for me is: And what next? And then what? It's like, here I am, and it seems like I've ticked all those boxes. And then what? Yeah, interesting question. And that's what I think is one of the interesting things about this style of practice—the "and then what."

Part of that is actually the perception of impermanence, the felt sense of no future. If I'm not meditating, if I'm in a normal, agitated, deluded state of mind, I know what's going to happen next. I've been here before. I know that soon I'm going to end this talk and head upstairs. I'm quite confident in that. But when I'm really clear about this right now, I really don't know it. I can imagine it, but I don't know it. I don't know what's coming next. And that's one of the flavors of the perception of impermanence.

When the Bodhisattva came to a dead end in his ascetic practices and realized this was a dead end and he had to change track, the question that he asked himself was: Why am I afraid of pleasure? And he resolved, "I will not be afraid of pleasure." An ascetic would ask that. I find that very interesting. I missed it for forty years or something.

The relationship to pleasure is really important. It gets you back to this visual bliss out, which happens to me when I'm doing open awareness.

"What, visual bliss out?"

Quite often. I remember being very confused and asking—I wasn't just doubting him, and I didn't really like his answer, but it kind of makes sense. His answer makes sense. His definition of meditating is really... it makes sense now. His explanation makes sense, because he says meditating is rather than really meditating. It's a bit circular.

For me, a touch too circular. So I thought, well, I'll just daydream. And if it's this easy, far out. Then I was driving home the very first time I did it, thinking, did I meditate? Like, what the hell? I was very confused, but also very blissed out.

As I was driving home, anyone who needed to be let in ahead of me, I let them in. I was just acting like such a nice driver. I'm not a horrible driver, but I don't notice all the other vehicles. So I was thinking maybe I was meditating, and the only way to know is that the fruit of it is some kind of driving compassion—unless that's just the fruit of samadhi, because I do get that sort of "well, so what" feeling, you know?

It is very subtle.

And this is true of any meditation approach. The deeper you go, the more refined and subtle it becomes. And your appreciation of what's going on has to adjust accordingly. With open awareness, this can be trickiest to work out, but I do think the shadow of open awareness is the wallowing—people who just persuade themselves that they're meditating when they're actually quietly spacing out. It's the middle way—it's always the middle way.

But there's nothing wrong with pleasure. In fact, developing concentration, samadhi, is one of the factors, and the Buddha says the immediate cause for the arising of samadhi is pleasure.

Of course, the predominant lay meditation tradition in our culture comes out of the Burmese insight tradition. If you're doing a traditional insight meditation practice, then what will tend to become most apparent to the meditator is dukkha rather than sukha. As one teacher at Mahasi Centre explained to me very cheerfully, he said, "Samatha meditation is close to sukha. Vipassana meditation is close to dukkha." And I thought, "Damn it! I'm in the wrong place."

So there is an emphasis on the relationship to dukkha in insight meditation with a capital I, capital M. And sometimes that has resulted in a culture which is actually fearful of pleasure. "So don't go there. Or it's dangerous, don't cling, don't cling." Okay, fine, don't cling to pleasure. But equally, people can cling to their pain. People do cling to their pain, ferociously. It's not that there's any particular danger in clinging to pleasure. There's an equal danger in clinging to pain. So don't worry about the pleasure. Enjoy it. Use it.

"Can I make a comment? In 1982 I was meditating for Joseph Goldstein, who was very much coming from the Mahasi approach then. And I was incredibly restless. Just so restless I couldn't even sit still. And he said to me, 'Just let your mind do what it wants to do. Just let it be like that.' And he described open awareness. He said, 'Practice that.' And it was the best antidote to restlessness. So, you know, I think it's around...

That was after he had written Insight Meditation, that classic book. I think he wrote it in 1979 or something. But that's coming from the Mahasi approach, and it's a strategy for..."

"You know what you said about the right effort? It just came to mind when you spoke about the right effort, in relation to this very disciplined approach with concentrating on the object and then also letting go. It's when you put the right effort—what is appropriate at the moment."

Yes. Absolutely. It's something to do with that. It's that sort of being aware and knowing what is right. And what's appropriate to the circumstances. And it's a constantly moving feast. It doesn't stay still. So it's a question of adapting. But it's also a question of meditating according to your particular kind of mind and finding a way that suits this mind.

"Back to the pleasure thing, you know, you were talking about vedanā the other night. But when you get to the second categorization of vedanā—so there's pleasant, unpleasant and neither—but then there's that ethical division of wholesome and unwholesome. So what we tend to forget is the wholesome pleasant feelings that are beneficial, useful and leading on. So it's all very well to remember the wholesome, unpleasant feeling, but we tend to imagine that somehow there's unwholesome, pleasant feeling and wholesome, unpleasant feeling. Well, that's not the way it is. There's any of the three—pleasant, unpleasant or neither—that can be wholesome or unwholesome, depending on the context and what the ethical result is."

So if you're having a pleasant feeling in your meditation, it's just as likely to be wholesome, especially if it encourages you to do more meditation and stay on the path and keep moving onwards. This is definitely a crystalline form of pleasure—bliss, happiness, and the like.

So play around with these teachings. If what we've explored this morning doesn't suit you, simply forget about it. Chalk it up as the morning's entertainment and move on. But if there's something useful here, then play with it, experiment, and make it your own.

Thank you for listening, and may your practice continue to unfold with wisdom and joy.

CHAPTER 15

Restraining the Senses: Indriyasaṃvara Practice

Patrick Kearney · 1h09

> *Patrick Kearney explores indriyasaṃvara, the Buddha's practice of restraining the sense faculties, which precedes formal meditation training in the gradual path. This foundational practice involves not grasping at the nimitta (themes) and anubyañjana (features) that draw our attention through the six sense doors - eye, ear, nose, tongue, body, and mind.*
>
> *Drawing from the gradual training suttas, Kearney explains how this practice protects against unwholesome states of longing and sorrow (taṇhā) by cultivating radical receptivity rather than active engagement. Unlike advanced non-dual practices in Mahāyāna traditions, this approach is presented as basic training that prepares monastics for meditation.*
>
> *Through guided exercises with seeing, hearing, and thinking, participants learn to receive sense experiences without the habitual 'doing' that creates entanglement. This practice of 'not-doing' cultivates natural mindfulness, equanimity, and ease while remaining fully open to whatever arises through the senses. The teaching emphasizes how this same principle applies both in formal practice and daily activities, offering a path of effortless awareness grounded in early Buddhist methodology.*

Yesterday we were looking at the structure of attention. We've been talking about the difference between the active and the receptive aspects of the practice. In the active mode, awareness is actively sent out to seek the object of awareness and hold it. In the receptive mode, awareness is simply sensitive and the object comes to us.

We talked about the way Mahasi expresses this distinction. He talks about noting and noticing. Noting is the active aspect—we go out. Noticing is the receptive aspect—we let it come to us. Yesterday we practiced with a kind of halfway house, where we send the awareness out and study the object but we also cultivate a sensitivity towards the state of the mind that's doing it. In the final exercise we were holding the attention steady but allowing different things to come and go through that.

We're playing around with the structure of attention, and today we'll take it another step further. We'll go back into pure noticing, pure receptivity and playing with that.

The particular way that we're going to do it is something extremely basic. These kinds of open awareness practices that we discussed yesterday you find throughout Buddhist traditions. In Mahayana there's a fair amount of marketing about how highly

advanced they are. Dzogchen, Mahamudra, Shikantaza—these are presented as very high-level, advanced practices, and obviously if you do them, if you're not enlightened, you're well on the way.

The way we're going to play with it today is one way that the Buddha talks about this in which it's not an advanced meditation practice. In fact, it's not even a meditation practice. When we do this exercise today we will not be meditating. You will not be establishing your meditation posture.

What we're going to do is indriyasaṃvara—restraining the senses. This is such a foundational practice that when the Buddha talks about it, he places it not in meditation—bhāvanā—but in sīla. If you look at the texts on the gradual training, restraining the senses comes just before the beginning of formal meditation practice. Apparently the original context would be that if you ordained as a monk or a nun in the Buddha's time, before you started your meditation practice, during your boot camp training, this is one practice that you would do. This would prepare you for meditation practice.

This is how the Buddha talks about it. He's describing the practitioner and talking about the relationship to the six senses:

"On seeing a form with the eye, she does not hold on to its themes and features. Since if she left the eye faculty unguarded, evil, unwholesome states of longing and sorrow might invade her. She practices the way of its restraint. She guards the eye faculty. She undertakes the restraint of the eye faculty.

"On hearing a sound with the ear, she does not hold on to its themes and features. On smelling an odor with the nose, she does not hold on to its themes and features. On tasting a flavor with the tongue, she does not hold on to its themes and features. On touching an object with the body, she does not hold on to its themes and features. On knowing a phenomenon with the mind, she does not hold on to its themes and features, since, if she left the mind faculty unguarded, evil, unwholesome states of longing and sorrow might invade her. She practices the way of its restraint. She guards the mind faculty. She undertakes the restraint of the mind faculty."

The whole thing revolves around themes and features, and the relationship with themes and features. In Pali, this is nimitta and anubyañjana. Nimitta is usually translated as "sign" and we've already talked about it with that translation. Here I've translated it as "theme"—I think I got this from Ṭhānissaro—and I think it fits well when we consider how the senses operate.

If you think about the eyes and pay attention to what they do, you'll notice they're constantly scanning the visual field. They're quite active: check, check, check, check. They're very sensitive to movement. There's a bit of movement and the eye goes there: What's that? What's that? What's that?

The theme indicates the general impression of the sense object when we first notice it—what's distinctive about it.

What draws us in? This "what's that" response sets the stage for deeper engagement.

Features are the details that appear when we go in and examine the object more closely and start to chew it over, trying to get a sense of what's going on and extract something from it. Both themes and features pull us into entanglement with the experience, and we react to it. Vedana comes in. We respond to it—we like it, we don't like it. We want to do something with it, get something from it, or lose something through it. We become entangled with the sense experience, and this is called the unwholesome states of longing and sorrow, which is basically craving, tanha.

We've talked about how this works in seeing. Something will grab the eye as it scans the field, then hold the attention. Just now, as my eyes were scanning the audience, they struck René's orange sock. Bang! There was a moment when the eyes fixated on that orange—the theme. Now let's say this really grabbed my attention and I start to examine it. Then come the features: "That looks really weird. It totally contrasts with the sober black and grey of everything else. I wonder if it was an accident." I start to chew it over, and the mind begins to work the experience—liking, disliking, interest, disinterest, "what's in it for me?" I start to get entangled with it. You can see how the process works.

You can observe this with the eyes regarding beauty and ugliness. The eyes scan the field. If they strike something perceived as ugly, they react: "Ooh, what's that?" and get entangled—"It's awful." Equally with beauty: "Oh, what's that? That's really nice," and we start to get entangled.

For the Buddha, the senses are active, going out and scanning their respective fields. Something strikes the sensitivity—"Oh, that's of interest." That's the nimitta, the theme. There we get drawn in and start chewing it over. The Pali for this process is anubyanjana—features—and the whole mechanism is called indriya samvara, restraint of the faculties.

This works the same way with all the senses. Take the mind, for example. Thoughts constantly arise—bits of mental stuff that the mind keeps throwing up. Then the attention goes to one of these and seizes upon it. For instance, there's an image of something that happened, something that might happen, or something that is happening that shouldn't.

In other words, something irritating. And the awareness goes bang, straight to it.

It has been known—I'm sure it doesn't happen in this hall—but it has been known that meditators in meditation halls often have their minds stimulated in this way by the behavior of their fellow meditators. These are advanced and highly experienced meditators. I'm sure no aversion has arisen regarding the behavior of our fellow inhabitants of this meditation hall. But if it did happen, you would notice how there'd be something arising first of all in one of the physical sense fields—hearing or seeing most obviously, smelling as well. You've got to tell me about this later! And then in the mind, thought arises.

Now this grabs the attention. This is the theme, and the theme here would be one of irritation: "This should not be happening." And the awareness would go to that and start to expand it and turn it into a story. "What the hell does he or she think they're doing? Where do they think they are? Were they born yesterday? This is supposed to be for experienced meditators." Blah blah blah blah blah. And this story of irritation and aversion begins to unfold.

Now you notice that when this happens, we fill in the details, and then there's a particularly juicy bit and we move on. Then we stop and we go back and we chew over that bit again because that was really good and that got us really riled up. Then we move on and there's another particularly irritating bit, so we come back and chew over that. So this chewing over the experience—this is the anubhyājana, the features. The theme is the initial impression, what draws us in. And the features are the way that we chew over it. And the more we chew over it, the greater the agitation within the citta.

The features are the details, and we often find ourselves going back and chewing over the same bit because it's particularly juicy. Having experienced a bit of that myself, I could just speak for myself and say it gives me an enormous sense of satisfaction in two closely related ways. One is the satisfaction of being right when everyone else is wrong. So it's pleasurable—there's a pleasure in that. But also I feel more real when I'm doing that. And in certain circumstances, depending on how angry I am, I also feel very powerful. There's a sense of power that comes from this.

The craving for existence includes craving for pleasures.

"Can the theme for the mind be a rejection of something else rather than an attraction?"

Yes, but the attention goes to that rejection. So there's an attraction to the rejection. We're talking about the movement of the senses.

Any other questions?

Now, not holding on to themes and features—what does it mean in practice? This is a practice of radical relaxation. Basically, if I look at this whole process of themes and features, all of it involves work. It's active. Think, think, think, think, think. Look, look, look. Like, like, like, like. Dislike, dislike, dislike, etc. It's all active—I'm doing it. Actually, after a few hours of this I feel quite exhausted and I need to take a break.

Not holding on to themes and features is just relaxing. So this practice focuses on the work required to maintain this entanglement. It's active. It's energetic. It's too much work. I'll just let it go. I'll just drop it and relax.

So we learn to receive whatever comes through any of the six senses. Accept it. Relax. Let it go.

This practice is one of not doing anything, and what I discover as soon as I start to do it is that the determination to do something with the experience is really strong, so it keeps coming up. But as soon as it comes up, I recognize the doing and I drop it, and I just relax. Does that make sense?

So this is what we're going to play around with, with just three of the senses. Now we're doing this according to Buddha's instructions, so it's not meditation. So do not take up a meditation posture.

You can stand, sit, walk around, lie down—basically do whatever you like. I'm restricted to this area because I've got the recorder, so I won't be wandering around. And also, do not close your eyes because we're going to work with seeing. It's difficult with your eyes closed—you kind of miss a lot. Some people like to look out windows and whatever. Basically, we're not meditating, so just do anything.

And relax. Just relax. Don't be doing anything. Just relax.

Open your awareness to the body. Don't work to focus on any particular part of the body. So just feel the body. Maybe the body awareness is kind of moving around. Let it move around, just spontaneously. Just feel the body. Don't do anything. Just be here.

When you feel awareness moving towards an object to do something with it, relax. Don't do anything. Just be.

Are you seeing? Bring awareness to your eyes. Relax your eyes. Receive sights. When you find your awareness moving towards something to look at it, relax. Come back to your eyes. Don't look, just see.

Are you hearing? Bring awareness to your ears. Relax your ears. Receive sounds. When you find your awareness moving towards something to listen to it, relax. Come back to your ears. Don't listen, just hear.

Are you thinking? Bring awareness to your mind. Relax your mind. Receive thoughts. When you find your awareness moving towards something to think it, relax. Come back to the mind. Don't think, just know that there are thoughts.

You can go back to meditating now.

Katie, you look exhausted.

"It is extremely difficult. That's quite a common reaction."

"I thought if you hadn't told me to do it, it was the middle of the day, dead smack, I think. But it isn't. Getting the effort right is... Did you do any sloth and torpor?"

"I didn't, but I realized that's not quite the point. So I resumed this, but the not doing of things is quite difficult for me anyway."

Anybody else? Anybody else have difficulty?

"I noticed a little reluctance at some moment when I saw something and I had the impulse to go there, and I thought, 'No, I'm not supposed to do that. Let it come to me.' So I didn't have the experience of going to the thing, and that felt strange. But I was a little... I wanted to do it."

It felt like a loss not to do it. And I had a sense—well, that's my thing. You know, that's what I do. And I can't do my thing. Anyway, I could simulate it with that feeling from waking up, from sleep to waking up. When you're slowly coming up from sleep. Yeah, that's the only way I could manage it. The mechanism of the eye, because I was lying down, always wants to get a depth of focus on something. It's sort of the way the thing works. So I had to sort of simulate a kind of blurry, relaxed eye.

When you say you simulated it, does that mean you were doing it?

I was doing it, yeah. But if I hadn't, I would have focused on something. If you hadn't done it, you would have done it—you would have done something else. That's one of the things about this exercise: it is so hard to drop doing.

I have seen this as well. It's so automated to, like you said, pull focus on something. But with hearing and thinking, I train myself to be able to sort of—I think—just let it kind of roll in without having to attach to things. So it's difficult to do it with sight, but the hearing and the thinking was easier.

Easier. And that's, you think, because of prior training? Or maybe because of the mechanism of sight and what it tries to do.

So you're not sure, in other words.

Yeah.

When I did a retreat with Sayadaw U Pandita many years ago, there was a riddle he kept posing that I didn't quite get at the time. He was saying something like, "What is it when the mind doesn't go out or doesn't come in?" As far as I understand it now, it is what we're talking about. It's not going out, going onto anything. It's not coming in internally. That does describe what we were exploring, by the extent we manage to do it. But it wants to. It definitely wants to. One or the other.

Did anybody find a sense of ease?

Yeah.

Tell me about the ease.

Well, I started by accessing my inner lazy sloth. And every time an object would come up, I'd think, "Oh, I can't be bothered." And it would be as clear as clear. And I'm like, "Oh, I can't be bothered. I'm just going to chill." And then I thought, "No, I can't even be bothered to chill because that's doing something." And so, you know, I thought, "Oh yeah, not doing, just being." And yeah, that's all right. It was very relaxing. I feel very relaxed.

Good.

I found the hearing easy because I've got really strong tinnitus. I've just trained myself over the years not to go there as a meditation object. But the other senses were harder.

What about mind? Not thinking, but just knowing that thoughts are there. How did that go?

That was the easiest.

That was the hardest for you? What was the easiest for you?

The headless way kind of thing, and it just flows where you're just aware—it comes through you.

It's interesting that each sense modality is easier for different people, probably because you've been practicing it. I suspect you've been practicing it with thinking, hence easier. But it's difficult when we're not used to it. Like anything else, we can train ourselves. But the thing about this particular form of training—it's a training in not doing.

And when I do not doing, basically what I do is I set myself the task of noticing any doing. It's like I seek to become sensitive to activity. And as soon as I notice it, I let it go. Like we were talking about this morning with stretching. And sometimes I can and sometimes I can't let it go. But the project is: notice activity, notice doing, and when you notice it, relax.

So it's a constant letting go and relaxing. The awareness becomes, in my experience, very acute because the mind and the senses are constantly doing. It just becomes very clear. I find it especially interesting in the mind.

We did this as I said—don't meditate—because I'm presenting it partly the way the Buddha presents it. But I also do this as a formal meditation practice. I will sit down in the meditation posture and my project will be to sit there and don't do anything. And as soon as I notice myself doing something, drop it, relax.

I find—actually I found this here—when I start doing this practice, I become acutely sensitive to posture. Because if the posture's out, the body's tightening. It's working. And I become aware of that. The only way that the body can relax is if it comes back into balance and then can relax. So I find this practice makes me very much aware of posture, because that's the only way that the body can minimize its doing—by being balanced.

When I move, if I do this in walking meditation, the movement tends to become graceful for the same reason. There's minimum doing in the movement. Mind becomes peaceful because there's minimum doing, but it's not a particular samadhi state because I'm not trying to do samadhi. I'm not doing anything. But everything starts to calm down, and it's a wide open kind of awareness, which I find quite interesting.

"So if something grabs your attention, like with the looking, I was scanning the room, trying not to look, and Buddha, every time I passed, grabbed me like the impulse was there. Look! So it's like catching that before it happens?"

You catch it when it happens. It's like you notice the activity of it. What you focused on here isn't the object, but the activity, the work involved. So it caught me and said, oh, no, we're not doing that. So you might keep your eyes in the same direction towards the Buddha, but you just relax. And it does come out as a soft focus that people often experience. Sometimes people say the eyes go out of focus, but certainly the focus becomes soft.

Sometimes people say, for example, looking out the window, when they look, everything's quite clear and sharp, but with this, everything becomes a bit blurry because they're not... Yeah, and that's another thing which can happen. Peripheral vision becomes more open.

"It strikes me, Patrick, that we are doing this in our practice anyway, and maybe that's part of the reason why we get more energy. After a while we get that really very clear sort of energy which to me is different from any other energy that I experience."

Yeah, this is like we're picking particular aspects of attention and how the mind is structured and just working on that particular aspect. We're doing this consciously, whereas it's kind of in my practice.

"I think one of the difficulties I had relates to something that Marion said, when she said, do we do it before? And you said, no, you catch it when you do something like that. I think I was trying to prevent it."

Yeah, so you were actively trying to prevent action. You were doing to prevent doing, which is, of course, another form of doing. But it does show you how deep the doing goes. "I'm not supposed to be doing, so I better do this." So it becomes incredibly complicated. And sometimes people do experience this as just being mind-bogglingly complicated. But it's complicated because we haven't let go of the doing. Once you let go of the doing, it's like, ah, there couldn't be anything simpler.

You can use this as a formal practice, and when I read about these advanced non-dual Mahayana approaches, usually this is what they're talking about. But it's also very good for daily activity, where you're not doing a formal meditation practice and there's nothing to do except—let's say I'm walking from here to the hall—there's only one thing I have to do and that's to walk from here to the hall. But if I'm paying attention, I notice actually that's not enough. The mind, the senses have got to do lots of other things along the way.

Well, actually, I don't have to do any of that. I can just relax and walk to the dining hall. That's it. Nothing extra.

And when I notice the determination to do something extra, oh, no, too much work. Can't be bothered. Drop it. Just relax. So it's quite simple. It's radically simple. And when you hit it, it's really nice because it's just relaxing. I just don't have to do any of this.

But it's tricky because I find myself trying to do this. It sort of clicks in on a long walk sometimes. Absolutely. And it's all just moving through space. Something is. That's how I feel after a retreat—I'm just walking around, not having to meditate. So you can relax the effort, but all of those mental qualities you're cultivating during the retreat, they're operating. So it's like you're getting the afterglow. But here, it's like try to tune into it during the retreat.

And you notice that—I've been talking about how the Buddha presents this before meditation. I've waited a week before presenting it because it's easier to get a sense of it when you've had the momentum built up through the practice.

The context that the Buddha talks about with this is especially with the alms round for the monks and the nuns. So the monks and the nuns ordain and they go off, they live in a sheltered workshop where they can focus on their meditation practice. But the way the Buddha set the system up is once a day they have to engage with lay society. And so that's the danger time.

When you do that, don't just relax. You're not trying to push the evil lay society away. You're just not getting involved. You just relax. Which is very interesting. Faced with sin and temptation, what should you do? Just relax. Sin is just too much effort.

That's a very interesting teaching. Lucky you. That's the secret of my virtue—a lazy man's virtue.

It's strange to be receiving and not to be saying thank you. Thank you. Oh, actually, no, don't put that in my bowl. You're not supposed to do that. Just receive it. Don't look at them, don't say anything. I find it very, very odd being on that. It's very interesting.

And that's the other thing. When sensory restraint is presented in meditation retreats—the way I've worked in Zen and in Theravada—it's being presented in the context of a retreat in exactly the same way: don't look around. Keep your eyes down. Don't listen to anything. Create your own little bubble and stay within that bubble. And this is sensory restraint.

Now you notice that's not the way the Buddha talks about it. Sure, open up. Look around. But don't do anything with it. It's different.

You're not trying to shut anything out. You're open to everything, but you're not going out to get involved. Because as soon as you notice yourself going out, ah, too much work—drop it.

A student asks: "Is the term 'choice-less awareness' used by Buddha?"

No, that term was invented by Krishnamurti and then taken up. It became very fashionable. But the term itself comes from Krishnamurti. Though you can see that this is where it's coming from—it's closer to that, yes. It's not quite that, but it's getting closer.

That so-called definition of mindfulness is really a very good definition of a particular style of meditation practice. And that's the other thing about these very simple practices. Sensory strength, also *sampajjana*—clear understanding—which the Buddha associates always with mindfulness, and which if you're in a Mahasi-style meditation retreat, is again very basic. But mindfulness and clear understanding the Buddha will also talk about in terms of being a very advanced practice in some suttas.

And basically it's the same practice. The simplest basic kindergarten practice, the most profound advanced practice—it's in fact the same practice. It's the same practice all the way through. It's just that we get better at it, basically. But it's the same practice. You get able to wring more out of it—squeeze more out of it.

"It's interesting that it's referred to as sense restraint, and yet it's actually sort of enhancing everything."

Because what's for the Buddha the sense—well, it's actually the *indriyasaṃvara*, the restraint of the faculties. Here "the faculties" is translated as sense restraint, but actually it's faculties. But these faculties in this context are the faculties of the senses.

Now if you look at this word *indriya*, it's derived from Indra, and Indra is one of the old Vedic gods. And he's the equivalent of the captain coach of a footy team. Indra is a war god. And he lives in this big castle in the sky. And he's a big, buffy bloke—think of rugby league.

And he gets up in the morning, and what he wants is a bit of biffo. So he gathers his mates, and they're all in the castle, and he's the leader. They leap on their horses, put on their weapons, and they charge up looking for a fight. And fortunately the Asuras are there, all geared up and ready to go. And so they spend all day hacking and bashing and biffing and attacking the Asuras, and they win. Every day they win.

So they're really pleased, and they go home, and they feast, and they eat, and they drink, and they party, and then they crash out. And then they wake up again and—let's do it again! And this is Indra's life. But he leads from the front.

So an *indriya* is an action, an activity that leads from the front, that's going forward. So you have the *indriyas* of faith, energy, mindfulness, concentration, wisdom—the five *indriyas*—because these are the mental qualities that go in front towards awakening.

And the Buddha says—and this is the aspect of the senses that he's looking at—this idea that the senses go out, they head out to engage, and that's the aspect of the senses that's being restrained. So it's the restraint of the action of going out. There's no English equivalent—the intention is bound up with it, intention, activity, effort, the whole thing, the active aspect of the senses.

So it's not that you're trying to shut down the senses, but the senses have two aspects: the going out and the receptive. If you drop the going out and you just have the receptive, it is an opening out. And because you're paying attention to that, it becomes even stronger. There's that expression: keep your eyes peeled.

"If one's restrained successfully, would you say the result is a little bit like equanimity?"

Equanimity. Because first of all it's regarding all constructions, all formations—because it's all the six senses. And reactivity drops away because all reactivity is action, is activity.

So it's also... I would imagine the Buddha spoke about it as a protective measure. He says "guarding the mind"—non-harming of the self. And it involves mindfulness. Your mindfulness has to be really good to do this, or alternatively, when you do this you really cultivate mindfulness strongly. But of course if you cultivate mindfulness you cultivate equanimity because they go together. So it's closely associated with equanimity.

This is very similar to what we find in the Satipatthana Sutta, where the Buddha speaks of guarding the sense faculties. The way he's expressing it here is like what he's explaining to people when they're just starting out with it. But as I often point out, in different contexts it's really the same practice but talked about from different angles and developed to different depths. The practice itself is the same, but you can talk about it in different ways depending on context.

It's definitely mindfulness. When you look at what he says—if she left the higher faculty unguarded or unprotected—when he talks about mindfulness, he talks about the function of mindfulness to guard, to protect. So mindfulness is implied. "Unwholesome states of longing and sorrow might invade her. Surrendering longing and sorrow for the world, she leaves tracking bodies." It's the same expression.

So that tendency to go for something is craving. This practice really puts you right in touch with craving. It's right on the edge—it makes craving really evident. I've got all this vision now, these hordes of galloping energy, galloping out through all my sense doors, being all very excited and looking for something. We definitely want drama. I mean, why else are soap operas so popular? You've got to have a bit of drama.

The sequence goes: contact, which includes vedanā, and then craving, and that's where your action is. Contact, vedanā, craving. But vedanā comes with the contact. So the contact's there, but this practice is about not acting on the craving. The non-doing is actually between the feeling and the craving—a non-acting on craving.

When the Buddha talks about craving, he talks about its restless quality. If you look at craving, you notice how the mind will move from one thing to another to another—this, this, this, this, this, this. What's consistent throughout is what I call a sense of urgent necessity which accompanies craving, but the object of craving is constantly moving. I want this, I want that, changing. So craving has this restless energetic quality to it.

Here you're addressing that not in terms of the object of craving but in terms of the energetic feel of it. And you're bringing in your dharmic laziness. It's like it's just not worth the effort.

Just relax.

This approach gives us a chance by recognizing this faculty and sense in the moment when we can actually intercept and do something skillful. Once you settle into this practice, all of these different qualities—these different mental factors—can become apparent as playing some part in the unfolding drama of experience.

In practice, each individual meditator will notice different aspects. One meditator might notice the cetanā, the volition, and then it becomes a cetanā exercise for them. Another meditator might notice the vedanā, the feeling tone, so for them it becomes a vedanā exercise. Another meditator notices something else entirely, and for them that defines their particular exploration. But all these factors are present and playing their part in every moment.

I recommend this to you as a daily activity practice, and also, if you want to explore it as a formal sitting practice, it's quite interesting. Of course, you can do exactly the same practice in both contexts—formally and in daily activity. What we're doing here is presenting possibilities. This is one possibility; it's not compulsory. If this doesn't appeal to you as something worth exploring, don't bother with it. Just keep doing what you're doing. But if this feels like it could be useful or interesting to investigate, go ahead and explore it.

Someone asked about the exercise we did yesterday, where we were looking at the movement of awareness as objects came into awareness: "Is that doing? Because the awareness does move from object to object."

In both cases, we're simply letting it move. Like yesterday, we maintain a posture of attention and just allow the awareness to move naturally. This current practice is very, very similar. Maybe in practical terms you can't tell the difference, and that's perfectly fine.

This points to how our training often works—we're always uncovering what previously we had not seen. In yesterday's exercise, you were doing that by having this project: "I'm going to notice that movement. I'm going to notice when awareness goes somewhere." It becomes a matter of "Ah, gotcha. Gotcha. Gotcha." It's a very interesting exercise because it's making you sensitive to those movements.

The day will come when you don't have to make such a deliberate effort. You won't need to think "Gotcha!" You'll just see it naturally. It'll simply be obvious. But when you start, it's necessarily a deliberate project. You're training yourself to notice these subtle movements. As people were sharing yesterday, they could do it in one sensory modality but not another, because they had practiced with that particular sense door before. When you practice something, it becomes natural.

One person mentioned, "The thing that really distracts me is sounds. My mind immediately goes to 'What was that? That's a bird' or whatever." If you practice this approach specifically with sound, those sounds begin to relax their grip on attention. You might choose to practice just with the auditory sense door and not bother with the others, because sound is particularly problematic or particularly interesting for you—it stands out.

Another question arose: "If you're doing this with mental formations—images and thoughts coming up—and you're not noting them, you're just sort of letting them be, how can you not get attached? How can you just let them be without doing vipassana?"

Well, perhaps that letting-be is vipassana. Maybe it's a non-active form of vipassana. When you're not getting entangled with the mental formations, they don't take on a life of their own.

This brings up an interesting point: How many of you felt that you could successfully relax the mind? And how many thought, "What does that even mean?"

I find this question fascinating. Mind is a sense activity—it's a sense door with its corresponding sensitivity, but it also has its corresponding activity. If there's an activity, it should be possible to relax it.

So can I relax the mind? Relaxing the other senses is also relaxing the mind. I had this moment where I looked at Blake's notes and I just dropped it. That was a mental thing. It was a visual thing, but also a mental thing.

With relaxing the eyes and the ears, they have location. So you can find them in order to relax them. Bring your awareness to your eyes—I know where they are. But where's the mind?

A student asked: "In this receptive awareness, is there also space for occasional light naming of things?"

Yes, if you want to. You reduce the floundering, you work out your own way of doing it. You don't obey orders. This is a different way of relating to the experience, and once you start to play with it, you start to modify it according to your circumstances—how you can actually explore this and what you can do with it. It's much more important than rigidly following orders.

"But isn't sort of a bit of... Naming feels like doing something."

It is doing something. But it kind of just stops the chaos just for a moment, slows it all down.

Buddha has the expression "using a thorn to extract a thorn." So in this case, using activity to drop activity. It's right effort. It would be an example of right effort.

Another student shared: "The first two exercises, I felt like I had some understanding of what we were doing there, but I was aware of the commentary in the mind all the time—how I was doing it right. Even when I felt the gaze was soft, still that commentary all the time in the mind. So then when we came to the mind, commentary is still there about the commentary."

In that case, you might want to just do it with the physical senses. Keep it simple. So you get a feel for it in the physical senses. Once that's established, you might be able to do it in the mind as well. Because as René was pointing out, you actually cannot relax the physical senses without relaxing the mind. The mind has to relax when you're relaxing the senses. But you might just stick to the physical senses and not worry about the mind until you get a clearer sense of what's going on. Just let it run—too much effort to try to get rid of it.

"I'm not trying to be too theological, but doing nothing is doing something, isn't it?"

You could say that, but that's alright. Circular.

"I often forget the names of things and I've always wondered whether it was dementia or not. I don't think it is dementia because it's always been this way. I can never remember the names of people or things. But when I'm meditating, sometimes I'll try to think of something. There'll be a thought that comes up—what's that name? And I notice an effort to try to remember the name. And I literally let it go. And maybe that's reinforcing my condition. But it's that practice of letting... There's an urge, there's a desire to want to know the name or something. I notice the urge and I let it go."

That urge to name is really fundamental. And in fact, one of the terms the Buddha uses for mind is nāma, which literally means "name." It's the process of naming an experience.

So nāma-rūpa... Rūpa is form in its original sense of visual form—how something appears to the eyes. Ajahn Sujata's translation of nāma-rūpa, which I think is sheer genius, is "named appearance." So something appears and we name it. And that's what we're doing all the time. Often it's translated as "name and form." Sometimes the old translation was "mind and body," but that misses the point.

Not being able to know what something is leads it to fall into the neither positive nor negative category, and then it just agitates. There's that challenging quality—it's so difficult to simply say you don't know. We want to give it a name, even a placeholder like "imponderable," because not knowing is quite agitating.

Someone asked: "Does this mean that as you get older, the imponderables increase?"

Yes, they do. I'm reminded of a koan where the abbot is saying goodbye at the end of a retreat—they have three-month retreats, and then the monks scatter. He was asking each departing monk, "Where do you plan to go?" One of them replied, "I don't know." And the abbot responded, "Not knowing is most intimate."

That's the flip side of confusion—the intimacy of not knowing.

When Emperor Wu of southern China was interrogating Bodhidharma, the emperor asked, "Who are you?" Bodhidharma replied, "Don't know."

There's that famous Korean Zen teacher who went to the USA—Seung Sahn Sunim. He would say, "Just keep that don't-know mind." But you can't maintain the don't-know mind until you actually reach it. Getting to it can be quite a journey.

I think it was he who kept asking "What is this?" throughout his meditation practice, right to the end. He claimed there was no other meditation—only "What is this?" This is one of the basic koans used in Korea, one of the most popular koans in the Korean tradition.

Thank you very much.

CHAPTER 16

The Insight Chorus - Part 2 - Independence

Patrick Kearney · 57 min

> *Patrick Kearney continues his exploration of the insight chorus from the Satipaṭṭhāna Sutta (MN 10), focusing on the profound final sentence: "she lives independently, not clinging to anything in the world." This talk examines what true independence means in Buddhist practice - moving beyond the conditioning factors of desire (taṇhā) and ignorance (avijjā) that keep us bound in cycles of seeking and dissatisfaction.*
>
> *Drawing on the Buddha's teaching of dependent arising (paṭicca samuppāda), Kearney explains how our sense of self and reality depends entirely on supporting conditions. He explores the concept of "unlanded awareness" (apaṭiṭṭhita vijñāna) - consciousness that doesn't depend on or grasp anything - using vivid analogies and references to both Theravada and Zen traditions. The discussion includes practical guidance on uncovering our deepest patterns of clinging through mindfulness practice, and how to cultivate the radical uncertainty that allows genuine awakening to emerge.*
>
> *This dharma talk offers both philosophical depth and practical wisdom for understanding how liberation manifests as a completely different way of being in the world - one characterized by complete freedom from the need to grasp or control experience.*

Last night we started on the insight chorus of the Satipatthana Sutta and we got through three sentences and tonight we'll do the fourth.

So what we did last night, the Buddha says, in this way she lives tracking body as body internally or she lives tracking body as body externally, or she lives tracking body as body both internally and externally. So here we see the weakening of the basic self-other division.

She lives tracking the nature of arising as body or she lives tracking the nature of ceasing as body or she lives tracking both the nature of arising and the nature of ceasing as body. So this is the perception of impermanence. And of course along with that comes perception of dukkha and of not-self. So the development of insight.

Further, her mindfulness, there is body, is established just for understanding, just for continuous mindfulness. So then you get a clear, direct intimacy with the experience which is continued over time.

And then the final sentence, and she lives independently, not clinging to anything in the world. So this is what we're looking at tonight. And this final sentence, she lives independently, not clinging to anything in the world, indicates the maturity of the practice and the maturity of the realization of the awakening itself. And you notice again, it's about a way of life. She lives independently. So this is not just about some kind of meditation experience. This is a whole way of life. And the not clinging indicates the sense that there's nothing further to be gained from anything really.

So let's have a look at what this idea of independence involves by looking at what happens before independence. And there are two major conditioning factors. The first is desire.

Why do we practice? Why do we take up any kind of meditation practice in the first place? Well of course it's because we want something. In other words, we are not satisfied with what we have now. We're not satisfied with this current situation. We want something better. Otherwise, we wouldn't bother. So we make effort because desire is the basis of effort. This is something that the Buddha is quite clear about.

Now, the way this works out is what we've talked about before, that our relationship to any experience, but you can certainly see it in the course of the meditation practice, is dominated by a sense of what's in this for me? What can I get out of this? And what's underneath that is a sense of things are not good enough yet. So we have an instrumental relationship to experience. We're constantly trying to massage it and manipulate it to make it suitable for our purposes. And there's always a gap. There's always something missing. There's always something more we need to do. And this is a relationship to the practice and to life that's dominated by what the Buddha calls tanha and avijja. Tanha is usually translated craving, literally it means thirst, and avijja is ignorance or delusion.

Along with desire, of course, there's also time. When experience is dominated by a sense of something to be gained or something to be lost, then time becomes real. We find ourselves resisting what's happening now because we're convinced that what will happen later is going to be more important or what did happen before was more important so we don't fully commit to the present because what's happening now is just a prelude to something more important that will happen later when I finally get what I want. And this means that what's happening now can be dismissed. If I've judged it as not good enough, then I can just forget about it. I'll just forget about it today and start again tomorrow. Have you ever thought that?

But when we are entirely intimate, then this experience now, whatever it is, is already enough. There's nothing more to gain, and there's no thought of anything that's going to come later, or even anything that did happen before. Any felt sense of past and future dissolves.

Now this doesn't mean that we don't think of past and future but in the very act of thinking about past and future it's perfectly clear that this is just a thought and it arises now. And there's the world of difference between a thought about the past or the future that arises now and being lost in the fantasy of past and future. And when that perception develops even any concept of the present dissolves.

And at this point there's no possibility of wanting anything else because there's no sense that anything alternative to this is even possible. It's just ridiculous.

Now here we're getting into the area that the Buddha calls, in this context, independence—in Pali, anissita.

So let's get a sense of independence by first looking at what the Buddha means by dependence, which is nissita. Nissita means dependent on, attached to, supported by.

This again comes out of the Buddha's fundamental assumption, his fundamental framework of dependent arising. This states that whatever we experience arises because of conditions other than itself. So if something is happening—which it is—there must be something else which conditioned it to arise. Otherwise it wouldn't be here. So this, which is happening now, is dependent upon, supported by, these other conditions. Take away the conditions, this collapses.

You might be having a satisfactory meditation and you might be convinced that finally you've got it. This is it. Now I know exactly how this practice works. There's no problem whatsoever. I've conquered it. And just at that moment, the door swings open very noisily and a guy in boots walks in and says, "I've got to look at the heater. Could you move?" And suddenly it all collapses. Because the conditions that supported it have just vanished. And with that, the experience vanishes.

This lesson is useful, especially for experienced practitioners. People, as their practice develops, might go through very difficult emotional situations where what we could call trauma arises in the heart, in the mind. It completely knocks us out and we stagger up a couple of days later and continue the retreat. We seem to get over that. Years go by, that's gone, and we think, "Phew, cleared that one out. I'm over that." And then suddenly—bang—it's back again. Haven't seen this for five years, ten years, fifteen years, and bang, it's back again, just like it was.

It's easy to think, "Oh, I haven't really made any progress," or "My sense of progress is an illusion." Well, it is, insofar as I think it's mine, but basically it's just conditions. If the conditions are such, the problem does not arise. But if the conditions are something else, it arises. It's actually got nothing to do with me. It's just conditions. That's all.

So this is the Buddha's basic framework—dependent arising. The reality of something, of an experience, is inseparable from the reality of what supports it.

For example, one area of experience that the Buddha is very interested in is my sense of self. I think I am real. In fact I'm pretty much convinced I'm real. Certainly sitting up here I feel real. Now I think I'm real in part because you think that I'm real. At least you treat me as if you think I'm real. So I think I'm the teacher here. I'm just quietly minding my own business up in the sunroom and people come in one after the other and they want to talk about their meditation practice. So I must be the teacher.

"Imposter."

Exactly, but don't tell anyone.

There's a friend of mine who lived in Japan. He said he knew someone—this woman who was another foreigner living in Japan—who would work in these Japanese companies, and she was very successful. But she'd work two or three years and then quit, and then join some other company, work two or three years and quit, and join some other company. She'd go through this pattern. About two years she would last. And once he asked her, "Why do you do that? Why do you quit every couple of years?"

I mean, it just causes trouble for you. And she says, "As time goes on, I get increasingly agitated and worried that sooner or later they're going to find out that I'm faking it. So I quit before they can."

And his comment on this was: she had a good realization into anattā, but the problem was it didn't go far enough. She didn't realize that everyone is faking it. So yeah, we're all faking it.

I think I'm real in part because you think I'm real. There's an external social support for the self. Also internally, my thoughts about myself. Each day I get up and I think about myself—who I am, how I got here, how it's going, how it might go in the future. And the drama of my life flows through my mind. This drama seems real, and the emotions associated with this drama seem real, so I must be real.

Then there's the whole thing about possessions. This nice classy Korean jacket—this seems real. And it's mine. So if this is real, and it's mine, then I must be real. This body seems real, and this is mine, so I must be real.

I'm caught up in this network, this incredibly complex network of experienced events that together create the sense of the reality of me living in this world. And all of those events are dependent upon, supported by something else. Without those supports, it would not be here. And therefore this sense that here I am in this world would not be here. So it's entirely dependent.

Does that make sense? So that's dependence. The opposite is independence—anissita.

Now how does the Buddha speak of that? In one discourse, the simile of the snake, he speaks of the citta, the heart-mind, of a tathāgata. And tathāgata—we talked about this maybe yesterday—is an awakened one. One who is in the state of gone to, come from: gata, tathā, just—just come, just gone, just is.

What is the state of the citta, the heart-mind, of an awakened one? The Buddha says: "When the devas, including Indra, Brahma and Pajāpati, seek a practitioner whose heart-mind is liberated in this way, they cannot get hold of anything that a Tathāgata's awareness depends upon. Why? Because a Tathāgata is untraceable right here and now."

So here he's talking about the citta, the heart-mind, rather than the body. The devas including Indra, Brahma and Pajāpati—these are seriously senior brahma devas. And devas have much more refined and powerful perceptions than human beings. They can perceive things that we cannot.

Now, they look for an awakened one. They've heard a rumor that there's an awakened one in the human realm. And so they go searching. And they cannot find the citta of the awakened one. They can find a body that's walking around, but they can't find the citta that animates this body.

Remember all those stories about Māra who comes and bothers the Buddha and other awakened ones? I think the reason why he did that was because he was really edgy and agitated because he couldn't find this person. There's the body, but where's the citta? I think it really bugged him.

They can't find it because such a citta is untraceable right here and now—because they cannot get hold of anything that the awareness of such a person depends on, is supported by. There's nothing that it depends on. There's nothing that supports it. So it can't be found. It can't be grasped.

I cannot grasp my sense of myself in the absence of those things that support it. But what if there's nothing that supports it? Then how can I get hold of this self? I can't.

One way of looking at this is that ultimately what it all comes down to are concepts. I think I am real. I believe I am real. I perceive myself to be real because I perceive this to be real, which supports me. I think this is real, which supports me.

So it all comes down to concepts.

And concepts involve language in the deep sense of how we name ourselves and our world. The meaning we give something, or the meaning that we give to something. So we trace ourselves and others through concepts, through labels, through language, through names.

But what the Buddha is suggesting is that an awakened citta, an awakened heart-mind, cannot be captured by any kind of language or concept or description. There's nothing we can get hold of to pin it down as something, as anything.

In the Atthiragasutta, the Buddha uses an image which I really am very fond of. He says: a roofed building or hall has windows to the north, the south and the east. When light enters a window at sunrise, where would it land?

So that's the question that he gives to the students. And of course, you all know the answer because it's pretty obvious.

"On the west wall, Bhante."

So the sun rises in the east. There's a roofed building or hall. It's got windows to the north, the south, the east. Light enters the window at the east. Where does it land? On the west wall.

"If there was no west wall, where would it land?"

"On earth, Bhante."

"If there was no earth, where would it land?"

"On water, Bhante."

This is ancient Indian cosmology. You have the great earth which is supported by the great ocean.

"If there was no water, where would it land?"

"It would not land, Bhante."

So "not landed" awareness is apatitita vijnana. And it's compared to light that doesn't land anywhere.

Now, in English we have a saying: "to see the light." But we actually don't see light. What we see is what light illuminates, what it lands on. So we gave the image of awareness is like light. I step into a dark room, switch on the light, and the room is illuminated. We don't see the light, we see the room. But the fact that we see the room means there is light. So the light lands upon the people, the furniture, the walls, and so we see what's going on.

What would we see if the light did not land anywhere? What would be available? That we have the light, the awareness, but it doesn't actually land anywhere at all. What can we say about such a situation? Does the light exist? Does the light not exist? Or does any kind of concept that we create about it fail? And if concept fails, what's left?

Now this term, "unlanded," is apatititta, and the same term turns up in Sanskrit as apratiṣṭha. And it's found as a technical term in the Mahayana. So it turns up in the Diamond Sutra, which is a key text for the Mahayana. Here it's translated as "unsupported."

The Buddha there says: "Therefore, Subhuti, the Bodhisattva Mahasattva should give rise to an unsupported heart. A heart not supported anywhere. A heart unsupported by sights, sounds, smells, tastes, tangibles or phenomena."

So the purpose of the practice for a bodhisattva, someone practicing the Mahayana, is to give rise to a citta which is not supported anywhere. Not supported by anything. Nothing in the six senses supports this heart-mind.

That's from the Sanskrit version of the sutra. In the Chinese version the same phrase is translated as "dwell nowhere and bring forth that mind."

So this is the "nowhere" that one is supposed to dwell.

Dwell nowhere and bring forth that mind. So live from that place of nowhere. And this phrase is very famous in the Zen tradition because when the young man who became the sixth ancestor, Huineng, was coming home to the village one day carrying firewood—since he made a living collecting firewood—there was a monk in the marketplace chanting the Diamond Sutra. When Huineng heard that phrase, bang, he got his first enlightenment experience, dropped his wood and headed off to the monastery.

So this is the unlanded awareness or the unsupported heart. This is something that is real, that exists, but it cannot be described. It cannot be captured by any concept.

Think about how description or concept works. I've got something, let's call it X, and I want to describe it. And so I do so eloquently, poetically, clearly. What I have is a network of concepts. What I don't have is X.

You might go home having done a meditation retreat and somebody asks you, "So what have you been doing for the past month?" And you might describe it very clearly. Would they know from that what you had done for the past month? No. That's why it's best to say things like, "Well, nothing much. Sat around. Did as little as possible, but it was hard. Went for a walk."

No explanation, no concept can capture the actual lived experience of anything. Similarly, the citta, the heart-mind of the liberated one exists—that is, there really is liberation—but it cannot be pinned down by any kind of concept. To recognize that, to actually live that, is the goal. To come out of that emptiness. How one lives that is the subject of much of the Zen literature. Of course, they play with this endlessly.

The koan I like to use to illustrate this is Case 40 of the Gateless Barrier, concerning a monk called Kuishan who was a disciple of Baizhang. Baizhang was one of the great early Chinese Chan teachers, and Kuishan was one of his disciples.

When Kuishan was with Baizhang's assembly, he was cook of the monastery. Now a cook in a monastery is a very responsible and very senior position. Don't imagine the cook is low down in the hierarchy. The cook is way up in the hierarchy. Otherwise they wouldn't be given such a job.

Baizhang wanted to choose a founding teacher for Mount Dagui. There's a nearby mountain suitable for a monastery, and Baizhang has been invited to create a new monastery. But he needs a teacher there—someone who will go there, basically camp out, attract disciples, attract money, build a monastery and spread the Dharma. He invited all his monks to make a presentation, saying, "The outstanding one will be sent." So this is an interview, a job interview essentially. An audition, a job interview. He's got to pick his best disciple for this job.

So he's going to be as fair as possible. He gets everyone together in the community and says, "Right, now we're going to pick the outstanding one among you." He took a water bottle, put it on the floor and said, "Don't call this a water bottle. What would you call it?" And he sits back and waits.

Imagine you're sitting there and there's this water bottle and you're thinking, "Okay, don't call it a water bottle. What do you call it?" Hmm.

Now, the top of the hierarchy is the head monk. The head monk runs the place for the teacher. He's second in command and obviously wants this promotion. He doesn't want to spend all his life playing second fiddle to the great guru.

He wants his own place. So he decides he's got to say something.

"It cannot be called a shoe," he declares.

Now generally at this point, if you're studying these stories, the Zen student sneers contemptuously at such a ridiculous presentation. But they're already primed to do that because usually the head monk in these stories plays the role of the idiot. But it's actually not a bad presentation.

What's the head monk pointing out? He's saying, "Okay, don't call it a water bottle. Fine. Obviously you don't call it a water bottle because you cannot capture this with concept. But you've got to be careful with concept. You can't just do anything with them. They have power. They can be dangerous or they can be useful. So you've got to be careful in terms of the way you use them. If you're teaching the Dharma, it's concepts, and you've got to be careful about what you say. You cannot call this a shoe, so you can't mess concepts up. Otherwise you create a mess, especially if you're going to be a Dharma teacher."

But Pai Chang was obviously not sufficiently impressed. So Pai Chang then asked Kuishan his opinion.

Now Kuishan is sitting there. Does he know that this is an audition? Does he know that this is a job interview? Does he not know? Is that why he's silent? Or is he silent because he knows that it is? At any event, he's called out. "Okay, your turn."

Kuishan kicked over the water bottle and walked out.

Pai Chang laughed and said, "The head monk loses."

Kuishan thereupon was made the founding teacher at Mount Guishan.

So—kicking over the water bottle and walking out. What was that all about? It's easy to read this as Zen anti-intellectual nonsense, kind of lawlessness, or do whatever you like. But it's much more than that.

Remember Kuishan's job. He was the cook. Now, it's a hungry community, and here everyone's been gathered for this really important meeting. There's no one in the kitchen. But who's responsible for making sure that the next meal arrives on time?

Kuishan. He can't fob it off on the kitchen staff—they're all at the assembly. Frankly, he hasn't got time for this bullshit. There are things to be done. So let's cut through the crap and do it. Kick the water bottle over, go back to the kitchen, make lunch.

And I think that's why Pai Chang laughed, apart from the fact that it was funny and made him laugh. What Kuishan was doing was just doing what needed to be done in the most simple, direct fashion. Just do it. And that's exactly the kind of person Pai Chang was looking for. And in fact, Kuishan did do it. He was sent off to the mountain and eventually developed a big monastery.

So this is one way that the Zen tradition plays with this sense of the unsupported heart, the unlanded awareness—but then how do you live from that? Beyond concept, not tied down by concept. Not the back story, but the forward story.

When Kuishan went to the mountain, it was apparently a very nice mountain, a very nice mountain with a flat area on top, perfect for a monastery. And Kuishan built himself a little hut and started meditating and waited for other people to turn up. And he waited. And he waited. And nobody turned up.

And eventually he thought, "No one's coming. It's a complete waste of my time." So he decided to leave.

He was walking down the path when suddenly he met a tiger. The tiger looked at him and growled. Kuaishan looked at the tiger and thought, "Hmm." He walked back to the top and returned to his hut, thinking, "Maybe I'm not leaving."

Not long after that, people started to turn up. It's an interesting story because the tiger is the spirit of the mountain. If you go to Korea—I don't know if it's like this in Japan—every monastery has a little shrine to the mountain spirit. The mountain spirit is invariably this old man with a long white beard, accompanied by a tiger. It's the tiger spirit of the mountain. So the spirit wouldn't let him go.

Part of the significance of this story, like many Zen stories, is that no description works. Performance works. Action works. But no description is adequate. These words about living independently, not clinging to anything in the world, are trying to convey something that cannot be described—something that can only be lived.

So it's futile to try to give a description. Perhaps a more useful project is to ask: How do we practice independence, rather than try to describe independence? How do we practice it?

The short answer is by not clinging to anything in the world. But if we're going to practice that, how would we go about doing it?

I think there are two fundamental movements. The first is to uncover our clinging—to uncover the point where we cling. Now, if we ask where we cling, the answer could be obvious. We all have problems, things we're stuck on. But it can also be very subtle. Sometimes the deepest clinging, the habitual clinging, we never see precisely because it's so habitual. Yet this is what pulls our strings.

Somebody said, "What makes a puppet a puppet? It's the fact that the puppet doesn't know that he's a puppet." That's the perfect puppet. We're driven by our clinging, and our deepest clinging we don't even know, because it's buried so deep. So the first thing is to uncover it.

One way to begin looking for it is by investigating our distractions. What prevents me—what prevents the citta from settling? What's getting in the way? Superficially we could say our distractions, but what that means is our clinging. The mind, the heart, is grasping, holding on to something. That holding is what gets in the way of everything settling down.

If the clinging is underneath the surface of consciousness, I don't see it, but it dominates and colors the felt situation. It's like wearing colored glasses—everything appears different. If I wear the colored glasses all the time, at some point I don't even notice that they're colored. I just assume this is the way the world is.

What we do when we practice is uncover our clinging. This involves ever-increasing intimacy, going deeper and deeper into the citta. When we find it, what do we do? Basically, we relax. And then, hopefully, we let go. The job is to let go of the clinging.

This is one of the reasons why the body work is so fascinating—because we can see this whole process in the body where it's much more obvious than in the citta, but the process is exactly the same.

In those stretches, find where it's tight. Find where the body in this movement refuses to go any further. That is the point of clinging. The mind is clinging to the perception that it's impossible to go further. Find that point and then relax. When the conditions are right, it gives way, and we go a bit further. There is a felt letting go.

So find where the holding is, rest the awareness on it, relax, let go. In the body work, we get a physically felt sense of that—of what the body feels like when we do it. This helps us feel it in the citta, where it's much more subtle, but it's exactly the same pro-

cess. Find the point at which there's a holding, the point that we cannot get beyond. Find it. Rest the awareness on it. Relax. Then at some point when the conditions are right, we let go.

When we let go, when we begin to inhabit the world of non-clinging, how does this world function? We're still in the same world that we are when we're clinging. There's still seeing, hearing, smelling, tasting, touching, minding. So we are in a world of experience, but we are no longer in a world of named experience. That's the difference. No concept works, and so the mind cannot pin down this experience of not clinging as anything at all. This is what makes it so subtle.

Later we might look back and name it: "Ah yes, that was not clinging." But having named it, that name, that label has already missed the labeled. It's impossible to jump over this gap between the actuality and the name we put on it. That gap is always there.

So ordinary life goes on. We see, we hear, we think, smell, taste, touch. But we learn to recognize that while our seeing, hearing, thinking, smelling, tasting, touching are real, what we see, hear, think is not what we think it is. This whole process of experiencing is real, but what I think I experience is not.

Our perceptions and our judgments of what we are sensing are wrong. All of them. They may be useful because they get us through the day skillfully, but they are wrong.

If all these perceptions and judgments are wrong, what's right? As soon as we reach out to put a label on something, to name it as something, to say "this is what's right," as soon as we do that we are clinging, and what we're clinging to is certainty. Only concept gives that certainty. As soon as we cling, then we're stuck and we're in pain.

But when we recognize that our label does not match, that the concept is wrong, then it's possible to relax back into that gap, that space of uncertainty. But to relax into it.

Normally our response to uncertainty is to tighten, freeze, cling, because we don't like it—it's uncomfortable. Not knowing is not comfortable. So we freeze and create a concept that we can hold on to: "Ah, this is what's going on."

But if we can relax into the uncertainty, it's a whole different experience. The gap between the concept and the reality stimulates our curiosity. "I don't know—then what is it after all?" So the investigation arises.

I walk into a situation that, conceptually, I've encountered dozens, even hundreds of times before. Because of that familiarity, I fall asleep. I know what it is, so there's no need to stay awake. But when I walk into that same situation knowing that I don't actually know what it is, then I'm awake, interested, and curious.

What arises is what the Buddha calls sati sampajanya—mindfulness and clear understanding. When we think we know, we fall back into habit. And when we are in habit, we are in our state of habitual clinging, and we are asleep. We don't know what's going on. We think we do, but we don't.

This is why I like to tell people that what gets in the way of meditation practice is not distraction. Distraction is the content of the practice. The barrier to practice—even the enemy of practice—is habit. When we fall into habit, we're asleep. We fall into habit precisely at the points where we think we know what is going on.

But when we genuinely don't know what happens next—and this is quite clear as a felt sense of genuinely not knowing what's happening next—then we're awake, alert, curious, and interested. Then we are truly doing this practice.

So that brings us to the final sentence: "And she lives independently, not clinging to anything in the world." In terms of how one lives, this is the goal of the practice.

Any questions or comments? Does any of that make sense?

"Can I just ask a question about the previous three sentences? The significance of 'or'?"

Ah, yes. With these terms—I forget what it is in Pali—it's like a verbal tic. It's just a way of saying, "OK, then there's this, and then there's this, and then there's this." It's a way to signal that this is the next item, and this is the next. I can't think of an English equivalent. I haven't gone into this deeply, but I think it's just an indication—"okay, then comes this."

"It just struck me tonight when you read it again, that it's saying 'this or this,' so I sort of heard it as more like you could just focus on internal sensation and reach the goal, not have to do any of the others because of the 'or.'"

I think the part about dependent arising is that there's a sense in which reality is modular. Once you're intimate with one aspect of it, all the others will turn up. It's like a multidimensional maze. Once we're in at one point of it, other parts will arise.

So let's say, for example, internal or external. I would say that for some people, their entry point would be the internal. But once they're in the internal, then everything else is revealed. But for other people, the entry point would be the external. Once they're in that, then everything else emerges. And so on.

So it's laid out in a very linear fashion, but I doubt that it is actually that linear. I think it's more dynamic than that. There's a sense in which the Buddha is laying out possibilities, and then the meditator discovers which one they're sensitive to.

You get a similar thing where sometimes he'll lay out lists of synonyms. There's one passage where he's talking about dukkha, and he says dukkha is a boil, a dart, a disease, a tumor, and on and on, listing about a dozen different descriptions. When I first read that, I thought, "God, this is tedious." But one time when I was doing intensive meditation practice and going through a lot of dukkha, I was reading it and going, "Yes, yes, no, no, yes, yes, yes, no, no, yes, yes, yes."

So it's about accessibility. It's presenting how different people experience it. Do you experience it this way? Then catch this one and go there. Some people come in this way, others that way.

I'm not quite sure about the technical answer to that question, but these are modular systems and they're not as linear as they appear when laid out. But if you're going to say something, it has to be linear. You say one thing first, then another thing, then another thing.

So concepts have this linear structure, but the reality doesn't necessarily match the linearity of the structure.

Someone asked whether there was any significance to the "or" that was used in the first three sentences—the word "or." "She lives tracking body as body internally, or she lives tracking body as body externally, or she lives tracking body as body both internally and externally." So does this "or" mean you could do this or you could do that?

You do both of them. All of them. So what's the meaning of the "or"? Because in reality you're not really going to see arising without also seeing passing away. Although one of them could be emphasized at certain points, there are some flavors of impermanence where it's predominantly arising. But you don't see one aspect of the process and not other aspects.

We haven't seen the arising of that distraction—no, by definition we're there at the moment of its passing. So it can be that's a situation where it's just the passing and not the arising. And then you get in the classical insight knowledges you have udayabbaya

ñana, knowledge of arising and ceasing, in which you see arising and ceasing. And then you have bhanga ñana, which is the knowledge of dissolution, where you just see the ending of things.

People have different experiences. One time here, in a summer retreat, one of the meditators was going through dukkha ñana. What was apparent was the universal characteristic of dukkha. She'd be walking from here to the house through the garden in summer when everything's blooming. She'd say partway through the journey, what she would see is everything beginning—everything blooming, life springing up out of the ground, everything new, everything fresh. And then suddenly everything dying, everything ceasing, everything falling to the ground and rotting. And then everything blooming. And it happens several times, just from here to the house. It's like one aspect of change, another aspect, another, another one. So you can get all sorts of particular views that may last briefly or they may last for a period of time.

Any other questions? Okay. Thank you very much.

CHAPTER 17

The Three Satipaṭṭhānas

Patrick Kearney · 1h18

> *Patrick Kearney offers a comprehensive examination of the first three satipaṭṭhānas from the Satipaṭṭhāna Sutta (MN 10), exploring how body (kāya), feeling (vedanā), and heart-mind (citta) form an integrated framework for mindfulness practice. He begins with the etymology of sati as "memory" or "remembering the present," distinguishing between sati-upaṭṭhāna (the activity of being mindful) and satipaṭṭhāna (what is remembered). The talk examines how body practice grounds awareness in the present through the five physical senses, with particular emphasis on tactile sensitivity's clarity and immediacy. Kearney explains vedanā as the affective dimension that moves us toward attraction, aversion, or confusion - the realm where ethical sensitivity begins to develop. He discusses citta as our general state or mood, comparing its natural luminosity to clear water that becomes disturbed by kilesas (defilements or "stuckness"). The three satipaṭṭhānas progress from gross to subtle while forming a triangle with vedanā as the apex - the key to intimacy with both body and citta. This exploration reveals how mindfulness practice develops from physical awareness through emotional intelligence to understanding the movements of the heart-mind that shape how we live.*

We've been exploring different aspects of sati and satipaṭṭhāna, and tonight and tomorrow night we'll review the four satipaṭṭhānas listed in the Satipaṭṭhāna Sutta: body, feeling, heart-mind, and phenomena. We'll examine how the Buddha presents this entire project as an overview.

First, let's begin with sati, which we've been discussing—usually translated as mindfulness, but literally meaning memory. It refers to the quality of presence or remembering the present.

We can understand what the Buddha is pointing to by examining distraction, because when the Buddha talks about the absence of mindfulness, we can recognize this in our experience of distraction. We can understand the meaning of presence by looking at our experience of absence and what it feels like.

When are we not present? When we are distracted. How does distraction begin? Suddenly we forget. This forgetting is the opposite of mindfulness. We forget the meditation object, or we forget to meditate—these are the two flavors. We have forgotten what is present, or we have forgotten to be present. Then suddenly we remember.

When we enter into distraction, the essence of distraction in this whole experience is that we don't know that we are distracted. The mind has slipped away from where we put it, and we don't know that it's slipped away. The universal experience of distraction is: I fall into it and I don't know that I've fallen into it. That not knowing is distraction.

Distraction is not the fact that attention has moved from one object to another—that's not distraction. The mind moves; that's what it does. Distraction is found in the movement of the mind when we don't know that the mind has moved. We don't catch the movement itself.

We come out of distraction at the moment we know we are distracted. As soon as I recognize, "Oh, I'm distracted," that very recognition is memory. I've suddenly remembered—I've remembered what is present (the distraction) or I've remembered to be present.

These two flavors are actually built into the word satipaṭṭhāna according to the mysteries of Pali sandhi—the rules governing the joining of words. The compound satipaṭṭhāna can be read in two ways: as sati-upaṭṭhāna and sati-paṭṭhāna.

If we read it as sati-upaṭṭhāna, it's the activity of being mindful—the activity of remembering to be present. The second way, sati-paṭṭhāna, is what is remembered as being present—what we remember.

You have the activity itself, sati-upaṭṭhāna, and you have what it is that we remember, which is sati-paṭṭhāna. The traditional Theravada favored this second reading, satipaṭṭhāna. That's why in the old translations, satipaṭṭhāna is invariably translated as something like "the foundations of mindfulness."

If you've been around these circles for a long time, you would know satipaṭṭhāna as "the foundations of mindfulness." But you might notice that newer translations are appearing, like "the establishments of mindfulness" or "the applications of mindfulness." These newer translations come from taking satipaṭṭhāna as sati-upaṭṭhāna.

In fact, this is what the Mahayana tradition has always done. In Mahayana Buddhism, they've always taken it as sati-upaṭṭhāna. Modern scholars have decided that in this case, the Mahayana got it right and the Theravada got it wrong. Even the Theravadans are accepting this—people like Bhikkhu Bodhi now translate satipaṭṭhāna as "the establishments of mindfulness."

We've talked about how the basic activity here is anupassanā—tracking experience over time, creating this continuity of mindfulness which we can recognize as the felt continuity of awareness. It's something I can feel, that continuity, and it's quite a powerful experience if we can maintain it for any period of time.

So we have sati-upaṭṭhāna as the trackings, the doing of the tracking, and sati-paṭṭhāna as what it is that we are tracking.

Tonight we're going to look into this second aspect—what it is that we are tracking. There are four aspects of experience that we're tracking: body, feeling, heart-mind, and phenomena.

He's referring to our capacity to hear, our sensitivity to sound. Similarly, the body in the narrow sense refers to our sensitivity to touch, to pressure, temperature, movement, texture—all the countless physical sensations that arise and pass away moment by moment.

This is where mindfulness of body becomes incredibly intimate and precise. We're not thinking about the body or analyzing it; we're actually feeling into the direct, immediate sensations that make up our physical experience. The warmth of breath at the nostrils. The weight of the body sitting. The subtle vibrations and pulsations that we can feel when we really tune in.

And what's remarkable is that when we do this consistently, we begin to discover that what we call "body" is actually a constantly changing flow of sensations. There's no fixed, solid thing there. It's more like a river of sensation, always moving, always in flux. This begins to challenge our normal assumption that the body is this solid, permanent thing that I own or that I am.

The second foundation is feeling—vedanā in Pali. Now this is often mistranslated as "feelings" in the emotional sense, but that's not what the Buddha is pointing to here. Vedanā refers to the immediate affective quality of each moment of experience—whether it feels pleasant, unpleasant, or neutral. This is something much more basic than emotions.

Every moment of sense contact has this quality. Every sight, sound, smell, taste, touch, and mental formation comes with this immediate felt sense of pleasant, unpleasant, or neither. It's like the emotional coloring of raw experience before we elaborate it into full emotions or stories.

This is actually a crucial foundation because vedanā is where craving gets its foothold. We feel something pleasant and immediately want more of it. We feel something unpleasant and want to get away from it. We feel something neutral and often become bored or distracted, seeking something more stimulating.

But when we can track vedanā with mindfulness, we start to see this mechanical process happening. We begin to see how our reactivity is conditioned by these basic pleasant and unpleasant feelings. And in seeing this clearly, we create the possibility of not being so automatically driven by our reactions to pleasant and unpleasant experience.

He's referring to sensitivity to sound. And this sensitivity is located in a particular part of the body. But he's not talking about the ear in a third-person sense. He's talking about the fact of sensitivity to sound.

A lot of meditation methods emphasize the body, but in particular the fifth sense field, sensitivity to touch. That's of particular importance because as a meditation object, sensitivity to touch has two major advantages, and both of them are linked to the clarity of contact.

First of all, body—which of course is actually all the five physical senses but particularly the fifth body—is now. It's just bleeding obvious that physical sensation is in the present. Thoughts and fantasies, where we usually live, they exist in time. It makes sense to remember the past. It makes sense to plan for the future in the mind. The body does not remember the past. It does not anticipate the future. It is now. A sensation, which is the only expression, the only language of the body, is always now.

So I can be completely caught up in some incredibly important reflection on past or future, and I'm so caught up in it that I don't notice the rock in front of me. My foot hits the rock, I come crashing to the earth. And when this happens, do I lie there, continuing to fantasize about past and future? No. I'm right here, right now. And of course this is why the sadhus love it when meditators report pain. When does pain occur? It always happens now.

So the body is radically simple and radically present. Every time I ground my awareness in body, I'm grounding it in the present, automatically, just by doing that.

And secondly, the body, this fifth physical sensitivity, is clear. We talked about contact and sensing. When we talked about the senses as faculties—remember restraining the senses—we saw how the senses will go out to engage in the world; they're active. This is the sense as an indriya, as a leading out.

But there's also a way in which we can look at the senses in terms of a receptivity. Something strikes the sensitivity. So sound strikes the hearing sensitivity. Light strikes the seeing sensitivity, and so on. And this impact is phassa, contact, literally touch. So we are touched by the sense contact.

And the later tradition says the touch of seeing, hearing, smelling, and tasting upon their respective sensitivities is like cotton striking cotton. The touch of a tactile sensation striking the body sensitivity is like a hammer hitting an anvil. Whammo! It's strong and it's clear.

So if I want to develop mindfulness, and the tradition says one of the things which encourages the arising of mindfulness is a clear perception, where would I go looking for a clear perception? Here. It's the obvious place. So this is why the body is so important in meditation practices.

First we have body, then we have feeling, vedanā, which we've spoken about a great deal, so we've just got to have a brief look at it. As we said, it's the affective or hedonic aspect of experience, and we can compare it to the flavor of the sense object. But its characteristic is what moves us; vedanā is what provokes a response.

So we are struck by sense data and in that impact, in that contact, there is a response. The citta is moved in some way. That movement, what stimulates that movement, is the vedanā, is the feeling. So this is the whole realm of affect.

And the three basic movements of the mind, as we've talked about: attraction, the movement of the mind towards the sense object, to hold on to it—"I like this." Aversion, the movement of the mind away from the sense object—"I don't want this," or even "I'm going to hit it over the head to get rid of it."

And the third one, the third flavor is, "I haven't even noticed it." Indifference. Or, if I notice it, I'm confused—I don't know what to do about it. Should I hold on to it? Should I reject it? Should I hold, reject, hold, reject? This is the realm of doubt and confusion.

So this second Satipatthana expands the practice to tracking our response to the experience. It's not just the experience itself. It now includes how we respond to the experience. What does the mind, the citta, do in response? This is all about seeing that we are moved and how we are moved.

And this takes us into the realm of ethics—in other words, how we live. Here, for these purposes, ethics can be seen as our response to the universal human question: how should I live? Each of us is faced with this question. What do I do with my life? How do I live? And over the years each of us has produced an answer to that question, which is how we in fact live, and all the choices we've made to create that construct.

This whole project begins with vedana, because vedana is the realm of that movement, that determination, this inevitability of reaching out: "Yes, I'll definitely hold that one." "No, I'll definitely reject this other one." "I'll just ignore this other stuff because it's not worth paying attention to."

So in vedana we enter into what we could call the realm of ethical sensitivity. We start to become sensitive to the things that create the way that we live. And this is something that we do not find in the first Satipatthana, in body. There's no ethical sensitivity in the first Satipatthana.

If you have any doubts about this, just study the sports pages—particularly rugby league players—and the constant series of entertaining scandals that sports stars manage to get themselves into. Often you're reading about someone whose body intelligence is very, very highly developed. Especially in team sports, because in team sports the people who are really admired are not just the ones who have this particular set of skills required for that game, but the people who know how to read a game.

In the chaos, they seem to have this intuitive sense of what the other team is doing—not simply what they're doing now, but what they will be doing in the near future. The ability to anticipate that the ball, which is currently over there, will be over here within three seconds, and therefore right now I should be heading in this direction. If you follow a team sport and watch these sorts of things, these are the magic moments when suddenly it all comes together—this group intelligence. It's just amazing.

So people can develop a great deal of intelligence relating to the body, but ethically be completely stupid. Totally.

And you see also—perhaps for this audience this is a bit more controversial; it's one thing to put the boot into rugby league, it's another thing entirely to mention—that you see the same thing in the world of yoga. We find people who have an acute physical sensitivity and can put their body in any position and move any little bit of it, and yet in their ordinary lives they're ethically as thick as two short planks.

From a meditator's point of view, you can develop an acute sensitivity to such things as the rising and falling of the abdomen, if you're a classical Mahasi meditator, and again make absolutely no difference whatsoever in the way that you live. Or I should say, we. We can master a meditation technique based upon body, and it might have zero effect on the way that we live.

Where that happens is in vedana. That's where this begins. Seeing that we are moved. And how we are moved. And what is it that moves us? And what's the result of that movement?

So something happens and I reach out and I hold. And I don't even notice until I'm already holding. But to see that movement—ah, when I hold like this, I usually end up regretting it sometime down the track. So maybe I should think about some alternative strategy here. And then we start to see changes in how we live.

So this brings us...

to the third Satipatthana: citta.

Usually translated as mind, but that easily gives the wrong idea. I find the word mind way too cognitive. One of the things that attracted me to Buddhism and Buddhist practice is that it was all about the mind. And being, when I was young, very miserable and very intellectual, I could find refuge in mind. So I would find refuge in reading books—esoteric books. They could take me out of the world of my problems. I could hide away.

And I could hide away in nice books about Buddhism. Because it's all up here. But that's good because Buddha says we're developing mind. And where is mind? Well, mind is up here. Isn't it? And what do we do with mind? Well, we think. Isn't that what we do with mind?

So I find mind is inadequate as a translation. Citta covers the realm of what we would call the heart. So the realm of feeling. Emotion, mood.

One—I think personally the best translation for citta would be soul. Soul. S-O-U-L. You're looking at me very dubiously. Okay. Not in the Christian theological sense, but in the original sense, in Aristotle's sense, the soul. Like the ancient Greek philosophers would debate about the anima. That's Latin, isn't it? I don't know what the Greek word was. But it gets translated into English as the soul. That, I think, would be the equivalent of citta.

But with Christianity, you get—for the ancients, the human being was made up of essentially body and soul. And then the Christians came along and they added a third dimension, spirit, that they put on top. So you get this tripartite thing where spirit becomes most important and spirit is completely non-physical. And it has to do with God and not much to do with tacky things like the body.

But for the Buddha, citta and body are intimately entwined. In fact you can't have one without the other. If you have one, you've got to have the other. If there's a mind, it has to have a body—it's necessarily part of a body. If there's a body—in other words, remember we're talking about experience—if there's the experience of body, there has to be mind because what's doing the experiencing? It's mind. And if there's mind, there has to be body. So I'm thinking about something and the thinking is definitely mind.

But where is the thinking taking place? Remember we played around with this. It's connected clearly in some way to body. If this body wouldn't be here, those thoughts would not be arising. So for the Buddha, body and mind are intimately intertwined.

Patrick, you're not happy with the term heart-mind? Yeah, that's the usual one. I go for the compromised heart-mind. And sometimes I'll translate it as heart, because sometimes that seems to be the best context. And I guess sometimes it's mind.

Soul—the problem with soul is you've got to explain it to everybody. And some people wouldn't be convinced. It's becoming accepted, but I think we're learning it from the Buddha. I think this is part of the cultural interactions that's going on.

Well, in Asian cultures, they have no problems about this mind being here. No, that's not like the Western European culture. It's not the same degree of separation. It seems to be uniquely European that made this separation.

Chitta is a key technical term in Buddhist teaching and in subsequent Buddhist philosophy. Depending on context, it receives various definitions. In the Satipatthana Sutta, it's not given a precise definition. The meaning is more general. It's basically used in a broad sense to indicate our general state—how one is at this particular time. So it's close to what we would call mood, though not quite mood, but quite close to that.

It's like our routine greeting where we meet someone and say, "How are you?" You could say that what we're asking about is the state of your citta. Usually we say, "I'm good." Are we doing that to reassure the person that we're not evil? Or are we doing it to reassure them that we're not about to tell them the tragedy of our life—because actually we feel really awful—and ask, "Do you want to hear all about it?" In other words, we basically evade the question.

But if somebody asked you, "How are you?" and you actually, as a meditator, went into your citta, felt your general state, how you are at this time, and then told them, you would be presenting your citta.

Citta is very similar to vedana. You could say that citta is how one is at this time, while vedana is how one feels at this time. They're very, very close. In fact, for practical purposes, you wouldn't even distinguish them.

It's important with these technical terms—they are precise, but their precision is the precision of poetry, not the precision of science. So there's always room for disagreement, particularly from the meditator's point of view. I'm experiencing something. Is this vedana or is it chitta? It basically doesn't matter which one it is. What matters is that we can make sense of the experience—that we can first of all develop the sensitivity so we experience at a degree of intimacy that we normally miss, and that we understand, have some understanding of what this is and how it flows, how it works. Whether we label this particular experience as "Oh, this is vedana" or "This is chitta" really doesn't matter.

"Patrick, my understanding of vedana is specifically about, as you said, the hedonic dimension—the liking, not liking aspect. Whereas to me emotion is much broader and more varied. If I feel anger, for example, it somehow partakes of not liking, but it's a very particular kind of not liking. It's much more complex. It's a particular flavor that isn't about either liking or not liking."

There's actually no word in Pali that translates as emotion. It's not part of the Buddha's vocabulary. In one of those Mind Life Institute books that came out of those meetings about destructive emotions—somewhere around page 300 and something—the Dalai Lama actually says, "By the way, there is no word in Tibetan that translates as emotion." As far as he knows, there is no what he calls "Buddhist language" that has such a term. Certainly you don't find it in Pali.

"Why do you think that is? Is that because maybe the emotions are on the dimension of faith?"

What these concepts do is divide the world up in certain ways so that we can understand what's going on. They're very culturally specific. If we go back to the ancient Greeks, they asked the question: What is it that distinguishes human beings from all other species? In particular, what is it that makes us superior? The answer they came up with was reason. Reason is the distinctively human characteristic of what we would call the citta. Now if you ask, "What's the enemy of reason? What could sabotage reason?" The answer is emotion.

So you have this reason versus emotion categorization, which becomes very important in European culture. Whereas the Buddha is looking at things from a different angle. First of all, he's very precise in his language. Emotion is too general. If I can recognize an emotion, if I can recognize, "Oh, I am in the grip of emotion X," in order to do that I need a number of different things. I need, for a start, some kind of narrative in the mind, a story I'm telling myself and believing. Let's say I am angry and I can recognize that.

I have to have a narrative in which someone did something, or didn't do something, is doing something, or will do something that they should not.

"Do you think you would just recognize the constellation of body sensations from past experiences that equate to anger, for example?"

Then that would just be a series of body sensations. There wouldn't be anger. It feels like anger. And you might then—actually if you say, "Oh this feels like anger"—watch the mind go into overdrive, heading for the filing cabinet, pulling out nasty things people have done, riffling through: "Ah, this one. This is it."

So you've got that. It's also in the body. If there's any emotion, the body is being stirred up, as you point out. It's being stirred up in some way. So you have narrative, citta, body, and of course you have vedanā. And the vedanā will either be pleasant or painful.

To me it makes no sense to talk about an emotion which, in the vedanā—the affective feel of it—is neither painful nor pleasant. It's either painful or it's pleasant, and usually strongly so. Or even both, going boom, boom, boom, boom, boom between them. As I've been assured by one crotchety old bachelor: love. It can also be painful and pleasant at the same time.

And also with emotion, I don't think it makes sense to say that we are always in the grip of emotion. But we are always experiencing vedanā. So I think partly the Buddha avoids this term because it's too general. He divides things up into their component parts.

And partly he doesn't come from this European heritage. For the Buddha, if he's looking at the human being, his major dichotomy that he's interested in is not "Is this reason or emotion?" but "Is this kusala or akusala?" Is it wholesome or unwholesome? Does it lead towards the cessation of dukkha, or does it lead towards the cultivation of dukkha? That's what he's interested in. So that's the basic binary that you find.

"I can't speak Latin, but I believe the Latin that emotion comes from refers to emovere, which means to bring into action, to make move, which is similar to what we're talking about. What moves us. But the Buddha does talk about will, for example, but that could manifest in a number of the emotions we categorize, such as jealousy as well as anger and resentment."

So the basic movement of attraction—the movement of the mind towards an object—could be addictive lust at one end of the spectrum and the highest ideals for humanity on the other, and everything in between. So the whole range of things, some of which are emotions and some of which are not, would be covered. And similarly with aversion. A whole range of moods and emotions and so on would be covered, would emerge out of that elemental movement. So they're in a way more general—general in the sense of elemental. It's like getting into the elemental quality of these things.

I think to the Greeks, emotion was also just like a category of non-reason. It's a big category of things that aren't reason. It's not so refined.

And this is one of the things when we read the Buddha: we've got to accept the fact that he's coming from a different culture and he's reading things differently from the way that we do. And our tendency is just to read him in terms of our familiar cultural categories, but when we do that, we get him wrong. We misunderstand what he's actually saying.

"Another thing to think about is that Western culture doesn't have clear definitions of emotion in science. But when it comes to states of mind such as peace or even compassion, there are arguments about whether that could be called an emotional state, saying, 'Well, it's not really emotional because it doesn't have this quality and so on.' So it's interesting variations in the way we understand what it means."

Even in Western language, we're not clear about it. And you can see that in contemporary psychology, the incorporation of mindfulness and grappling with this whole new vocabulary. People trying to work out how to talk about it.

I think English is a pretty poor language in terms of trying to actually describe nuanced states of mind. It just doesn't have very many words. It's quite poor compared to Pali and Sanskrit.

Anyway, citta. The essence of citta is awareness, vijnana. And the Buddha compares this to clear, transparent water. So the mind that is purified is compared to a mountain lake where the water is quite clear, limpid and undisturbed. This is the kind of citta that we're trying to cultivate when we do the practice.

And the Buddha says someone standing on the bank of such a lake could look into it and see the bottom of the lake, along with the plants, rocks and pebbles at the bottom, and the fish all swimming about. So the transparency of the citta is something that we're cultivating. And the essence of the citta is that transparency, which here is compared to water that is clear and still.

The Buddha also describes this essence of citta as luminous, pabassara. So he'll talk about the luminosity of the citta. And we talked about this in terms of it's like walking into a dark room and then switching on the lights—everything is luminous. It appears in the light. So this is the essence of citta, this awareness, this clear awareness.

But this essence is disguised from us by the disturbances that enter into the citta, the kilesas. Kilesa is usually translated as defilement. That's the traditional translation. Kilesa comes from—and except in... You notice in Mahayana Buddhism they'll talk about it as afflictive emotions. Have you come across that one? Now they're coming based on the Sanskrit klesha. And klesha can be kind of backtracked to kilesa, or it can be taken to a different root meaning "to afflict."

I've often seen "afflictive emotions" in English translations of particularly Tibetan works, but what they're doing is first of all they're adding the word "emotion" to make it culturally familiar. So if you drop that, kilesas are the afflictions. That's what afflicts, what pains the citta.

In the Pali, it's kilesa, and the tradition derives this word from the verb kilesati, "to stick, to adhere." So the image is, let's say you have white cloth—you've got a new white shirt and you're having a nice dinner and you're a messy eater. Then at the end of the meal, as you're wiping the food from your face, you look down and you realize, "Whoops, I need to change this shirt." The shirt is defiled, it is dirtied, because something from outside the shirt—bits of food—are sticking to it.

So kilesati is to stick, to adhere. So kilesa, usually translated as defilement, could also actually be translated as stuckness. It's quite interesting. Stuckness. Basically, you could say that one of the fundamental values of the Buddha is freedom. What gets in the way of freedom is when we get stuck. When I'm stuck, I'm not free. And this stuckness is kilesa.

There's the Wallace translation—I think it's the Sanskrit translation of klesha from the word "to distort." Kles means to distort. I think sometimes some people take on klesh and some people from klish. You've got to have klesh or klish. This is the thing about Sanskrit—you can play with it. You've got a word and you can say, "Well, I can derive this from this root or that root or the other root and make something out of it."

And we don't know whether for some of these terms the Buddha would have started at the root and then created a technical term. But in other cases, there would have been this term, and then the commentator goes back to the root. But depending on what meaning he or she wants to put on it, they just choose different roots. "Yeah, I can derive this from this root. It gives it a much more interesting meaning."

There is this creativity with language in the Indian traditions. They play with language. And I think the commentaries—the set of other commentaries—I would guess the same is in the Sanskrit. So Buddhagosa would say, "What does this mean?" and he'd give a list of different meanings, playing with the word in different ways. "Well, you can take it as coming from this, in which case it means that. Or you could take it as coming from this and then you get this other meaning. Or you could take it this way and get this other one." And it just goes down the list. And the thing is, it means all of them. And if you want to play with it some more, you can have more meanings. You play with it. This is part of the poetry of it.

If the citta is disturbed, this is compared to water that's mixed up with color, with dye, for example—so it's not transparent, you can't see into it—or heated until it's boiling. Anybody had a boiling citta? Or covered with algae, clogged, sticky, or stirred up by the wind, or muddy. And these are, of course, all images for the hindrances. So the natural transparency of the water is lost. But you notice that the natural state of the water is transparent.

And this is the basic insight from which you get in East Asian Buddhism the idea of Buddha nature—where this comes from. So the investigation of citta is fundamental to this practice. And tracking the citta develops a sensitivity to the state of our heart, of our heart-mind. We become present to our inner state, whatever that is.

This understanding entails knowing how we feel—vedana—and therefore how we are moved to respond, to act, the choices that we make—cetanā, the sankhāras or constructions we talked about before. When we're talking about what we do, how we are moved to act, then we're talking about karma—action—and vipāka, its ripening, the results of that. This takes us into how we create the way that we live. And all of this is accessible through citta. So citta is the key.

When the Buddha talks about bondage, what is it that is bound? It's the citta. When he talks about liberation, what is it that is liberated? It's the citta. So the tracking of the citta is, you could say, the fundamental aspect of the practice.

Part of it—a really important part—is becoming aware of the difference between the kusala and the akusala, the wholesome and the unwholesome. The wholesome is a response, an action, which is pleasant within itself and leads to a good result—good in the sense of lessening of dukkha, leading away from dukkha. Something which is unwholesome, akusala, is painful within itself, in its nature, and it leads to a painful result. Learning to distinguish those is really central.

And of course it's not at all obvious. If you look at the human condition today and realize that this is the result of tens of thousands of years of people trying to make the world a better place—this is what we've got. So delusion is very powerful. We can pursue something our life long, convinced this is what's going to make me happy, only to discover that it doesn't. And of course in terms of the pursuit of economic growth, consumerism, and so forth, this is both very obvious but somehow everybody who has any kind of power in this society seems to be totally blind to it.

So we can't take for granted that we know the difference between the wholesome and the unwholesome, the skillful and the unskillful. You notice you get these two different translations. Kusala, sometimes translated wholesome, sometimes skillful. Akusala, sometimes translated unwholesome, sometimes unskillful. Wholesome and unwholesome points to the quality of that phenomenon itself. Skillful and unskillful points to the results of it. So it's two different sides, but they include both.

Another aspect of tracking the citta is seeing how we construct ourselves. We're constantly selfing, constructing a self. When we become sensitive to the movements of the citta, we can see just how relentless this is. And then we can get a sense of: is this kusala or is this akusala? Does it lead to greater freedom and ease, or does it lead to greater bondage and pain? Once we see that, then we can start to make different choices.

Now if we ask, "Well, how do we gain access into the citta?" We cannot think our way in. No amount of reading books is going to help. And we cannot force our way in. A heroic effort does not necessarily help us. We feel our way in.

But equally, with the first satipaṭṭhāna, the body—how do we get the awareness right into the body? How do we become fully embodied? We can't think our way in. We can't force our way in. We feel our way in.

So when we look at these three satipaṭṭhānas, first of all they cover the entirety of human experience. And you can see them laid out in terms of gross to subtle. The most obvious one is the body. More subtle than that is this quality of feeling, of affect. And more subtle still are the movements of the citta, the heart-mind. So it's a movement from the gross to the subtle.

Another way of looking at it, a non-linear way of looking at it, is it's like a triangle. The apex is vedanā—feeling. On one side is body and the other side is citta. Because how do I gain access into the body? How do I become intimate with body? Through vedanā. How do I become intimate with citta?

Through vedana. You could say that vedana represents intimacy itself. Because it's so close to contact, the immediacy of experience.

So that's another way of looking at the structure of the three satipaṭṭhānas.

In any event, these three satipaṭṭhānas cover everything, all aspects of human experience, which leads us wondering: why then is there a fourth, since we've already got every base covered? And we'll look at that tomorrow night.

Any questions or comments?

"How is thinking covered by citta?"

That's one of the activities of citta. This is a cognitive activity. So when you look at citta, you can see aspects of it are cognitive, aspects of it are affective. In the standard exercises in the Satipaṭṭhāna Sutta, when talking about citta, it's like "with lust, without lust."

He doesn't specifically mention thinking in the Satipaṭṭhāna Sutta, which shouldn't come as a great surprise because, again, it's a template. I don't think it's meant to be absolutely exhaustive. It's kind of just setting up a basic template and saying, "Okay, have a look around here and have a look around there."

So we talked about emotions, which are certainly covered by citta. But once you look at emotion, you certainly come across thinking—it's part of the baggage. So it's not exhaustive in the sense that he's trying to cover every possible experience.

What I find interesting is that when the Buddha talks about thinking specifically—and in particular, for example, as a distraction—the term that he uses is vitakka vicāra. Now, when he's talking about the development of jhāna, of absorption, the first two jhāna factors are vitakka vicāra. Exactly the same words.

And you can get a sense of where he's coming from, because again, the Buddha is interested in process. He's always interested in the processes of body and mind.

If you think about the meditation process, what do we do with the awareness? We send it to the meditation object. Initial application—vitakka. Boom. Go there. Go there. Go there. Go there. When we get some momentum, we have vicāra, sustained application. We follow it.

If you think about the process of thinking, we've talked about the mind throwing up cognitions, like sparks from a fire. We send the awareness there—bang—vitakka, initial application. We grab one of those and we turn it into a story, a sustained application. It's actually the same process.

I've heard vitakka and vicāra described—Ṛūpī Ketan does this—you pick up some brass pot, vitakka, and then you polish it, you start polishing it. That's one of Buddhaghosa's images. Another one is like a flower that has pollen and the bee is attracted to it. The bee comes to the part of the flower—that's vitakka—and then he's hovering around. That's vicāra.

Another image is like an archer shooting at a target: aim, fire, aim, fire—that's vitakka. And then as he gets more and more skilled, it's just bang, bang, bang, bang, bang, hitting the target every time—that's vicāra.

You could say papañca is another way that people talk about thinking. A particular style of thinking.

"Yeah, like mental fabrication."

Yeah. Which you'll find, if you want to look at citta in vipassana, when you see driven by a desire for, it's covered in the territory even if it's not specifically mentioned. These days I translate papañca as "complication." Don't complicate it. Yeah, it's a great word.

Any other questions or comments?

"I have a question. It's not exactly clear what it is, but at the beginning of the talk you were talking about the different sense modalities and sensitivities, including the sensitivity of touch. And you were talking about the body as the experienced world, in some sense. What I'm wondering is whether, if I talk about a sense modality like seeing or hearing, I kind of think of it as the capacity for those activities, but not what is seen or what is heard. There was just something about the way you said it that made me wonder whether in the idea of—I suppose my experience, my world includes what is sensed, but does the body also sense? Is that also a part of the body? I mean, like the world that I experience?"

The entire experienced physical universe is kaya. This understanding has practical implications for our meditation practice. Rather than shutting off the physical senses when we practice, we can treat them as integral aspects of the practice itself.

You often see people on retreat keeping their eyes down, avoiding any kind of visual contact. This is indeed an excellent strategy if your goal is to maximize concentration, as it reduces sensory stimulus. However, if you're working primarily on developing mindfulness, you can also practice with eyes up and visually engaged. The trade-off is that it becomes more challenging to develop concentration because you're increasing the sensory input.

Yet when mindfulness becomes very strong, this increased stimulus doesn't create agitation or excitement. There's a beautiful balance that emerges.

When I started practicing Zen in the late seventies, we were instructed to sit with eyes open, facing a wall. You would gaze at this neutral surface throughout your meditation. I found this approach incredibly beneficial because I had a strong tendency toward sloth and torpor when meditating. The visual engagement helped maintain alertness and presence.

My favorite meditation spot during that period was in a house in Sydney that housed the first meditation hall of what was then called the Sydney Zen Group, now known as the Sydney Zen Centre.

This approach of including rather than excluding the senses reflects a deeper understanding of what body truly means in the Buddha's teaching—not merely the physical form, but the entire field of embodied, tactile experience that connects us to the world.

And it was the living room, and at the front of the room there was some kind of fireplace arrangement. I used to sit on the right-hand side of that—this was my favorite spot in the corner—because just on the wall there was a light which aimed itself directly at that wall. So I would sit here, eyes open, the wall was painted a light color, and the light would go bang, wham, straight into my eyes. It kept me awake, and I loved it.

I really got into the habit of sitting with the eyes open. When I moved to Theravada, I brought that with me. I can remember doing things like, for example, sitting in the meditation hall at Chithurst Monastery—the men's hall up above. There's this enormous stage, like a theater, with this big image of the Buddha teaching the five ascetics the first discourse. You've got the five ascetics, the sun, the moon, the deer, the forest, and so on. On that top stage were the monks sitting there. The main doorway was over

there, and people were constantly coming and going—going onto the stage, sitting there, arranging themselves, sitting for a while, then getting up and walking out. Laypeople coming in, sitting down, and so on.

I was sitting there with my eyes wide open, and all of this was taking place in my visual consciousness. What I was naming mentally was "seeing." But it suddenly hit me as being kind of meditationally ironic that what I was naming wasn't all this activity which I had no response to at all. It was my thinking. I was having visual thoughts, and I was naming those as "seeing, seeing" because that's where my attention was. I could see every detail in front of me—movement, stuff going on—but there was no response to it, no reaction to it whatsoever. When I was noting "seeing, seeing" for the mind, for the thoughts, the mental images, that really struck me. It's quite powerful.

So is this partly what the Buddha is referring to when he talks about contemplating the body as body internally or externally? I can detect the difference between physical sensations that are internal and external. I get a sense of it, for example, if I'm doing a stretch. When I do my own retreat and do the stretches, I'm in no hurry whatsoever, so I can spend a long time in a single stretch. I keep noting the sensation, and the sense of the posture drops away. The sense that I'm in this particular posture doing the stretch goes, and all there is is sensation. That's all. When that happens, it gives way—it's just air element movement along with the sensation.

People who use hearing as their meditation object often say first they know what they're hearing: "That's the train, that's the bird, that's the highway." Then later on, they don't know what they're hearing. That perception just drops away. It's just sound—not the sound of anything at all, just sound. The perception has gone. It's just sound as sound. Then further on, it just becomes vibration. It's like deconstructing the physical world. The physicality is still happening, but the world that it normally creates is being deconstructed.

You mentioned remembering having that "sound as sound" idea presented to you, and it seemed that that's where you should be aiming, which led to great difficulty. But I'm saying you don't necessarily have to aim for the perception to drop away, although it is a construction. All you've got to do is listen. The perception will drop away—this is always a natural process.

Sometimes you do get mistaken. This mistake can creep in with the way the project is presented to you, where you think, "I've got to get to there." But no, really the project is: this is the direction I'm heading. That's a very different project. You notice that the second project—aim in that direction—is all about process. And again, the Buddha is all about process.

If you take care of the process, the result will take care of itself. If you nurture the plant, you will get the harvest. If you're growing apples, you don't go out there every day and shake the tree, demanding, "When the hell are you going to produce an apple?" You could, but it wouldn't help. You just look after the tree.

And the apple comes. As long as it's an apple tree. And as long as it's growing in an area where apple trees flourish.

So the project is being interested in the process that emerges. What is the process happening here? How does it work? And how does that fit in with this whole new thing that I'm trying not to do of open awareness? How do you be interested in the process of open awareness without doing interested in the process?

Probably you just don't worry about that as being altogether too complicated. And just be interested in whenever you find yourself doing something with the process. So there I go interfering with it again. Just relax. Or there I go doing something. Just relax. Or there I go trying not to do something. Just relax.

The process is very fascinating. It's driven my whole practice for years—the actual interest in the process, whatever process I might be looking at. So yeah, I'm back to planting, I guess. Just being attuned to the quality of effort. Trying, trying. Don't try, just let it happen.

It's the world—the arising of the world, the cessation of the world, and the path leading to the cessation of the world. Doesn't the whole world change with the citta? When the citta changes, my world changes. It's a completely different world. The trees are different, the sky is different.

So the world is a lot more malleable than we take it to be. It's one thing we discover.

Thank you very much.

CHAPTER 18

The Fourth Satipaṭṭhāna

Patrick Kearney · 1h09

In this comprehensive exploration of the fourth foundation of mindfulness, Patrick Kearney examines dhammānupassanā - the tracking of dhamma/dhammas. He clarifies the deliberate grammatical ambiguity in Pali between dhamma (singular - the teaching, reality, framework) and dhammā (plural - experienced phenomena). The talk covers key doctrinal lists from the Satipaṭṭhāna Sutta (MN 10), including the five hindrances and seven factors of awakening, explaining the practical instructions for recognizing their presence/absence, understanding their arising conditions, learning to abandon the unwholesome and cultivate the wholesome.

Kearney emphasizes that meditation practice requires a conceptual framework - there is no practice without theory. He illustrates how the fourth satipaṭṭhāna provides the Buddha's framework for creating meaning from meditative experiences, transforming particular insights into universal understanding. The talk explores how practitioners train themselves to perceive reality as dharmas - experienced events rather than independent things - leading toward the emptiness and not-self insights that characterize awakening. This represents the maturation of satipaṭṭhāna practice, where one abandons the world of self and things to inhabit a world of interdependent phenomena arising and passing according to conditions.

Last night we looked at the first three satipaṭṭhānas, and tonight we're going to examine the fourth. As we explored them, we pointed out that the first three—which cover body, citta (heart/mind), and in the middle, vedanā—encompass the entirety of human experience. This naturally raises the question: what is the fourth one doing?

If you look at translations, the first three typically receive consistent translations with little controversy over their meaning. The fourth one, however, appears with different renderings. For example, while the third one, citta, is sometimes translated as mind, you'll sometimes see the fourth one translated as "mind objects"—though I always wondered what a mind object actually is. Sometimes it's translated simply as "the dharma," and Bhikkhu Bodhi renders it as "phenomena." These different possibilities point to something significant about this fourth foundation.

Essentially, the fourth one is called dhamma-nupasanā in Pali. According to Pali grammar rules, this can be divided as either *dhamma* anupasanā or *dhammā* anupasanā. The second word is definitely anupasanā, which means tracking. The first word can be either dhamma or dhammā—the difference being whether it's singular or plural, dharma or dharmas.

I use the term "dharma" because it has entered the English dictionary as a borrowed word. This difference between singular and plural is crucial because it gives quite different spins on the meaning. I believe this ambiguity is deliberate, which is why it's impossible to translate adequately—it encompasses both the tracking of the Dharma (singular) and tracking the dharmas (plural). But you can't capture that in English, so translators usually choose one or the other. As I mentioned, Bhikkhu Bodhi chooses the second interpretation, dharmas, which he translates as phenomena. I usually follow him in that regard.

So there are two aspects here: dharma and dharmas. Let's examine the first one—dharma.

Dharma is a key technical term; the Pali word is dhamma. If you look up dhamma in the old Pali Text Society's Pali-English Dictionary—a rather large volume with very small print—the entry for dhamma takes several pages. It's extensive, complicated, with multiple meanings.

Dharma can mean the way things are—reality itself. Dharma can also mean the teaching that points to the way things are, hence the Buddha Dharma—the Buddha's version of dharma as opposed to other dharmas. You might speak of the Christ dharma or the Krishna dharma. Dharma also encompasses, given that this is what's happening, what should I do about it? Here you encounter dharma as duty, as what one should do. "What is my dharma in this regard? What should I do about this?"

In the context of the fourth satipaṭṭhāna, dharma refers more to the second meaning—the teaching or the meaning one puts upon experience within the framework of the Buddha's teaching.

When we engage in these practices, we're cultivating intimacy with present experience. We do this consistently, but we do it for a reason. One of those reasons is so that some kind of meaning emerges from it—some kind of understanding arises from all this attention.

I'd like to compare this practice to having a big sheet of white paper and a pen or brush with black ink. Each time we note an object, each time we're deliberately aware of something, it's like taking that brush and making a dot on the big sheet of paper.

Then we note something else—another dot. Then something else—another dot. We keep doing this, and at some point, if we step back, we can see that some kind of pattern is emerging from all these dots.

In English we have the expression "to join the dots." This happens, then this, then this, then this, then this. At some point it means something. Some kind of meaning can be extracted from the experience. This is dharma in the first sense.

We've been discussing mindfulness and clear understanding—sati sampajañña. Mindfulness is remembering the experience, remembering the present. Sampajañña is clear understanding.

As we track experience over time, we start to understand what it is, how it works, what it flows into. Sometimes we speak of this in terms of what feeds this, what does this feed. We are cultivating an understanding. This is why mindfulness is associated with wisdom, as we've been discussing.

This understanding involves a movement in the practice from the particular to the universal. We begin with the particular—just this, just this. From there we arrive at the universal: the whole universe is this. We explored this yesterday through the perception of impermanence. This is changing. At some point we realize everything changes, including the person who's looking at change. This is a movement from the particular to the universal, and insight belongs to this realm of the universal.

We spoke yesterday of the growing ethical sensitivity that develops in the course of this practice. This ethical sensitivity can also be seen as a development of understanding. We start to understand the Dharma—the way things are, the way life moves. We begin to understand the Buddha's Dharma, his teaching about this and how it applies.

In the Fourth Satipaṭṭhāna, you encounter a number of doctrinal lists. In this discourse, in this section, doctrines are what get spoken about. In previous sections it was simply mind-body process, but suddenly in the Fourth Satipaṭṭhāna, doctrinal lists begin to appear. Two of them are the five hindrances and the seven factors of awakening. Some scholars think that in the earliest version of this sutta there were probably only those two, and that other lists were added over time. Of course we don't know this—it's pure speculation. But it's interesting speculation, and it certainly points to the importance of these two lists.

What these lists address is the sutta's expansion on this whole notion of ethical sensitivity. It's saying: not just be sensitive to what's happening in the citta, but look for these events in particular. Check these out. These are important.

The first list is the five hindrances, drawing attention to our obstacles. What gets in the way of this practice? This is what we need to study, and we've been talking about this throughout the retreat in terms of working with distraction. Here that general principle is being formalized with this official list of the hindrances.

The flip side is: what are we cultivating? The hindrances represent what we should be sensitive to and able to understand so that we can drop them. The counterpart is what we need to be sensitive to in order to cultivate skillful qualities. What helps us along the path? This is the classical list of the factors of awakening—five hindrances, seven factors of awakening.

Let's quickly go through these two lists. Each one could merit at least one dharma talk, so tonight we're simply going to survey them for an overview.

The five hindrances, which you probably all know: sense desire; malice or hatred or ill will; stiffness and dullness, or classically translated as sloth and torpor—which you must admit has a certain ring to it; restlessness and worry; and finally, paralytic doubt.

Regarding these, the Buddha says: "How does a practitioner live tracking Dharma as Dharma? Here a practitioner lives tracking Dharma as Dharma in terms of the five hindrances." How? Here he gives instructions—practical instructions in how to work with obstacles.

There are five things he says you should look for. We'll go through the first one, which is sense desire. The five aspects are: First, the practitioner understands that there is sense desire in her. When it's present, you understand it.

When there is no sense desire in her, she understands there is no sense desire in her. She understands the arising of unarisen sense desire. She understands the abandoning of arisen sense desire. And she understands the non-arising in the future of abandoned sense desire. He goes through the same pattern for the other hindrances.

You notice, first of all, that the job is to understand. This is a wisdom aspect, showing that the practice is maturing. The first thing we have to understand is the presence or absence of the hindrance. When there's an obstacle, we have to understand that it's present—that this is what's happening.

This is sometimes obvious when I'm completely overwhelmed by something. But it can be quite subtle, particularly in the realm of vedanā. If there's some kind of unidentified feeling deep in the citta that's just coloring everything, I don't really notice it because the mind is going out to the sense object. I notice that today is particularly dif-

ficult—the sense objects are really painful, quite messy, and I don't like it. What to do? I've got to slog away. Then I decide, no I won't. I think I'll take a break. I'll go for a walk. That sounds much more sensible.

So we're preoccupied with what it is that we are noting, and we tend not to notice what's underneath that—what's in the citta of the practitioner who's doing the noting. It might be, in this case, aversion or ill will, or it might be desire for something else to be happening. But because it's just underneath the surface, I might not necessarily even notice that it's there. Then as soon as I notice it and deliberately send the awareness into the citta—ah, that's what's going on—everything can then settle.

With these five hindrances, you've got the first two: desire and aversion or ill will, hatred, malice. These are disorders in affect—they're both about vedanā. Then you get stiffness and dullness versus restlessness and worry—these are disturbances in energy. Then you get paralytic doubt, which is a disturbance of the will. The hindrances cover a range of types of experience. They can be obvious, they can be quite subtle. Sometimes it's what's coloring the whole thing further up, but we just don't notice it.

So the first thing to do is to notice when it's present—what is present, what obstacle is present, what's getting in the way. What exactly is getting in the way here? To be able to identify that.

The Buddha also says to notice the absence of the hindrance. This is even more subtle. It's relatively straightforward to notice when something is present; it's harder to notice when something is absent. If I go to a social gathering, for example, it doesn't take me long to notice who's here, who's present. But it can take a while before I twig who didn't come. That's harder to recognize.

So noticing absence is harder to recognize than presence. I think this is particularly useful if you have a habitual obstacle. When that happens we tend to get upset about it: "Oh God, it's back again. Will this never leave me?" Then when it's not there we tend to take it for granted and just forget about it, instead of actually noting the absence of this obstacle and what it's like to be without it.

It's rather like in body work—there's tension in the body. You put the awareness there, breathe, relax, and release the tension. What is it like to release tension? What is it like to be without the tension? It's just as important to notice that as it is to notice the tension. They're two sides of the coin.

So we've got presence and absence of the obstacle. Then the third one is how the obstacle arises—in other words, what feeds this? Here we enter into an aspect of dependent arising. Presence and absence is dependent arising—things come and go. But things come and go because of something else. So this is broadening the investigation. Something happened and this hindrance arose. What is that? What feeds that?

Then you get the flip side: how the hindrance can be abandoned. This happens and the hindrance arises. Something else happens, and it drops away. So what's that one? How do I abandon it?

What conditions do I cultivate so that it goes away? When we look at how the hindrance can be abandoned, it's easy to take this as "how will I abandon the hindrance?" But sometimes it's not that at all. Sometimes it's just that I change the conditions and the hindrance falls away. It's not me—it's more like what I did was try something out and change the circumstances, and then oh, okay, it fades now. So I've discovered something.

And the last one: she understands the non-arising in the future of the abandoned hindrance. I think this means how this particular aspect of the hindrance can be outgrown so that we mature beyond it. So we feel confident that this isn't going to come back again. I've outgrown this. I can feel free from this now. Something will come up, some difficulty will come up, but not this. This is something that I've managed to outgrow.

Notice that all of this is more than simply being aware of it. Remember we talked about mindfulness of breathing and how the Buddha uses the verb *sikkhati*—training the mind to achieve something. Training the mind to become sensitive to the whole body, training the mind to calm the bodily formations. Here, the use of this verb *sikkhati*—to train—implies not simply witnessing, not simply being present to something, but actually taking the experience and steering it in a certain direction. I need to go here with this.

So with the hindrance, I recognize the hindrance, I need to abandon this. It's not just "I need to be mindful of it"—that helps to abandon it—but the project is to let it go, to drop this. So I set a direction in which there are certain things I'm deliberately trying to let go of, because they are *akusala* and they lead to harm and suffering.

Does that make sense? So this is all about abandoning the unwholesome, which summarizes a great deal of the path. Much of the rest of the path can be summarized as cultivating the wholesome, the *kusala*. And this is represented by the seven factors of awakening.

A practitioner lives tracking dhamma as dhamma in terms of the seven factors of awakening. How? And then he goes through all seven of them, and these are mindfulness, investigation of phenomena, energy, rapture, tranquility, equanimity, and concentration. Again, we could spend all night on these, but we're not going to. We're going to skip over them and just look at the structure, how the Buddha talks about them.

So the first one is mindfulness. The Buddha says: When the mindfulness factor of awakening is present in her, a practitioner understands the mindfulness factor of awakening is present in her. When the mindfulness factor of awakening is not present in her, she understands the mindfulness factor of awakening is not present in her. She understands the arising of the unarisen mindfulness factor of awakening. She understands how the arisen mindfulness factor of awakening matures by development.

So again, it's all about understanding. And the Buddha again begins with presence and absence. Is it here? Is it not here? Can I learn to recognize it? Can I recognize when I'm being mindful? Can I recognize when I'm not being mindful? So this is one of the reasons why getting clear on the basic concepts is important, because then I can actually start to tell what's going on. We spoke about the presence of mindfulness as being revealed by the felt continuity of awareness as being a key indicator. But if I'm working with presence and absence, it's like, well, I have to get to know it. How do I recognize it, whatever its characteristics?

And again, as with the hindrances, noticing its absence is harder than noticing its presence. But that too is part of the training. So, presence and absence.

And then, the arising of the unarisen mindfulness factor of awakening. This is "how can I encourage this?" So again, what feeds this? What can I do to encourage mindfulness? The two obvious ways that the tradition talks about, which we've mentioned, are first of all continuity. If I have a continuity of mindfulness, the mindfulness will tend to become stronger. And secondly, a clear perception. I look for something obvious and clear.

And then understanding how the arisen mindfulness factor of awakening matures by development. In other words, having found it, how do I cultivate it? How do I make it stronger? How can I learn to live in it and make it habitual? And this is cultivating the wholesome.

So these are two of the fundamental aspects or categories in this Satipatthana. You can sum them up by saying: learning how to abandon the unwholesome, learning how to cultivate the wholesome. First of all by recognizing them—when they're there, when they're not there. And then in the case of the unwholesome, learning how to let it go. In the case of the wholesome, learning how to cultivate it.

This perfectly aligns with the ethical sensitivity we explored yesterday evening. What this entire endeavor highlights is our fundamental need for a conceptual framework through which we can understand what's unfolding in our experience.

This is crucial. While I haven't heard it as much in recent years, I vividly remember in my early meditation days a common refrain from practitioners: "I'm just interested in the meditation, I'm not interested in the theory. Don't burden me with all this theoretical stuff—I just want to practice."

Of course, this attitude is complete nonsense, because there is no practice without theory.

"I just want to practice." Fine. Practice what, exactly? "Well, I want to sit down and follow my breathing." Why? Why not sit down at a sports ground and follow a game of football? You're sitting down. You're following something. So why follow this one and not that one? Because there's a theory that says this is beneficial and explains why it's beneficial.

There is no such thing as meditation practice without theory. There are meditators who are deeply confused about their theory. There are meditators who remain only dimly aware of what it is. There are meditators who grasp after any floating, fashionable notion and stick it onto their practice to frame it. But there is no such thing as a meditator who has a practice and does not have a theory. Such a person simply does not exist.

So if we're going to have a theory, let's have a good one—one that actually works.

I'll be controversial and say something that will please Mal. One of the most successful meditation and mindfulness interventions in the contemporary secular world is, of course, MBSR—Mindfulness-Based Stress Reduction. There, if you read Jon Kabat-Zinn, you encounter the practice package, the course structure they follow, and what he calls in his earlier writings "the paradigm"—the theoretical framework surrounding it.

The practice package is genuinely excellent, but the paradigm is rubbish. I shouldn't say this while being recorded, but frankly, it's completely confused and is causing all sorts of difficulties throughout the research world studying mindfulness. When con-

ducting scientific research, you need a crystal-clear conceptual framework. Yet there are endless fascinating debates and controversies precisely because his framework simply doesn't match up. Trying to found any kind of scientific endeavor on his theoretical framework is like marching into mud, marsh, and quicksand.

What's interesting is that it works—the practice package works remarkably well despite the inadequacies of the framework. But he does have a framework. You must have a framework.

The Dharma is the framework the Buddha provides. It's about how we can create meaning in our lives.

I might have a strange experience during a meditation retreat, but it doesn't necessarily mean anything at all. There was a time when I was teaching here—this must have been fashionable then—when every retreat included at least one person who had come explicitly to have a good catharsis. People would express disappointment at retreat's end that they hadn't had a proper weeping session, because they were there to undergo some kind of emotional catharsis. A friend of theirs had done a retreat here, experienced this incredible emotional catharsis, so naturally they wanted one too. Strangely, every retreat would include at least one person quite explicit about this motivation. For years I haven't encountered a single one, so it must have been a passing fashion. Perhaps they felt my disapproval radiating.

But one of the peculiar aspects of this practice is that sometimes people have spectacular experiences. That's lovely. Yet later they have very subtle experiences, and it turns out the subtle ones are far more important. It's not the power of the experience that matters—it's the meaning of the experience that matters. That's what transforms a life.

The purpose of practice is to change how we live. An experience accomplishes this through the meaning we assign to it.

Someone could have an intense experience of pain, distress, fear, panic—whatever—during meditation practice, decide they've uncovered some mental disorder, take themselves to the appropriate clinician, receive the appropriate medications, and stay away from meditation for the rest of their lives because it's obviously not beneficial for them. Given the meaning they've placed on that experience, life heads off in a particular direction.

Or they could have exactly the same experience, be told that what they're encountering is a particular glimpse into the emptiness of phenomena, the groundlessness of experience, and that yes, all this fear and horror they're experiencing is a completely appropriate response to the situation. However, it's only half the view. What they must do is continue forward to reach the other half.

But you've got to go through this one. Then you'll more fully understand what the Buddha is talking about. You're getting a very clear sense of dukkha. Congratulations, that's great progress. Now you need to move on to the next bit.

Is it the teacher's duty to translate that? Yes, that's part of the job of the teacher. And then, if the person takes that on board, life goes off in another direction. And I'm biased, but I would suggest that direction is a lot healthier than the first one.

It's all about the meaning of the experience—how it's read, how it's interpreted. And yes, it's the job of the teacher to do that interpretation for the student. You notice that in the interviews, that's a lot of what we're discussing. We're actually reading the experience. What does it mean? Where does it fit within the system? And of course these dharma talks, step by step, outline a conceptual framework within which we can place experiences. This is what it means.

One example that always occurs to me when I'm giving this talk involves a friend of mine when I was at Mahasi Center—a monk from the US, still quite a young man at the time. He had started meditation perhaps ten years or more earlier, quite young. He was attending a retreat in the US and threw himself into his first retreat with great intensity.

Somewhere during this retreat he had a quite profound experience in which basically everything crumbled. His whole sense of who he was just dissolved. Naturally, he was somewhat alarmed. So he went to the teacher and explained the experience. This is what I remember of what he was telling me, if my memory serves correctly.

He said it was like the teacher just did this quick double take and muttered something like, "No, it couldn't be." And then reassured him: "There, there, it's okay. Don't worry about it. It'll be all right." And sent him off.

It was fine as long as he was in that retreat. But when he left, he completely fell apart. Fortunately, he had the determination to keep going. Ten, twelve years later, he's telling me this story.

So I asked him, "Venerable Sir, why are you telling me this story now?"

And he said, "Because in the last sitting, it happened again. Only this time, my response was, 'Ah, that's where it fits. Tick that box. Time to move on.'"

The same experience, but different meanings. The first time, he had no framework to put it into. The second time—ah, of course, tick. He had the framework set up, he'd been doing the practice. It was less than a problem. It was another piece of the jigsaw puzzle, everything falling into place. This is what's going on.

So the framework is really important, and this fourth satipatthana is all about the dharma—the framework. This is what it means. This is how you read the experience.

And then we come to dharmas. Here I'm using these to illustrate this point. Actually, all of these lists can be read either as the dharma or the dharmas, but rather than go through all of them twice, I'm just picking the first two as illustrative of the dharma—the wholesome, the unwholesome, the kusala, the akusala—and I'm picking the next two as illustrative of the dharmas, plural.

Does this make it plural in Pali as well? It's long *a* in Pali. So if you have two words and you join them in a compound, let's say your first word ends in *a*, short *a*, and the second word ends in *a*, short *a*, then they join together and it becomes long *a*.

So Dhamma Anupasana becomes Dhamma Anupasana. If you have the first word ending in long A, and the second word beginning with short A, then long A plus short A equals long A: Dhamma Anupasana.

That's why it's ambiguous. The plural is the long A—Dhamma. In English it would be "dhammas." So it's plural.

Here the Buddha talks about the five aggregates and the six sense fields, which we'll be exploring more later. When the Buddha analyzes the nature of the human being, his two favorite frameworks are the five aggregates and the six sense fields.

The five aggregates, or five bundles, are body, feeling, perception, constructions, and awareness. You'll notice the first two of them are also the first two satipatthanas. The Buddha's instruction for practicing with these is beautifully simple: Such is body, such is arising, such is disappearance. Such is feeling, such is arising, such is disappearance, and so on.

It's this coming and going—the impermanence of the aggregates that he emphasizes. The job here is to directly experience the arising and disappearance of each aggregate, and therefore to perceive their emptiness, that there's no one there in the midst of them. We'll explore this more deeply in another dharma talk.

Then you have the six sense fields—the six sense sensitivities of seeing, hearing, smelling, tasting, touching, and minding, along with their corresponding sense objects, which we've already discussed.

A practitioner lives tracking dharmas as dharmas in terms of the six subjective and objective sense fields. How? The Buddha goes through each one in the same way. We'll start with seeing.

A practitioner understands eye sensitivity, or seeing sensitivity. She understands forms. She understands the fetter that arises dependent on both. She understands the arising of the unarisen fetter. She understands the abandoning of the arisen fetter. And she understands the non-arising in the future of the abandoned fetter. And so on with the rest of them.

Here you have the sensitivity, the sense object, and the meeting of both, which is contact. This whole process must be understood. Then you have the fetter that arises dependent on both. "Fetter" here is samyojana—as in yoga, it's the same word. Yoga comes from the root yuj, meaning to yoke or bind. The English word "yoke" comes from the same root.

Yoga is a joining or binding. In the yoga traditions, yoga is seen as joining or binding with the divine, the unconstructed, or whatever. Sam indicates "with," so samyojana means to join with or be bound with—and here it's in a negative sense, something that ties us up to something. We're bound, we're fettered.

When the Buddha discusses sense perception, remember we talked about vedana. When he talks about contact—you have the sensitivity, the sense object, the corresponding awareness—the meeting of the three is contact. Contact conditions feeling, an affective response. Feeling conditions craving. Craving conditions clinging. That teaching is all about how we get entangled with sense objects.

The vedana gets out of whack and we find ourselves completely lost, being blown about by our relationship to sense objects. Here he's talking about the same process, but in terms of the samyojana, the fetters, the bonds. It's like we're bound to these sense objects—completely entangled with them. They're sticky and we can't get away from them. They dominate us.

Understanding this process—and the samyojanas, the binds and fetters—these are of course akusala. You get the same relationship as with the hindrances: She understands the arising of the unarisen, the abandoning of the arisen, and the non-arising in the future of the abandoned. It's the same process: What feeds it? How can I let it go? And how can I outgrow it, so this particular instance won't happen in the future?

But it's all about our relationship to sense objects—how the senses cling to their corresponding objects and how we get emotionally entangled with them in a very negative way.

Negative in the sense that it leads to pain for ourselves and for others.

Finally, at the end, you encounter the four truths. There are two versions of the Satipaṭṭhāna Sutta—one in the Majjhima Nikāya and the other in the Dīgha Nikāya. The Dīgha Nikāya version is slightly longer and includes the four truths, which indicates the culmination of the practice. Understanding the four truths is code for awakening itself.

A practitioner lives tracking dhammas as dhammas in terms of the four truths of the Noble Ones. How? A practitioner understands realistically: this is dukkha. She understands realistically: this is the arising of dukkha. She understands realistically: this is the cessation of dukkha. She understands realistically: this is the way leading to the cessation of dukkha.

Seeing the four truths represents awakening. We'll probably talk about the four truths again in a separate talk later in the retreat.

Throughout this section, we're speaking of experience in terms of dhammas—learning to experience things in terms of dhammas and the interrelationships between dhammas. This takes us to emptiness and to not-self.

Our normal relationship to what we take to be real involves looking out at the world and seeing beings and things, then noticing what relationship we find ourselves in to these beings and things. I'm sitting here and I see beings and I see this room, and from that I work out my relationship to these beings and this place. These beings are meditators who have come to Blue Mountains Insight Meditation Center to do a meditation retreat, and I'm the teacher. So first I have things and people, beings, and from that I work out the relationships.

The awakened one has the complete reverse relationship. An awakened one looks out at the world and sees a network of relationships, and from that infers beings and things. What's real for the noble ones are the relationships, not the beings and not the things. What's happening here is a network of relationships expressed as this particular group of beings and this particular series of things.

We have two different ways of relating to the world: one is what Buddha would call the world of self, and the other is the world of emptiness, of not-self, of dhammas.

The example I like to give, because I'm usually in this particular circumstance when talking about this: as the teacher, I not only get my own throne where I sit above you so you can look up at me—except those of you sitting on chairs, especially tall people on chairs—but I have my special equipment here, all of which indicates my status. One of them is this glass of water.

What is this glass of water? From the world of self, which we talked about before as the third-person world, this is a glass partially filled with water. What is water? H2O. Glass is a certain kind of substance. This glass of water can be studied; the physics of it can be studied and appreciated. But the thing about it that's most obvious to me is that it exists completely independently of me.

When I came in earlier, that glass of water was here. It was the same glass. I'm pretty sure it was the same glass that was here yesterday and the day before. I'm pretty sure nobody went out and washed it and got me a new one. When I leave at the end of the talk, it will remain here because it's a glass of water just sitting here. All of this is blindingly obvious, isn't it? Does it need to be explained to you? You already know this. This is the way we relate to the world in terms of self, not emptiness, not dhammas.

Or I could view this glass of water as dhammas. If it's dhammas—notice again, plural—then what is it? It's this. That's what it is. That's its nature. That's its very existence.

Wanting is a dharma. Turning is a dharma. Seeing is a dharma. Reaching is a dharma. Touching is a dharma. Lifting is a dharma. Tilting is a dharma. Tasting is a dharma. Wet is a dharma. Swallowing is a dharma. Satisfaction is a dharma. Placing is a dharma. Hearing is a dharma. All these are dharmas.

Does that sound familiar to you? Have you been doing something like this?

In this practice, what we're doing is training ourselves to live in this world of dharmas—to actually start to perceive the world as a whole series of dharmas. A dharma is an experienced event. It's the experience of something. It's not the something. It's the experience of something. It's first-person experience.

For example, some people have commented, "Yes, I've been doing this practice and now I step outside and it's like a whole different world." Has anybody had any experience like that? Do you seriously believe it's a different world? Should I call the mental health team? They're probably useless.

Objectively, it's the same world. But from the perspective of the dharmas, you're absolutely right—it's completely new. It's never been here before, and it never will be here again. This is the world of the dharmas, and this is the world that we're training ourselves to inhabit.

You notice that in this world, there's no room for me. There's no room for you. There's not even any room for the Blue Mountains Insight Meditation Centre. There's just the dharmas coming and going according to conditions. Does that make sense?

This tracking of the dharmas indicates the maturity of satipaṭṭhāna—when we actually live in this world. When we abandon the world of self and what belongs to self, the world of beings and things, and we live in a world made up entirely of dharmas. This represents the maturity of the practice.

But you can see from the moment you begin the practice and learn to note rising, falling, in, out, lifting, pushing, placing, seeing, hearing, touching—from the moment we begin to do that, we are training ourselves to perceive ourselves and our world in terms of dharmas. This is the boot camp training that we're putting ourselves through.

Notice that what we're doing is deliberately changing our perceptions based on a theoretical framework—the Buddha-dharma, singular—which gives rise to a particular way of structuring attention, the meditation method, which is designed to lead perception in a certain direction, which is considered kusala, wholesome, in which we train ourselves to perceive the world as dharmas.

So you have the tracking of the dharma, and you have the tracking of the dharmas, and they intersect. They come together. This is the fourth satipaṭṭhāna.

If you think about a pie chart—draw a circle, and you've got four satipaṭṭhānas, and you wanted to illustrate this—you'd be tempted to draw a vertical line and a horizontal line, and you've got four slices. But that is not the way it's structured. Actually, it's three slices, which are the first three satipaṭṭhānas. The fourth satipaṭṭhāna is the whole cake experienced from a certain angle. This is why it doesn't quite fit neatly and tightly. It's just taking the whole thing from a completely different angle.

Any questions or comments?

"I'm not sure if it's confusion, but the suggested activities of the fourth section of the time—like the deliberate cultivating and abandoning—seems slightly different from and more than just noticing arising and ceasing in the first thing."

The first three? The first three satipaṭṭhānas you mean?

So far we've just been observing and letting things be, which is very pleasant and actually quite helpful. But what attracted me to Buddhism was reading about the Five Hindrances as a list, and that suggests action—abandonment and cultivation—which doesn't seem the same as simply noting.

Actually, it is the noting and noticing. The noting and noticing gets you into the game. Part of the game is indeed just noting and noticing, but there's more to it than that. You have to get into the game first. What you discover is that you're already playing the game before you even notice it.

For example, you might say, "I'm just going to note and notice for the next thirty minutes." But how do you actually do that? You find yourself massaging your experience in order to be able to do that. You're already working with the hindrances and cultivating the factors of awakening. So this takes the game to a different level, and it's kind of assumed.

Why do people take up meditation practice in the first place? Because they think their lives will become better. They might not follow that thought through to its logical conclusion—yes, that means abandoning the akusala and cultivating the kusala—but in fact, that's how it's done.

This is something we learn over time. It takes time because it takes time just to learn to recognize what is kusala and what is akusala. We're deluded, so we don't know. We're confused about it. So it's not contradictory so much as it's just another part of the complex. It's not as simple as simply being aware—there's more to it than that.

That aspect of practice is also present in sīla, isn't it? In the tradition, sīla is taken as a pre-given foundation. It's assumed you might not even start without it, but certainly you wouldn't get very far without cultivating sīla. If that doesn't develop, then the practice gets bogged down.

This is why doing nothing is so hard—because you start with a purpose. Doing nothing opens up different aspects of doing. For example, doing nothing is often abandoning because I'm not doing the akusala. But also, in order to do nothing, I have to really develop and cultivate mindfulness, concentration, and so forth, which means I'm cultivating the wholesome.

But you chose the example of the unwholesome...

Actually, doing nothing is wholesome. Then I suppose you'd have to make sure you didn't start cleaning something. The wholesome thing allows for that.

So it's a moving feast. If I cling to the wholesome, that's unwholesome. It can get very complicated. Let's just go to bed!

I think sometimes there's the marketing of it. Somewhere—I don't know why—in our culture, the marketing somehow got reduced to "all it is is just be aware." It must have been watered down to that point. I remember seeing a book by Sayadaw Tejaniya: "Mindfulness Is Not Enough." Because if you look at the Dharma, it was never just about bare attention. The fourth satipaṭṭhāna has been there the whole time, and yet somehow we think it doesn't count or something.

It seems to me a multi-layered and almost spiral practice. You go around and around and over and over again. But each time you go over the same ground, it's different.

And you've got another layer and another layer and another layer, and it opens up and opens up like an inverse onion or something—like you're in the middle of the onion and you get through another layer and it's bigger, and then you get through another layer and it's bigger and even more and more. It just opens up.

I think culturally what's happened is that what our culture has lacked for a long time—and some people say it used to exist long ago—is any practical understanding of how to pay attention to one's inner world in a systematic way. In other words, what in the Indian tradition is called meditation. It's just absent from our culture.

Partly, I think, this is because it was driven underground by various churches over the centuries, as they saw it as a threat. I can remember—I was raised Catholic—being very interested in contemplative prayer at a young age. I used to read these books about it, but I never found any book that actually said how to do it. It was all mystical theology, incredibly abstract, and I never found any clergy person who had anything useful to say about how to actually do it. No one knew.

And then along comes Buddhism, and suddenly these people know how to do it. What you find, for example, is a lot of Christians going to Buddhists to learn how to meditate. Then they bring it back to their own tradition, where it's immensely valuable.

In the secular world of psychology, you can look at the different psychological interventions that have taken up mindfulness. What each of them has is some kind of understanding of how the mind works and, using Buddha's language, what's kusala and what's akusala. But they have no way of getting people to actually look inside their own minds and figure this out. Then here comes Buddha's meditation. Bingo.

So it's all about the attention, the quality of attention, because that's the key—that's the missing link. That's what people have seized upon, including this term "bare attention." Now gradually there's a dawning understanding that actually more is required, that there actually is more to it than this.

And then you get the debate: should we figure it all out for ourselves because we're scientific and psychological, or should we go and maybe ask the Buddha? Oh no, we're being religious there. We don't want to do that.

There's also this need for technology in our society—to look at technique and technology, apply the technology to the problem, and solve the problem with the scientific method. Science questions religion. So all of this stuff has to be sifted through the scientific sieve to be measurable and objective. We can get an app, a meditation app.

I wish I could write one. It would make a fortune. Mine would have an angry voice saying to you, "Just sit down and don't move. And don't bother me again."

I notice, in terms of my own experience, what I feel very strongly when I have these experiences is a desire to understand the experience, rather than to simply think, "Why is this happening? Where does it come from? Why am I doing this?" I do think, in terms of my practice, if I can hold whatever arises in a sufficiently strong attention, then it will transform into something else.

That's the first two aspects—the presence and the absence. These are not static. For the Buddha, they're always dynamic. So there's the arising and the disappearance. Arising and disappearance always presuppose dependent arising, which means if an understanding opens up—I'm seeing, "Ah, this arises because of this, and this arises because of this, and this arises because of this"—so it is understanding. We study it.

The Buddha, in the Four Truths, says that with the first truth, dukkha—which is what we're talking about—the job is to understand it, to fully understand it. So it's not suppression. And understanding sometimes leads to a spontaneous abandonment—"I just don't want this anymore." But sometimes perhaps something stronger is required. It depends on circumstances.

The desire to understand can indeed be a skillful approach. There's wisdom in recognizing that sometimes understanding naturally leads to the abandonment of what causes suffering, while other circumstances may call for a more direct letting go.

Your inclination toward understanding reminds me of something from my time at a study monastery in northern Thailand. This particular monastery taught the traditional medieval Burmese curriculum, which included extensive study of the Vinaya—the

monastic rules. The abbot there had a fascinating perspective. He would say that it was absolutely crucial to understand the Vinaya thoroughly, but not necessarily so important to follow every detail precisely. His emphasis was always on understanding: What is this? What does it mean? Why does it exist?

As he would joke, "You've got to be a good lawyer if you're going to survive with all these rules!" But beneath his humor was a profound teaching principle—that genuine understanding often creates its own natural boundaries and appropriate responses.

This approach can be quite liberating when working with difficult mind states or patterns. Sometimes the very act of truly seeing and understanding what's happening is enough. The light of awareness itself becomes the agent of transformation, without the need for force or struggle.

Of course, we must be honest with ourselves about whether our interest in understanding is genuinely leading toward freedom, or whether we're sometimes using investigation as a subtle form of avoidance. Both the analytical mind and the surrendering heart have their place in practice, and wisdom lies in knowing when each is most skillful.

CHAPTER 19

Mindfulness Immersed in Body - Kāyagatā Sati

Patrick Kearney · 1h27

> *In this profound talk, Patrick Kearney addresses the foundational practice of kāyagatā sati —mindfulness immersed in body—drawing from the first satipaṭṭhāna of kāyānupassanā (tracking of body). He shares personal experiences from retreats in Sri Lanka and Burma to illustrate how meditators often struggle against their bodies rather than inhabiting them with awareness. A pivotal insight came from Venerable Vivekānanda, who pointed out that Patrick's meditation challenge wasn't samādhi (concentration) but passaddhi (tranquility) —the physical calm that supports mental stillness.*
>
> *Kearney examines how our minds habitually separate us from bodily experience, creating conceptual worlds where we locate ourselves in past, future, or elsewhere rather than here and now. The body, he explains, speaks only in sensation—a language we've become deaf to, receiving messages only when they're loud and crude. He discusses how chronic tension arises as a defense mechanism to perceived threats, becoming habitual patterns that define our sense of physical limitation.*
>
> *The talk features a beautiful teaching from the Cīvara Sutta about the Buddha's instruction to Mahākassapa: "I will not abandon mindfulness immersed in body, associated with joy." This instruction emphasizes not just body awareness, but cultivating a pleasurable relationship with embodied experience. Kearney stresses that bodywork is meditation itself—not preparation for it—and that establishing posture must happen from the inside out through feeling and relaxation, rather than forcing the body to conform to external images. The discussion includes practical guidance on distinguishing between productive discomfort and harmful pain, particularly regarding vulnerable areas like the knees.*

Tonight I want to speak about kāyagatā sati, mindfulness immersed in body. This obviously refers back to the first satipaṭṭhāna, the kāyānupassanā, the tracking of body. This is basically about the relationship with the body that we have as meditators, which I've come to realize is extremely important.

Actually, I realized it was important from the beginning. The first meditation retreat I went to was in Sri Lanka in 1977, sometime around then. It was at a place outside Colombo—I forget the name. We had these tiny little concrete cells to live in and a little bit of veranda. The bed was a cane mat on the concrete floor. Part of the concrete floor was raised up a bit, and they had a cane mat on it. That was pretty much it.

We were supposed to sit there for hours every day. I noticed a lot of people cheated and leaned against a wall. In fact, the wall was concrete and there was this black stain along it at about head height, if you leaned against it. So I did, of course. I had a little cushion, and I survived two weeks, and my knees hurt for two weeks thereafter. I spent most of the time wrestling and struggling with the body, and realized I had to take up yoga, get massaged, and so on.

Years later, I was at U Pandita's place in Rangoon, Panditarama. The interpreter was a relatively junior sayādaw named Vivekananda, and the teacher—the person who was giving the interviews—was not U Pandita but one of his underlings. He'd have to be in the running for the worst meditation teacher I've ever come across. He was just dreadful. He had no interest whatsoever in what was going on. I doubt that he really paid much attention to what anybody was saying to him, and he just kind of tossed off whatever standard response came to mind at the time.

So with me, I would go to an interview, and if something interesting was happening—and I had been doing the practice long enough to figure out what was interesting and what was not—then after the interviews, I'd go and see U Vivekananda, go to his hut, and we'd sit down and I'd say, "OK, what was that all about?" We'd have a discussion, we'd have a talk. He would be pulling down books and we'd be reading them and comparing notes and figuring it out. It was a very interesting process.

But in the course of this, one day I was complaining to him, as was my wont, about one of my major obsessions when I meditate, which is: I haven't got enough samādhi. My concentration is not good enough. So I was complaining about this, and he said, "There is nothing wrong with your samādhi. You would not be seeing the things you are seeing if you did not have samādhi. It's not samādhi you lack, it's passaddhi."

"It's what?"

"Passaddhi."

"What's passaddhi?"

And of course it's tranquility. It's one of the factors of awakening—does it come third? Is it number three? Four. Yes, it's four. And it's just next to samādhi, just next to concentration.

Passaddhi and samādhi—it's interesting, it's one of these pairs of terms that you come across in the Buddha's teaching where there's a body-mind connection built into them. That is, one term is predominantly physical but also influences mind; the other

term is predominantly mental but also influences body. In this case, passaddhi, tranquility, is predominantly physical, but it influences the mind, while samādhi, concentration, is predominantly mental, but it influences the body.

In other words, my body was agitated. I was carrying chronic tension within the body, and the body was always tight. And if the body is agitated, it's quite difficult for the mind to settle. Not impossible.

And people do it. But it's like running with a handicap.

So one way into samādhi, concentration, is via the body. Calm the body down, bring ease to the body, and then concentration will develop. On the other hand, if the body is agitated, it will be difficult to calm the mind. This is the mind-body relationship. The body is important as part of the instrument with which we practice meditation.

When we begin intensive meditation practice, it's been my observation—and it's not just me—that a lot of people spend a great deal of energy fighting their bodies, trying to make them do what they think they're supposed to do. For example, to sit in a particular approved posture.

I mentioned that I spent a number of years practicing Zen. My introduction to it came about, oddly enough, through a kind of half-hearted attempt to make a connection with Tibetan Buddhism. I had returned from my first trip to India in late 1977, looking for an opportunity to continue meditation practice in Sydney while also needing yoga, massage, and so on. There was an advertisement for a public talk to be given by a visiting Tibetan Lama at a hall within walking distance of my house, so I went. I think it was Lama Zopa—he would have been very young in those days.

So there was this young lama on the stage. A good crowd turned up, and he had these gorgeous robes. He sat down and gave one of the most boring Dharma talks I've ever heard. So you see, definitely, lamas can be boring too. At the end, they handed around a little pamphlet advertising a weekend retreat with this teacher at a house or centre in the upper North Shore, so I went along.

It was a weekend of meditation, very good. I went through the whole thing but didn't connect with the teacher. I was sitting in this hall with this really crappy little cushion, trying to sit properly, when I happened to glance to my right. Beside me was this magnificent Rolls Royce of a cushion. I looked at it and thought, "I've got to get a cushion like that." Then I looked at the man sitting on it—he had a perfect full lotus, a totally straight back, and a perfect mudrā. I thought, "I've got to get a posture like that." Can you get it at the same store?

I was too shy to actually go up and say hello to this fellow because he obviously knew what he was doing. But after that retreat, I put my name down on a mailing list, and the only thing that ever came was an advertisement for a yoga class run by a man called John Cooper. I went along, and there in the class, doing magnificent postures, was this same fellow with the cushion. I knew I had to pounce on him because my enlightenment depended upon it.

As it happened, at the end of the class he made an announcement saying he was running a little Zen group in Sydney and inviting people to come along. This was the Sydney Zen Group, so I joined up. The man was Lee Davidson, who currently lives on the North Coast and is the founder of Australian Zen.

I went along to Zen, attracted initially because they had the best cushions and only sat for thirty minutes. When Aitken Roshi came out later, he reduced it to twenty-five, and the Dharma has been declining ever since. But I only had to sit for thirty minutes, and the instructions were to follow the breathing down here in the belly, which was much better than what I had been doing up here in the head. I could sit facing a wall with the light blasting into my eyes, so I could keep awake.

I got into Zen. I used to read these Zen books—little "Zen for Beginners" books coming out of Japan—and they always talked about posture, the importance of posture. "Sit like Buddha and you will become Buddha." They always had photographs of these good-looking young Japanese men with shaved heads and black robes demonstrating perfect posture. Of course, I thought the job was to sit like them, and so that's what I tried to do. Years of struggle. And the struggle itself, of course, gets in the way of the meditation.

But the other strange thing is that the posture I was struggling to attain was nothing more than a product of my imagination. It existed only in this mental image I had of it. I was already alienated from the body. It was as if I was residing outside the body, and from there I was trying to make the body fit my image of what it was supposed to look like from the outside. Does that make sense? It's a completely alienated relationship. But I was so busy struggling to get the right posture that I never noticed.

At some point it occurred to me: how would the experience of sitting change if I abandoned this struggle and yet found ease in the posture? At the very least, it would improve samādhi, concentration. At the very least, it would do that. But it would also assist vipassanā, insight, because insight requires a subtlety and precision of awareness. If my relationship to the practice is so gross that what I'm trying to do is wrestle with the body to keep it still over the approved period of time, it's difficult for subtlety and precision to arise. Again, it's not impossible. With enough struggle, it can be done—slowly.

Painstakingly slowly—but it's not a very efficient way to practice.

So the simple fact, which we tend to lose sight of, is that we are bodies. That's what we are. But we need to be reminded of this from time to time because our minds have the capacity to separate us from our bodies. This is something about the human mind—perhaps no other species has this capacity. I don't know; we may be the only one. But certainly in our species, our minds can separate us almost entirely from our bodies. In the ordinary everyday experience of this, our mind manages to persuade us that our drives, our desires, our fears, our hatreds, our anxieties are actually more real than the body.

Now from the Buddha's point of view, each of us is a sentient body. He calls it *satvijñānakāya*. *Kāya* is body, *vijñāna* is awareness or consciousness, and *sat* means "with." So a body with awareness, an aware body, a sentient body. Notice that he's saying our fundamental nature is not some esoteric mind state or spirit or whatever—our fundamental nature is this, physical, the body. But the body is sentient, and it knows, it is aware of, a world external to itself, which appears to be inhabited by other sentient bodies, shared by others. And there's another world, which is internal, known only to ourselves. We call this the mind, or the Buddha would call it the *citta*.

Now this awareness of the sentient body, as we mentioned before, is located. It has location. It's located here. *Here*. I am aware of this room—from where? Here. Where are my thoughts happening? Well, they're not happening over there. They're happening here, somehow. Even if I can't pinpoint the location, still I have this sense that it's here.

The power of the inner world, of *citta*, of the mind, enables us to escape from this sense of being located here. Have you ever had the experience of sitting in a meditation hall—let's say this one—being lost in imagination and thinking yourself to be somewhere else? Or has that only happened to me? Have you ever had the experience of being lost in thought and thinking yourself to be in the past or in the future, rather than now? Constantly? And when you consider this, it's seriously weird. But it shows us how powerful the mind is in its capacity to separate us from the body.

I can project myself into past or future, and it's more real to me than this. The classic example in meditation retreats is when we first arrive, and the past, the world we just left, is actually more real to us than here. Then we go through a period of time when we're actually here. And then once the mind starts to think, "Hey, wait a minute, it's coming to the end"—whammo—the post-retreat world is more real than here. It's so routine we don't notice it, but it is seriously strange. And similarly, situations other than here, somewhere else in the present, are more real than this.

Now these worlds are purely conceptual. They're just made up of concept. And it's within these conceptual worlds that I create an identity. I create myself in these worlds. And perhaps that's the only place I can create an identity. Maybe that's why I need these worlds.

The self, the identity that I create, can never actually escape its physicality. It's always here, even if it doesn't want to be. It still lives in this body—even though it would much prefer another.

It makes no difference. Here it is. It's inescapable. Everything happens here, and yet we live as if we are separated from here.

Consider walking meditation. If I'm walking up and down a path fully engaged with the practice, the here-ness of this experience is quite clear. It's evident to me that this is happening here. But when I get lost in fantasy, while objectively I'm still here—people can see me—the felt sense of the here-ness of the experience is completely lost. And then I come back to here, I drop the world of fantasy, and I'm here again. So I find myself here, then somewhere else, then here again, then escaping somewhere else.

We get the same dynamic with emotion. When I'm sensitive to the feeling tone of the body, I find my emotion resides here as physicality, as body—basically as a set of physical sensations that might be quite disturbed, and they're here. The mind, from these sensations, creates a conceptual world. The body is disturbed, and the mind has to make sense of it. So it interprets it as a certain emotion: I'm grumpy, I'm upset. And then the mind, in that conceptual world, has to find reasons for being grumpy. There must be something happening in the conceptual world that's causing this.

So the mind goes through the files, picks out the appropriate one, makes that situation real—more real than this—and this confirms the disturbed sensations and feeds them. The sensations feed the emotion, and the whole thing perpetuates itself. The more I get lost in the immersion, the more my sense of reality drops away from this into the imagined conceptual world. Now this world may be located in the past, in the future, or in the present but away from me—triggered, for example, by other meditators. But the sense of the here-ness is gone.

When I'm intimate with the body, it's quite clear to me that this entire drama is occurring here. And when that perception is clear, I cannot sustain the emotion because I cannot sustain it without this imagined world being more real than this.

The mind is remarkably anxious to get away from the body. Sometimes because the physical world is painful. The body hurts. Everybody hurts. Sometimes you have just the normal physical pain of the body, but you can also have pain in the body that is ac-

tually created by the world of concepts. I think of something emotionally painful and I feel it in the body. The body then hurts. So of course I want to send the awareness away, perhaps to argue with that conceptual world. But again it's getting out from the body as much as possible.

So it's no wonder that we have a problematic relationship with the body. We get cut off from it, become strangers to our own body, and lose our sense of the body's language. We don't listen to it. We can't hear it. We can't understand what it's saying.

Most of the time we're in a world of language, of concept—what we normally call language, the blah blah blah. Language in this sense takes us into the world of concepts. The body also has a language, but its language is non-conceptual, restricted entirely to sensations. The body speaks in sensation. That's how it communicates.

We tend to be deaf to this language. We receive messages from the body only when these messages are very loud and very crude—such as, for example, that hurts. Or when we get sick, when we drive the body so much because we're so caught up in the world of concept that we push the body beyond its limit. It's interesting how many people, when they go on holiday, fall ill. The body doubtlessly has been complaining for some considerable time, but we're completely, totally oblivious to it. The world of concept overrides it. No, I have to do this. But when the pressure is released, the body shouts out its message, and the message comes in the form of sickness.

So the body is always communicating, but it can only communicate in sensation. On the basis of the sensations we create perceptions, and on the basis of the perceptions we then create thoughts and so on. These perceptions are often false. The sensations are always true. The body never lies. The mind lies all the time, but the body never lies. Everything that it says is true—although the perceptions and thoughts and concepts that we create about that language may well be false. But the sensations themselves are always true.

This is one reason why in our practice we are urged to slow down. Because if we slow down, we have the opportunity to tune into these sensations. We're in the habit of blocking them out, and speed is one way that we do it. It's not just speed in itself—it's the speed which is triggered by the attempt to make real an image of the future.

Now, this can be quite mundane. Let's say there's a particularly nice lunch, and mindful of the body I scoop up a spoonful of this particularly nice lunch. I have an image of the satisfaction of eating it, and so the movement from here to here is as fast as I can manage it without actually hurling the food across the dining hall, which would be

embarrassing. Basically what's going on is I've got an image of what I want within the body. The body is somewhere else, so I just have to move it as fast as possible from there to here.

Another example: if you're doing a strong stretch in the morning and you get the signal, "Okay, enough," how quickly do you back out of it? And why do you move that quickly? Isn't it because the mind rushes to the image—"this is over, so the body should no longer be like this, now it's supposed to be like that"—and it just goes, bang, there, as fast as possible? In that movement, what's real is not the body, in other words not the sensations, but the mental image. The body is racing to catch up with this. But we're not actually listening to the body; we're listening to the image, to the concept.

That's why we keep saying, when we go into a stretch and when we come out of a stretch, move slowly—to maximise the sensations, to listen to what the body is saying about this whole thing.

Similarly, the big mistake that we make when we're doing these stretches is to push too hard. When I'm pushing too hard, I'm trying to get the body from here to here. In that movement, what's the language I'm listening to? It's the concept. "The body's supposed to be there, so bloody well go there. And we'll talk about it afterwards." Scrunch. But if we're actually listening to the sensation, there's no way we're going to injure ourselves. Because the message will be loud and clear: "Stop here. This is far enough. Thank you very much."

So the whole business about slowing down is very largely to give us the opportunity to start tuning into the language of the body, which is the language of direct sensation.

When we do this, one thing we discover is the tension that we hold in the body. When the mind senses danger, the body defends itself. It defends itself by tightening, ready to ward off an attack or to launch into one. So tension always arises as a defense mechanism to a perceived threat, to a perception created by the mind.

Now, concept tends to last. I have a concept of something and that concept can last for a long time. I can make up my mind about something and ten years later I have exactly the same opinion. So the mind perceives a threat and then can believe that this threat remains, even when it's actually over. But the mind can be convinced that there's still a threat. This message is sent to the body, and so the body continues to hold the tension. These patterns of tension become habitual. They drop beneath awareness and we don't notice them anymore—except when we try to move the body and we discover that it won't move in the way that we wanted to, because suddenly it stops. I can't go any further.

Sometimes we sense these patterns of tension. Sometimes they're evident—we feel tightness in the shoulders, for example. Sometimes we experience them as areas of absence, the complete absence of sensation. In other words, the language here has been completely shut out. There's no sensation in this part of the body at all. And here, I suspect, is the deeper tension.

Sometimes, if you're doing a stretch, you start to move into an area, and it's not necessarily painful, but you get this message from the body: don't go there, back off. It's not necessarily a sensation—the sensation is still beneath awareness. But the message it's sending is so strong that even the mind can start to pick it up.

So we have these habits of tension held in the muscle and the fascia. These patterns of habitual tension create my sense of my body—my body that has these limitations, my body that can't sit comfortably. They condition the sense of reality, the sense of what's possible and what's not possible. All of this gets taken over by the world of concept and becomes absolutely fixed. And these concepts feed the body. And the body tenses because that's what it's told to do. So we find ourselves locked in.

This is the body that we struggle with when we try to do meditation practice. And of course this is why we do the body work as part of the meditation.

Now, if you're inclined to orthodoxy, you might be tempted to ask: did the Buddha and his students do body work? And if you're a learned scholar in these matters, you might say, "I've studied the suttas and I can find no reference to body work in there. So why are you doing it? This is heresy." Extending his arm, the monk extends his arm; bringing the arm back—it's certainly being mindful of the body, but is it doing body work as such? You could argue it is. You could certainly get a good lawyer and make a case for it.

But the Buddha didn't do body work, it seems—though he certainly walked a phenomenal amount of distance. Thousands of kilometers. And this is extremely relevant to what we're coming to here.

There's certainly no explicit reference to body work in the suttas that I've come across. Strictly speaking, the answer is we don't know if the Buddha and his students did body work or not. And we cannot know. But we have to consider the context.

First of all, traditions do not transmit the blindingly obvious. This is the first thing. If we're looking back into the past, trying to work out what was going on—back during the Howard years, we had the history wars. And during that time, I remember reading a book on this, and there was a quote from the famous Australian historian Geoffrey Blainey, who wrote *The Tyranny of Distance*. He made the comment that if you are a his-

torian, your job is to go back to the records left by people in the past and from those records work out what was going on for them in that world. And he said there is of course one thing that is never mentioned in historical records, and that is precisely that which for these people was blindingly obvious.

When we make a record, do we record the obvious? No. Why would we? It's obvious. So we don't make a record of it. In later times, when people are trying to work out what we were experiencing, what they will not have a record of is what we thought was completely obvious.

So the fact that the records don't mention certain things doesn't mean they weren't there.

They could mean that it's so obvious that there's no need to talk about them.

Was yoga being done at that time? Well, there's no reason to suppose it wasn't. The word was used. The kinds of practices we associate with yoga were being performed. So there's every reason to suppose that there would have been a yoga tradition there at the time.

The other thing, of course, is that the people of that time and place were far more physically relaxed, supple and robust than we are. Enormously so. They came from a non-mechanistic agricultural society where there were almost no machines. Everything was powered by human or animal muscle. They lived on the floor without furniture. In the case of the bhikkhus and bhikkhunis, as Jane mentioned, they were used to walking long distances most days of their lives, in bare feet normally, in a very relaxed manner.

So these were people who were both extremely fit in our sense of the word, but also much more in their bodies than we are. Their relationship to the body would have been completely different from ours. Their bodies would have been much more open and relaxed than ours, and body awareness would have come much more easily and readily to them than it does for us.

Consider the contrast with how we treat our bodies. The body adapts to whatever posture it's forced to undergo over a period of time. And our basic posture is sitting in a chair—and if we're at work, hunched over, staring at a screen that's very close to us, maintaining that really artificial, out-of-balance posture for hours every day. And all the way through, it's associated with stress—in other words, threat. I'm at work. I've got to do this. Not much time. I have to be productive. My review is coming up in a couple of months' time. And if I'm not productive, they'll sack me. This is what we're telling our bodies for years, even decades at a time.

So it's pretty obvious what happens. I come to a meditation retreat, I sit down on the floor, and what do I discover? I'm incredibly stiff and it hurts. Hardly surprising. Plus the world we live in—our minds will be spinning around a lot faster than the minds of people in simple village pre-literate cultures. And of course in material capitalism we live in a society in which social isolation and competition between individuals is endemic.

So we have a completely different relationship to the body. We bring this completely different relationship with us when we start doing meditation practice, and it is a long way from being helpful—as well as totally different from what the Buddha and his students would have experienced.

If we look at how the body was related to back in those days, I'd like to refer to one story that we find in the Chīvarasutta, the Robe Sutta. This is about the Buddha's disciple Mahā Kassapa, or Big Kassapa. "Mahā" could be translated as big, so Big Kassapa. Maybe he was a big guy. In Sanskrit, Mahākāśyapa. He was a senior disciple of the Buddha and was well known as an ascetic—one of the major ascetics. He lived in the forest. He devoted himself to practice. He avoided the kinds of social entanglements that were part of the Buddha's life and part of any monk's or nun's life who spent time with lay people.

He had a reputation as a very fierce disciplinarian. There are these wonderful stories about him absolutely putting the boot into Venerable Ānanda for being slack. And in the tradition, he's come to represent tough, macho Dharma. He was a bloke's bloke when it came to the Dharma. He's also the one the Zen tradition regarded as the first ancestral teacher—he was the one who received the transmission, the mind-to-mind transmission, from the Buddha.

So in the Chīvarasutta, Big Kassapa is an old man, and he's recounting his memories of his first encounter with the Buddha. Now, before he ordained, Kassapa was a wealthy farmer. One day during the harvest, he was supervising the workers in the field and he suddenly saw that in the process of harvesting the crop, innumerable small creatures were being killed. He was overcome by remorse and horror at this and decided he had to renounce the world. Which was a bit of a worry because he was married, and the couple were very fond of each other.

So he went home wondering how this was going to pan out. But as it happened, his wife, who was at home supervising the winnowing of the grain, had the same realisation, and with it the same determination to renounce the world. She was worried about how she was going to explain it to her husband. So when they met and discovered that they were on the same page, they were very pleased.

They ordained themselves and walked off together. At some point they came to a crossroads, and Kassapa turned to his wife and said, "Look, we're ascetics now. It's inappropriate for a man to be walking with a woman, so we should go in separate directions." And she said, "That's a very good idea." And they separated. And Kassapa headed off in search of enlightenment.

Now, probably some of you would want to know what happened to his wife.

Her name was Bada Kapilani, and she went to Savatthi, which is the capital of the kingdom of Kosala, and she went to Jetavana monastery, which was the Buddha's headquarters. She hung out there and listened to the teachings. But this was quite early on, and there were no bhikkhunis in those days. So she actually joined a local nunnery of non-Buddhist female ascetics, because there were nuns in other traditions at the time. After five years, the bhikkhuni order was created and she was able to ordain as a bhikkhuni. Not long afterwards she became fully awakened, and thereafter she specialised in the education of younger bhikkhunis, particularly in Vinaya, the monastic discipline. The Buddha praised her as foremost among the bhikkhunis in her ability to remember previous lives. So presumably her mindfulness was pretty powerful to be able to do that. She was okay.

Kasapa, on the other hand, is walking down the road when he meets the Buddha. Actually, he doesn't quite meet him. The Buddha is coming down the road and decides it's time to sit down for a bit. So he leaves the road and sits underneath a tree, meditating. Kasapa comes down the opposite way and sees this ascetic sitting under a tree, and immediately knows: this is my teacher. He goes across and they have this encounter, and the Buddha promptly recognises him as a good quality student. So they get together and make a connection.

The Buddha gives him three practices that will define him the rest of his life. The first is all about the practice of ethics, sila. The second is his devotion to the study of Dharma. But it's the third one that I want to focus on here. The Buddha says, "Kasapa, you should train yourself in this way: I will not abandon mindfulness immersed in body, associated with joy."

The instruction here is first of all always be mindful of body, and secondly to do it in such a way that the pleasure of it is evident.

Whenever I've seen statues of Ananda, he looks quite calm and serene, but someone mentioned that every time they've seen a statue of Mahakasapa, he's grimacing—really, really grimacing. He's the fierce old forest ascetic, the tough guy. But apparently he was a very joyful tough guy.

That actually comes out in the Zen tradition, because when the transmission occurred, all the students were assembled for a Dharma talk. They're waiting for this learned Dharma talk, and the Buddha held up a flower. All the students are kind of staring at him, thinking, "What, has he found his inner hippie? I hope he didn't break Vinaya by picking that flower. When is he going to start talking?" And in the whole audience, only Mahakasapa—and the Chinese translates it as "cracked a smile"—it's like his whole face cracked open with a smile when he saw that flower. The Buddha saw the smile and said, "You're the only one who's recognised the Dharma." And Kasapa got the transmission.

So he's got both aspects. He's this fierce, uncompromising, macho ascetic, and he's got this joy about him. It's one of the things that makes him so interesting.

When you're speaking about joy here, are you meaning the same joy that you talked about with rapture as a factor of awakening? Isn't rapture what comes before joy, before passaddhi?

Passaddhi is the fifth factor. But the word used here is not rapture. The Pali word is sukha.

Sāta. S-long-A-T-A—pleasure, joy. This is apparently a standard word for joy. It's not a technical term like rapture; it's just joy, pleasure.

So always be mindful of the body in such a way that a pleasurable connection with it is evident. The verb translated here as "not abandoned" is *vijahati*, which can also mean "to give up"—in other words, to not give up. So even when you go through periods where you forget the body or you cannot feel any joy associated with it, still make this relationship central to your practice. Learn to recognize what disconnects you from the body and the joy associated with the body. What gets in the way of the pleasure? Learn to recognize that when it's not there.

Also, similarly, *vijahati* can be taken as "to dismiss." So do not dismiss the role of the body in your awakening. Do not think that you've somehow transcended it.

The Buddha gives Maha Kassapa this very brief teaching which contains an enormous amount, but he makes it clear: the role of the body is absolutely central, and within that, the role of pleasure is absolutely central.

I was reminded of this through my work with Kit Laughlin, who is my bodywork guru. When he's teaching, he demonstrates a posture, and as he does it, he makes these strange sounds. He goes, "Ah, that feels great!" He ties himself into some impossible knot. "Ah, fantastic, that feels fantastic!" I used to look at this and think, this guy, he's

just laying it on. He's trying to encourage us because when we try anything like that, it's excruciatingly painful. At some point I realized it's actually the truth—he genuinely does feel this pleasure. And as I've come to know him, I've realized this is a man who is constantly feeling pleasure from the body. It's just his normal state, because he fully inhabits it. And therefore, it's pleasurable.

We do that when we go to our cushions in the morning. Also, when we do a heavy massage, for example, it's sometimes quite painful, but it feels really pleasurable at the same time. It's physically painful, but it's pleasurable mentally somehow—it's very satisfying. It's like when you get a really deep massage and it really hurts because it's fantastic.

But to me, bodywork is very largely the task of finding pleasure and ease in the body. If I'm doing bodywork, that's what I'm trying to do. It has to do with the relationship with habitual tension and the relaxing into it. And that has to do with the quality of the awareness.

Take the example of massage. Getting a deep massage is painful but pleasurable. I find that as soon as I start to resist, it's just painful. But if I'm not resisting, if I'm surrendering to it—yes, there's a painful quality, but there's a deeper pleasure. I find the same thing in stretching, in bodywork. This is why the standard instruction you get from me is: find the tight line, breathe, and relax. It's about putting the body in a particular form and then relaxing the awareness into it.

If there's a relaxation and a sensitivity of the awareness, first of all the sensation becomes clear. We can actually hear what the body is saying and not get it mixed up with the perception. And by relaxing into it, the pleasure which is available emerges. With that, the body stretches out. It gives way, it surrenders, it lets go. It recognizes the absence of threat. And in that recognition, it relaxes.

The function of pain, of course, is to recognize threat. It's like when I was a chasseur, for example—there used to be a difference between playable pain and painful pain.

And I know I'd be going in somewhere and you could see from the response of the individual I was massaging, or just feel it, that it was painful pain. It wasn't right to go in there. And if you're feeling it, you're feeling the tension, the resistance. Well, I was feeling the tension, but I was also feeling resistance. But it was a healthy resistance. It was the body's response saying, this is painful because pain is the response of the body to danger. If you go in more, it's going to cause harm.

And for practical purposes you've always got to be able to distinguish between these two. Certainly sometimes people who are too keen in adopting the right posture don't recognise this. They have the underlying tension unconscious and so the body is tight. Pain comes up and people cause damage. So it's always about the quality of the awareness. And if you need to back off, you know you need to back off. And that's what you do. You back off, particularly in the stretching, when you recognise the danger signal. This, again, is the language the body is speaking. And so you just back off just a little bit. Just enough. And then relax.

Finding the right point at which to relax is absolutely central, and that requires the sensitivity of the awareness. If you find the right point, the relaxation will occur. The body will drop its defence mechanism and just do what it naturally can do. So Kassapa must have become an expert at that. Yes, I would say so. I suspect he would have been a good masseur.

There's also this quality of fierce joy. You can be fiercely joyful. In our current culture you might think of an evangelist—someone who is very evangelical about spreading the word can be very fiercely joyful, really having a good time whilst being extremely fierce. So fierceness doesn't necessarily have to be a negative thing or an unpleasant thing or a painful angry thing. Footy players—we need say no more.

So this work of tracking the body is foundational, not in the sense that we do it first and then move on to something more esoteric, but foundational in the sense that the floor is foundational. Here we are on the floor, and it's not that we're going to at some point start floating above it. Well, you might. But the rest of us, it's unlikely.

Actually I met a monk in Thailand who taught mettā meditation and he claimed that one day he was sitting with his eyes closed radiating mettā and he started to develop a headache. And the headache progressed. And he noticed that the headache was strangely located only at the top of the head. He opened his eyes and he realised he had floated up and was pressed against the ceiling, and the spell was broken and he fell to the floor. I have to admit I didn't believe a word that he said. I was a bit suspicious of this particular monk.

So I can be working with the citta, with the mind, in very subtle ways, but when I'm doing it—where am I doing it? Here. When am I doing it? Now, in this body. There's a groundedness to the relationship to the body.

Take for example thinking. There's a world of difference between thinking of the future knowing, sensing that I'm doing it here and now, versus thinking of the future when I'm actually doing it in the future. It's a world of difference between the two. The body provides this here-now groundedness to our experience, which is completely foundational.

Let's take the whole project of meditating. Let's say that I'm told what you have to do is sit down and watch the breathing—this being a not uncommon instruction. Now I hear this through and as concept. So I've got a concept of the job that I'm supposed to do.

First of all, I have to sit down and follow my breathing. That's the job. But notice: the "I" that has to sit down and follow the breathing is itself a product of concept. There's someone who inhabits this body, quite mysteriously, who now has to attend to some aspect of this body—the breathing.

So here I am, more or less floating around this body, reaching out for my familiar world, which is the world of concept, where breathing intrudes only as an occasional visitor. I speak from experience in this case. And from that world, I have to make contact with the breathing and then stay with it over a period of time. It's bloody hard work. I know from experience. It's quite difficult.

But what if I simply allow the body to be sensed? It's already speaking to me. There's already sensation. What if I simply allowed a sensing of myself to sense this body? And this sensing includes the movements within the body that we call breathing.

So this is a whole different project. This is the project of, first of all, blocking our conceptual preoccupations, dropping the preoccupations that block intimacy with body. It's the concepts that are getting in the way, including the concept of "I'm supposed to be sitting here meditating." That too gets in the way.

And it comes about through relaxing tension. Because tension represents the basic way of separating from the body. Or look at it from the other way: the body withdrawing, because it's closed in on itself. And the only messages coming out are danger, danger, danger—don't go there, don't go there, don't go there.

So the way in is through intimacy. Intimacy requires relaxation, and when there is intimacy, breathing appears. And so does everything else, for that matter. And intimacy cannot be forced. It comes about through relaxation into tension. Find the tension and relax into it. Tension is resistance, and resistance is fueled by fear and rejection. So the

practice of finding the clinging, finding the tension, the holding, and relaxing into it dissolves that sense of paranoia, essentially, and the clinging that's associated with it. And this leads to intimacy.

This whole relationship to body—for example, establishing a meditation posture—we have to learn to do it from the inside out. What we normally do is we do it from the outside in. I have a concept, an image of what the body should look like, and I then try to force the body into fitting that image, to conform to it.

So, for example, one obvious case: I'm told I should not move. So I force myself to be still. And this very force increases tension in the body and increases a sense of alienation from the body. I actually find myself complaining about it: "My body won't do what I want it to do." So here's me and there's the body. And they're obviously separated.

What we want is to create a posture from the inside out, feeling our way into sensation and the ease that's available, that's characteristic of the body that's fully inhabited by awareness. In other words, mindfulness immersed in body. So the way in is through feeling and relaxation, finding the sensation and a sense of ease and balance from inside, and then making adjustments from there—not thinking about what it looks like, not looking at it from the outside, but feeling it from the inside.

And the whole role of the bodywork that we've been playing with in the morning—it's not something that we do to aid the meditation. It is meditation. This is really a fundamental point. We bring the same sensitivity and the same awareness to these movements as we do to the formal sitting meditation practice. It's not something that we do before the first meditation period. It's something that we do before the first sitting period, yes, but it's not what we do before the first meditation period. It is a meditation.

And the more it becomes that—the more we feel it as a meditation—the more we find awareness starts to actually spread out and inhabit the body. And when that happens, the body relaxes, and everything flows from that.

Is that any different than what you mean when you say, when you sit, the first thing you do is establish a posture?

Yes, establishing the posture is part of this whole process. Sometimes I like to ask students: When does the sitting period begin? In my early days, when I did Zen, we had these elaborate rituals of the bells. And you could always time the exact moment that the sitting period began. It was like when that final bell hit.

Because the rule was, from that point you can't move. They'd have three bells to begin a period with a certain number of seconds between each bell. And the first two bells, that period, was the time you could kind of get yourself settled. The third one goes, that's it. No more movement. So I had this sense that that's when the sitting period begins.

These days, for me, the sitting period begins the moment I begin to sit down. Because from that moment onwards, I'm constructing a posture. By the time I've done it, I am already meditating. There's nothing to begin. I've already started. And it's quite a natural and seamless flow. Similarly, the moving meditation begins as soon as I start to move out of the posture. I'm already doing the moving meditation.

A student raised a dilemma about pain in meditation, particularly knee pain, and the question of whether to continue going into painful sensations with awareness—which can be very productive—or whether one might be causing damage.

This is the essential point: if there's injury or the threat of injury, then it's ludicrous to go through the pain. And that's why, as a practical matter, a meditator has to learn to distinguish between the two.

As a rough rule of thumb, be really careful about knees. They're easy to damage. The pain we feel in the knee in most cases, if we're sitting cross-legged, is because of inadequate flexibility in the pelvis, the hip, and the ankle. So if I'm sitting cross-legged and I've got pain in the knee, this is referred pain, and it may be that I'm not actually addressing where the stiffness actually is, that I can't feel it. It's vanished. It's so deep, it's completely absent.

So in practice you've got to be particularly careful about knees, and especially if there is in fact already an injury. I've got an injury in the left knee, and I'm very cautious with it. There's always got to be that care—if there's an injury you've got to be really careful. And in practical terms you've got to learn when the sensation is telling you to back off or when the sensation is an invitation to keep going. How to make that decision, you develop over a period of time.

The first lesson I got in this was when I was doing my first three-month retreat at the Mahasi Centre. We sat for an hour, which was hard for me, and it got to the point where the last ten minutes of every sitting was really painful in the knees—actually, mostly in the left knee. But I would religiously not move until the period ended and just note pain.

And then one day, instead of pain arising, bliss arose. The legs felt blissful. And I thought, that's it, I've got it. So I would just happily sit there. The retreat ended, and I was running around, organizing my way out of Burma, flying to Bangkok, finding a hotel. And the first time I sat down to meditate, as soon as I crossed my legs, it was excruciating. I had definitely damaged something. But it was covered over with the bliss of samādhi.

Someone asked if the damage might have come from all the running around rather than the sitting. But all I was doing was just normal movement, so I don't see why that would have caused damage. I suspect I just pushed it too far. But all the danger signals of the body had been obliterated by the power of the samādhi.

that convinced me there was no problem. A false message. So it can be really tricky. In practice, you've got to be very, very careful. You've got to pick your ground where you choose to stay. And also, the whole thing about backing off is important.

If the awareness is clear enough, you can move forward to a position where you're getting a sensation, and the language, what you're being told, is "back off." You back off just enough and then stay there. But how much is just enough? At what point do you hear that message correctly? It's not automatic. There's a sensitivity that you have to cultivate around this. I think there's an art to it.

I haven't sat cross-legged for years, but I've been sitting a lot in this retreat and getting a lot of the time without any pain at all—less pain than I've had for years, actually. And I think there's a reason why I developed a problem with my knees. In a way, those things are coming out in the meditation, often in relation to sensation. I think it's been a really productive process, and I think my knees are improving through this process of doing all this cross-legged sitting. But I'm doing it differently—I'm coming from a different place emotionally. So is the emotion attached to the sensation important?

Well, I think factoring the damage was all of this sort of over-determined, effortful approach and everything associated with that. So it's all part of the package.

I find—and we talked about this before—how the basic model is dependent arising, which is multi-dimensional. The thing is to find a way in. Once you're in, then everything starts to open up. Different people have different ways in, but once in, different people will find themselves heading along different trajectories.

And certainly in terms of body-mind connection, what we call the emotional aspect of sensation is really important. Because the body locks in certain patterns, and these can be associated with particularly held emotions. Plus, the quality of effort is always really important. Too much effort smothers the sensitivity that you need for this kind of work.

I have a question about body pleasure and finding a way in. It's probably conditioning, but most body pleasure that I can recall in my life has to do with things like massages or other activities I don't do anymore. It's hard to find a way in to pleasurable sensations in the body. Pain is really obvious, but can you suggest any ways to notice or find pleasurable sensation in the body?

Is there anything pleasant about sitting there now?

No.

Nothing at all?

No.

When you step out and look up at the night skies, is there anything pleasant there?

The seeing is pleasant.

And that's part of body?

Oh, okay.

So the pleasure of the environment can kind of filter into the body if we let it.

There's a very good book by Rick Hanson called "Hardwiring Happiness." It's all about noticing pleasure, noticing joy, how to cultivate that. We tend to—he's a neuropsychologist, and he's talking about how we have a mental filter. We tend to look for pain and fear, look for things that are dangerous. Instead of that, we need to look for things that are enjoyable. I remember hearing someone say that a key to jhāna, for example, was to notice something pleasant about your meditation sit. Like if you're breathing, to notice something pleasant about the breathing. And then as you notice that, it gets stronger and stronger, and it starts to develop your concentration. It's about taking in the good, focusing on the good, focusing on the pleasure, even if it's just a minimal thing in the distance. The more you focus on it, the more you can see. Rick Hanson talks about that. He's a Buddhist, and he's quite good.

Yes. But can I recommend you start enjoying the place, the environment and the situation of being here. No particular stress. Nothing particularly you have to do.

It's quite an interesting place. Quite beautiful. The weather is pleasant. Really good showers here—a nice warm shower is wonderful. And sitting in the same room as the Buddha is nice, isn't it? Yes, that's nice.

So basically, it's like learning to retune the radar. If the radar is habitually seeking out danger and pain, then you've got to redirect it toward pleasure. And this pleasure isn't necessarily in the fifth sense of touch. It could be more in seeing, hearing, smelling, or minding—overall vedanā. Not necessarily touch sensation, but it can start to filter into that domain as well.

I once was seeing quite deeply and I read Ajahn Sumedho's book, and he said something about welcoming dukkha, and something really clicked. It wasn't just understanding dukkha, but *welcoming* dukkha. That was pretty amazing for me.

You said something, Patrick, about letting go of resistance in relation to physical tension. But it applies to everything, doesn't it? The process works in the same way?

Yes, and letting go is interesting because it's not doing something—it's ceasing to do what we habitually do. I can't let go in the sense of "I'll just do letting go." It's actually a kind of waiting. There's a certain quality of waiting, and at some point I stop doing what I normally do. And that's the letting go.

Does it come back to not being afraid of pleasure?

Yes, we're going to get to that in the not too distant future. We're going to have a talk about that.

You mentioned it already, didn't you?

Yes, but I'm going to talk about it more.

Why is the sutta called "Jīvaka"?

Because Kassapa had a robe that he had brought from home—he had ordained himself. And the Buddha had this old rag robe that he'd sewn together from cloth found in a charnel ground. When the Buddha was giving Kassapa his ascetic practices, he said, "Take this robe. Use this robe." And Kassapa said, "Oh no, you need a robe, so take mine." So they swapped robes, and it's the only recorded instance of the Buddha giving his robe to someone.

This was taken up in the Zen tradition, where the reception of the robe became a sign of transmission. In Zen they have the story that he received the robe and the bowl, and of course in the Pāli tradition he did receive the bowl.

Do you remember when that was? When the Buddha died, word was sent to Mahākassapa, and he came as fast as he could from the forest, but the Buddha died before he arrived. All the lay people gathered to burn his body, but the devas wouldn't let the fire start because Kassapa hadn't turned up. So Kassapa arrives, circumambulates the pyre, bows to the Buddha, and it spontaneously bursts into flames. You can see the traditional paintings of Kassapa bowing to the recumbent Buddha with the pyre and flames.

Then Kassapa collected the ashes in the bowl, and he was the one who distributed the relics, but he kept the bowl. And of course, to complete the story, he didn't actually die as an old man when his life was naturally coming to an end. He entered a mountain —the mountain opened up and he walked inside, sat down, and the mountain closed. When the next Buddha comes, the mountain will open, he'll emerge with the bowl and the robe, and offer them to the next Buddha.

It would be good to witness that encounter and to question Kassapa about his experience.

Okay. Thank you very much.

CHAPTER 20

The Middle Way

Patrick Kearney · 1h03

> *In this opening talk from a series on the Buddha's first three teachings, Patrick Kearney presents a fresh interpretation of the Dhammacakkappavattana Sutta (SN 56.11) and the middle way. Drawing on the Buddha's personal journey from extreme asceticism to awakening, Kearney explores how the middle way emerged not as mere moderation, but as a dynamic balance beyond all fixed positions and extremes.*
>
> *The talk weaves together the Buddha's story with philosophical insight, examining his failed attempt to communicate awakening to Upaka, his eventual success with the five ascetics at Isipatana, and the crucial realization about different types of pleasure. Kearney explains how the Buddha discovered that both sensual indulgence and severe asceticism are driven by the same underlying taṇhā (thirst) and obsession, just pointing in opposite directions.*
>
> *The middle way is revealed not as the opposite of extremes, but as their complete absence - a dynamic balance found only in present-moment awareness. Using the Noble Eightfold Path as example, Kearney illustrates how this middle way requires constant adjustment among interconnected factors, with no fixed ground to stand on. This accessible yet profound exploration offers both newcomers and experienced practitioners fresh insight into this foundational Buddhist teaching.*

We've been exploring sati and satipaṭṭhāna—mindfulness and the applications of mindfulness—in considerable detail over the previous days. Having exhausted that topic, we're going to move on and do something different.

We're going to go back to the beginning. We'll do a series of talks on the invention of Buddhism—how it all came about—and we'll do this by looking in particular at the first three teachings of the Buddha: Dhammacakkappavattana Sutta, setting in motion the wheel of the dharma; Anattalakkhana, the not-self characteristic; and Āditta, burning. And we'll weave the Buddha's story into that.

So this will be partly esoteric Buddhist philosophy and partly bedtime story. The bedtime story you can regard as historical fiction, because I'm creating a character—the Buddha—and of course we have absolutely no idea about really what happened. We have the ancient texts that tell us a particular story, but there are different ways to interpret it. Usually it's interpreted with maximum reverence. I'm going to provide a

reading which has less reverence and which may or may not be more useful. Just keep in mind that this is my own reading and I'm not necessarily saying that it's the truth. Actually, the first time I gave these talks in Malaysia, apparently they created a bit of a stir among the faithful. And one of the meditators in the interviews was talking about this and she said, "But we know you don't really mean it." Well, what a relief.

The Buddha attained awakening on the full moon of Vesākha, which roughly corresponds to May. This, of course, is the lunar calendar, so it doesn't quite fit our solar calendar. And the first teaching was delivered two months later on the full moon of Āsāḷha in July. This was Dhammacakkappavattana Sutta, Turning the Dharma Wheel—or more accurately, setting the dharma wheel in motion, beginning to turn the dharma wheel, getting the dharma wheel started. In that discourse he taught the middle way and the four truths. Tonight we're going to have a look at the middle way in particular.

The Buddha wakes up, sitting under the tree, and becomes the Buddha. Until then, he was not the Buddha. Buddha is a title, not a name. It means awakened—someone who has woken up. His name that's given to us in the early teachings is Gotama, and Gotama was his family name. So in the suttas, there's no mention of his first name. Later tradition says it's Siddhattha—Siddhattha, one who has accomplished, or Siddha, one who is successful in his purpose. So one who has accomplished what he set out to accomplish. Now this may or may not have been his name. Maybe it was just given to him by the tradition as a way of historical boosting. But we'll take it as genuine, and we'll just call him Sid. It's kind of more friendly.

But we won't meet Sid first. We'll start with him as the Buddha. He's thirty-five years old. He's just woken up. He's decided to teach, and there's a whole story there.

When the Buddha woke up, he had no notion that he was going to become a great teacher. He just had a problem—dukkha—and he wanted to solve it. And he did. Then he spent six weeks under and around the Bodhi tree in what is now Bodh Gaya, enjoying the bliss of his awakening and basically probably just recovering. I mean, he must have had an enormous case of spiritual vertigo—this blast of awakening. Getting used to it must have been quite something. He had sitting periods that would last a week, just recovering, blissing out and coming back to planet Earth, as it were.

In the course of this period, the thought arose in his mind: maybe I should teach this. And this was quickly followed by another thought, which was: no. Because no one is going to understand this. There is no way I can ever communicate this.

Now fortunately for us, someone was eavesdropping, and this was Brahmā Sahampati, who was and indeed on good authority still is a god up in one of the Brahma realms. He actually was an old mate of Sid before he woke up—and this is a long, long time ago during the teaching of a previous Buddha when he and Sid were both students. So Brahmā Sahampati has been keeping an eye on Sid and he's been tracking this whole thing. He hears this thought and of course he's horrified. Because, I mean, the whole plan is Buddha, teaching, Buddhism. And suddenly it's all about to go belly up.

So Sahampati heads down to earth, appears before the Buddha and pleads with him to change his mind. The argument he gives is profound: "Look, there are just a few people who have only a little dust in their eyes. If you teach them, they will awaken. But if you don't, they will perish. You've got to do it."

So the Buddha says, "Okay, I'll do it. I'll take it on." But notice how, at the very beginning, the way the project is defined: just a few people. Clearly, the Buddha has no notion that he's going to create a world religion. That's not in his thinking. He might find a few people who might just possibly understand what just happened.

So he first thinks of his two previous meditation teachers. He had two meditation teachers when he was still Siddhartha, still a Bodhisattva, but they had both died—one a week before, the other the night before. Because they had accomplished serenity to a very great extent, they were reborn in a very exalted and subtle heaven where they are today. By the time the results of their good karma run out and they get reborn on earth, Buddhism will have been long since finished and they'll just have to wait for the next Buddha and start the whole thing all over again.

Imagine how you would feel if you missed it by one night. How pissed off would you be? But that's karma. The point of the story is, of course, that the opportunity to actually encounter the Dharma and benefit from it is extremely rare. So don't waste it. You don't know how long in one's wanderings in samsara one might go before one gets another opportunity.

So they're off the list, and then the Buddha thinks of his five former companions. We're going to look at them later on, but basically in his spiritual career he had tried first meditation, developing very deep absorption states. Having decided that was a dead end, he then tried ascetic practices, which he did without a teacher, but he attracted five equally fanatical men who were also committed to the practice of asceticism. They were very impressed by what he was doing and they decided to hang around and wait until he got enlightened.

But there was a bit of a kerfuffle, a bit of an argument, and the five companions set off in one direction and Siddhartha headed off in the other, so they hadn't seen each other for some time. The Buddha thinks of them: maybe they might possibly, conceivably, understand.

So he uses his psychic powers and discovers that they're staying at a place called Isipatana, north of Varanasi—or what is sometimes pronounced Benares. So he heads off.

As he's going down the road, he meets someone called Upaka, who is an Ajivaka. The Ajivakas were an early ascetic order. Upaka is coming one way, Buddha is going the other way, and they meet. Upaka is really impressed by this guy. The Buddha apparently was, by all reports, extremely good looking. Plus he is radiating the glow of his awakening.

So Upaka, very impressed, says, "Friend, your faculties are clear, your complexion is pure and bright. Under whom have you gone forth? Who is your teacher? Whose dharma do you follow?"

So Upaka is clearly impressed. This guy has obviously realized something. So where does he belong? Where does he fit? Who is his teacher? What tradition does he belong to?

Now this is the first opportunity that the Buddha has to actually teach Dharma. He's spoken to people before now, but he has not spoken of his realization. He's spoken more in terms of faith, saddha, the heart connection. Here's someone who might possibly get it, and he actually wants to know. So the Buddha decides to just give him the full blast, and he bursts into spontaneous verse.

The Buddha says, "I am the one who has overcome everything, who understands everything, unstained among all phenomena, abandoning everything, freed by the exhausting of craving, having understood directly by myself—to whom should I point? For me there is no teacher, and one like me is unknown. In the world, with all its devas, there is no one equal to me. I am the Worthy One of the world. I am the supreme teacher."

Alone I am Sammasambuddha. I am cooled, extinguished. To set turning the wheel of Dharma, I am going to the city of Kasi. In a world gone blind, I go to beat the drum of the deathless.

So that's what he says. And clearly this is not a man with any sense of lack of self-worth. It's a complete confidence and just, as I said, full blast. This is what's called in the tradition a declaration of truth. It's just—okay, he wants to know, I'll hammer him with what's actually going on.

Upaka points out that this is a claim to enlightenment. And the Buddha says, that's correct. I think you understand what's going on. And Upaka shakes his head and says, which could be roughly translated in contemporary English as, "Yeah, whatever." And he leaves. It's more like, "Yeah, friend, maybe. Yeah, possibly. So you say. That's nice. I hope you enjoy it. Bye." And he continues on his journey, completely unimpressed. Totally not impressed.

So as he leaves, perhaps the Buddha was thinking to himself, "Well, that went well. Not." And it brings out the problem that he's got. The reason why he didn't want to teach in the first place is because it's impossible to communicate this. How is he going to do it? When he's marching off down the road, he has no idea how he's going to do it. It's not that he's got a plan. All he's got is possible contenders, possible students. He tries out Upaka because he thinks, "Okay, this guy's interested." And he says basically the first thing that comes to his mind, and it's a complete bust. So all he knows is that that's not going to work. So at least he's eliminated one wrong track. And off he goes, and he must be wondering, "So how am I going to do this? How many false starts can I go through before I realize I was right the first time? And it can't be taught."

Anyway, he continues his journey. He arrives at Isipatana. And the five companions don't want to listen. They see him coming and they kind of nudge each other and say, "There's Sid, bastard." And they say, "Just ignore him. He will go away." But he's coming straight for them.

And the thing is, he's radiating this awakening and they just cannot, despite themselves, they cannot ignore it. So they kind of grumpily stand aside and they prepare a seat, which probably just means a cloth thrown on the ground. "Okay, you can sit down."

So they're sitting down and there's this uneasy silence because they're wondering what the hell is he doing here. And he explains that what he's doing here is that he's enlightened. He says, "I'm the Buddha. I did it. You were hanging around waiting for me to do it. Well, I've done it."

And they are even less impressed than Upaka. And they just completely dismiss the whole thing. "We're not interested. Basically, go away." And so he tells them again, "Yes, I've done it."

I'm awakened. And I can teach you. And they're just not interested. Go away.

Now this is getting into dangerous territory because remember we talked about the significance of the number three. If you ask a question three times, it means you're serious, so the person has to respond. But equally, if you're offering a teaching and it's refused three times, that means it's serious—the teaching is rejected, go away.

Now he's come all this way because he thinks these five have the potential to awaken. And they will not listen to him. They've already knocked him back twice. He's got one more shot just to get them to listen. There's no guarantee that they're going to accept what he says, but even to get them to listen—one more shot. So everything is hanging by a thread.

Finally, he says to them, "Have you ever known me to speak like this before? Have I ever claimed any enlightenment whatsoever before?" And this gets them looking at each other and thinking, and they remember. They realize, well in fact he never has. They were very impressed by him back in the day and they thought, oh maybe he's enlightened, but he quickly hit that idea on the head. And they wanted to be students, but he hit that on the head too. "I'm not enlightened, I'm not a teacher. I'm just here doing my ascetic practices. Please don't take up that bit of nails. It's mine. Get out of my way." And they said, "Well, can we at least hang around? We'll do our own practices in your vicinity. Is that all right?" "Yeah, okay, you can do that."

So he's never made any claim like this before. And he's reminding them: have I ever done this before? And they say, well, no, you never have. And he says, "Well, I'm making it now." And this stops them. And they look at each other and they decide, well, we've known Sid for a while. We don't like him, which is why we left. But we know that he's not a liar. If he says something is so, then he believes that it is so. If he says he's enlightened, then he certainly believes that he's enlightened. Something must have happened.

So they say, "Okay, we'll listen to you." So the stage is set. The Buddha can start teaching.

It's interesting that again, the Buddha begins with a declaration of truth: I've done it. I'm awakened. The first time it didn't work. The second time it almost didn't work. But finally it does work.

And if we ask what's the difference between the two occasions, the difference is the social context. On the second occasion he was talking to people who knew him. Upaka didn't know him. He could have been looking like he's enlightened, but actually a refugee from the loony bin down the road. Well, they probably didn't have loony bins,

but this was the Gaya area. And Gaya at the time, and today, was notorious for being a highly charged, psychically highly charged area full of ghosts and spirits. And so he may well have been possessed. It's quite possible.

But the five companions—they know him. And so the declaration of truth has more power depending on the social context. When people know you and trust you, they're prepared to take what you say to be true.

So the first discourse begins, and the version which is handed down—again, the suttas are kind of executive summaries.

They're designed to be put into the memory banks and chanted. So they're not actually word for word what was said. They're a kind of summary of the key points.

And this is how the discourse begins:

"This is how I heard it. Once the Blessed One was living at Benares in the deer park at Isipatana. There he addressed the group of five bhikkhus."

Now you can see that this is artificially forced into a template from the very beginning, because in fact there were no bhikkhus. These were ascetics—they hadn't been ordained, they were not bhikkhus. But they're called bhikkhus because that's the standard form, even though this is before the Sangha existed.

The Buddha says: "These two extremes should not be followed by one who has gone out into homelessness. What two? The pursuit of sensual happiness among sensual pleasures, which is inferior, normal, the way of ordinary people, lacking in refinement and useless, and the practice of self-exhaustion, which is painful, lacking in refinement and useless. Avoiding both these extremes, the Tathagata has awakened to the middle way that gives rise to seeing and understanding and leads to calming, direct knowledge, full awakening, nibbana. And what is the middle way that gives rise to seeing and understanding and leads to calming, direct knowledge, full awakening, nibbana? This eightfold path of the noble ones, the cultivated ones: right view, right aspiration, right speech, right action, right livelihood, right energy, right mindfulness and right concentration. This is the middle way."

Notice what this is—it's a strategy. How is the Buddha going to present his awakening? He tried the full blast and that didn't work. So now he's coming at it indirectly, and he begins by introducing this notion of the middle way.

In the discourses there are different presentations of the middle way. The most common way is the middle way between existence and non-existence, between being and non-being, and between eternalism and annihilationism, sassatavada and ucchedavada. Here, it's taught as the middle way between the extremes of sensual happiness and the practice of self-exhaustion. This presentation of the middle way is actually, as far as I know, unique to this particular discourse. In every other discourse, it's presented differently—basically between existence, non-existence, eternalism, annihilationism. This presentation is unique.

In other words, the middle way is a general principle and it can be applied to different circumstances where it has a different appearance. Context is everything. The Buddha needs to get through to this particular group of people. It's no good giving them some general universally true principle if it just goes right over their heads. He's got to figure out a way to get through their defenses to get them to really open up to what he wants to tell them. Because there are defenses against hearing the Dharma. We all have layers of armor to prevent us from actually hearing the Dharma.

The Buddha may have reflected on the difficulty of communicating Dharma from his experience when he was a young man still at home and he had his first realization. It's been summarized as he suddenly saw immediately and directly aging, sickness and death and the universality of them. Plus in the stories he also saw a samana, someone who was practicing to overcome this pain.

At this time Siddhartha was a young man living a privileged life as an upper class lad in the Shakya Republic. We don't know how old he was. If the tradition is correct, he would have been probably mid-twenties. But I think this is more like something which would have happened to a teenager, personally. But basically, he suddenly realized that he's going to get old, get sick and die. And it's not just him, it's everyone. For some reason or other, one day he was open, he was vulnerable. Bang! It hits him, and he is profoundly shocked.

All his normal layers of defenses against understanding this for some mysterious reason dropped away and he just got hit with it. Now all of us have layers of defenses against this understanding because that's what enables us to live normally within the world. Otherwise we'd go crazy. To drop our armor could expose us to a reality that could send us mad. And it could have sent Siddhartha mad. Instead it catapulted him out of home, off onto the quest for enlightenment.

Not only is this realization profound and moving—which of course the companions know, his audience knows this—but what characterizes this is a complete inability to actually communicate it to anybody else. So he comes back home, sweating, shaking, in a state of shock. His parents say, "What happened, what's the matter?" And he says, "We're all going to die."

At first his father is worried. His father is president for life of the Shakya Republic.

He's already reaching for his sword and he says, "Which way did you see the army coming?"

And Sid says, "No, no, no, no, no, there's no invasion. I'm just saying, we're all going to die."

His father looks at him oddly, his attitude: "And?" Like, duh.

"No, you don't understand," Sid insists. "We're all going to get old, and we're all going to get sick, and then we're all going to die."

His parents look at each other and say, "Yeah, maybe you should wash up before dinner."

"No, you don't understand."

So he's seen something that, in a sense, everybody knows. Everyone has come to terms with it in their own way. But his understanding is so deep and so fresh, he cannot come to terms with it. From his parents' point of view, basically the kid's gone crazy. "Calm down. Cool it. You'll recover. Take a holiday for a while. Life isn't so bad."

But of course he can't hear any of this. And they can't hear what he's saying.

To have some kind of penetrating understanding is to put you in a very isolated position. Where can you go for anybody to actually get what you're talking about? He had to leave home. There was no one who could understand.

So he knows from his own experience, when he's faced with these five companions, how deep the layers of defenses go. He's got to find a way first of all to open up those defenses, expose the problem, and show the way out. That's his challenge.

To return to his audience—these are practitioners of the path of severe asceticism. What they were doing is very close to following Jain principles, and this tradition was quite strong in the Gaya area. When Sid left home, he was up in Nepal and would have gotten onto the main highway heading southeast. He would have crossed into what is now northern Bihar, where he practiced meditation—apparently an area very strong in

yoga practice. Dissatisfied with the results of meditation practices, he kept traveling south of the Ganga and ended up in the Gaya area, where shamanic powers were very strong, hauntings and spirits were very common—a very dangerous area where the most fanatical ascetics would come. This is where he started this practice, and where he meets these other ascetics.

Now, what everybody wants is sukha—pleasure, happiness, bliss, peace. This is what all practitioners are heading for. But how to get it?

The ascetics believe that the way to sukha is through dukkha. You face your pain directly and go straight through it to the other side. When you get there—bang—sukha, awakening, enlightenment. If you've trained in classical Mahasi, this is a tradition you're all very familiar with. If you say, "My body hurts intensely when I sit," you'd be told, "Just note it until it goes away. Endure. Sit through pain." You get the same flavors of practice. It's not just the specific ascetic tradition—this kind of attitude can permeate many different traditions.

The Buddha understands these five companions because he shared the same beliefs, practices, attitudes. Siddhartha believed that what holds us back from awakening is our attachment to pleasure. We're so attached to pleasure, to having a good time, that we can't unstick ourselves in order to proceed to awakening. So pleasure was the enemy.

What changed for him—and now we're backtracking to when he was an ascetic—he practiced this way of asceticism, and being a completely fanatical, macho young man, he practiced it close to the point of dying. One of the practices he specialized in was self-starvation. Many years later, he explained to his students that he was so skinny he could poke his finger into his belly and feel his backbone. This Sid was just totally macho, fanatical, a bulldozer kind of fellow. What he was bulldozing through was his attachment to pleasure.

But he came to realize that this asceticism wasn't the way.

He was closer to death and still no closer to awakening. And so he came to a crisis.

Later on he describes his practice, the kind of meditation he did at this point. Years later, he's explaining to his students what he was doing as an ascetic:

"I thought, suppose, with my teeth clenched and my tongue pressed against the roof of my mouth, I beat down, constrain and crush mind with mind. So, with my teeth clenched and my tongue pressed against the roof of my mouth, I beat down, constrained and crushed mind with mind. While I did so, sweat ran from my armpits."

It's pretty impressive. Think about it. If you're sitting there and sweat is not running from your armpits, are you really making enough effort? And is there a tightness in your jaw?

"Just as a strong man might seize a weaker man by the head or shoulders and beat him down, constrain and crush him, so too with my teeth clenched and my tongue pressed against the roof of my mouth I beat down, constrained and crushed mind with mind and sweat ran from my armpits. But although tireless energy was aroused in me and unforgotten mindfulness was established, my body was overwrought and agitated because I was exhausted by the painful striving."

So that's the practice he tried that did not work. He had tireless energy and unforgotten mindfulness. Sounds pretty good to me. But there was an immense strain in all of this. "My body was overwrought and agitated because I was exhausted by the painful striving." Notice the role of the body in all of this.

So then he reflects: "Whatever painful, wracking, piercing feelings due to exertion samanas or brahmanas have experienced in the past, this is the utmost. There is none beyond this. And whatever painful, wracking, piercing feelings due to exertion samanas or brahmanas will experience in the future, this is the utmost. There is none beyond this. And whatever painful, wracking, piercing feelings due to exertion samanas or brahmanas experience in the present, this is the utmost. There is none beyond this."

Whatever is humanly possible to do in terms of making heroic effort and just driving yourself, bulldozing your way to enlightenment—whatever anybody could have done in the past, whatever anybody could do in the future, what anybody is doing in the present—I've done it. It's like he's won the race, but no one's applauded him because it's completely useless. It's not working. All it's doing is killing you.

And he concludes: "But I have not attained any states surpassing the human by this racking practice of austerities, any distinction in understanding and seeing worthy of cultivated ones." It's been a complete failure.

Now this is a man who walked out of a marriage, walked out from his family, including his newborn son, walked out from his career as a leader of his people. As I said, he had two teachers that we know about, meditation teachers: Alara Kalama and Uddaka Ramaputta. With both teachers, he was a naturally gifted meditator. He mastered their meditation system. He's very bright. He learned the theoretical dharma that they taught. In both cases, he graduated. His first teacher says, "You've done it. Whatever I know, you know. The dharma needs teachers. There are people in this assembly. We can use your help. Could you teach?"

And Siddhartha looks at him with a glance of withering contempt and says, "And this is all there is to it? I'm out of here." And he walks off.

So he hasn't just abandoned his family, he's abandoned his dharma community. Goes to another teacher, the same thing happens, walks out on them. This is a serial walker-outer. He gets to the point where he's doing the austerities and he's completely alone. I mean, he's alienated everybody by this point, just this fanatic determination not to compromise until he's satisfied, regardless of the cost anybody else is paying for his lifestyle. And at the end it doesn't work, because basically he's wasted his life and it looks like he's going to die soon. And so the thought arises: could there be another way to awakening?

He's desperately trying to think of something. And suddenly, up pops a spontaneous memory from his childhood:

"I remember that when my father, the Shakyan, was working, while I was sitting in the cool shade of a rose apple tree, withdrawn from sensual pleasures and unwholesome states, I attained and lived in the first jhāna, which is accompanied by applied and sustained thought, with rapture and pleasure born of seclusion."

"Could this be the way to awakening?" Then, following on that memory came the awareness: "This is the way to awakening."

So he has a spontaneous memory of an equally spontaneous experience that happened in childhood. This story gets increasingly elaborated over the centuries, but this is the earliest version. It's very simple. He's young—we don't know how old. It's hot. He's sitting under the cool shade of a rose apple tree, watching his father work in the hot sun.

Now, I don't know about you, but sitting in the cool shade, preferably with a nice drink, watching other people work in the hot sun—this sort of thing gives me great pleasure and makes me feel particularly relaxed. So there he is, sitting, relaxed, not a care in the world, and he just slides into this spontaneous concentration state, which is characterized by pleasure.

And so he asks himself the thought: "Why am I afraid of pleasure?" I find this question fascinating. He's at a complete dead end. He's desperate to find out: what have I done wrong? And what he zeroes in on is the question: why am I afraid of pleasure? The full statement is: why am I afraid of pleasure that is unconnected to sensual stimulation and unwholesome states?

What he's talking about is non-addictive pleasure. The basic principle that he's been following at this point is: we're all stuck on pleasure, so we've got to get away from this. What he recognizes here is that there are different kinds of pleasure. There's what in the suttas is called sensual pleasure, and this is essentially pleasure that comes from and is dependent upon a sense stimulus. I get a certain stimulus—ooh, that feels good. And that pleasure is temporary. It arises only because of the stimulus. When the stimulus fades, the pleasure fades. And if I want more, I've got to renew the stimulus. In other words, it's what we would call addictive pleasure—pleasure which is based on a relationship of addictive return to the source of the pleasure.

In a broader sense, it's the pleasure of consumerism, what we're familiar with as consumerism. I shouldn't tell you this because this would disturb your meditations, but while you've been cloistered here, there's been some very significant news on a global scale: Apple have released a new iPhone! And it's got really interesting little gadgety things that the old iPhones don't have anymore. All over the planet, people are lining up, desperate, camping out. They've got to get these new iPhones. I mean, how can you live without another iPhone, the new one? And the old iPhone? I mean, bleh. How could I have thought that this is great? It's terrible. I've got to get another one.

This is the kind of pleasure that in the suttas is called sensual pleasure. Now that kind of pleasure—the pleasure often called the pleasure of the household life—is sticky. And at this point, Siddhartha realizes: okay, that's right, but what I need is pleasure, but I need a different kind of pleasure, a pleasure which is not sticky, which is not addictive.

And remember how he came across this—there was a memory from childhood. In other words, a pleasure that has a childlike quality of spontaneity to it. A pleasure that comes from a time when we are willing to accept whatever the world offers before disillusionment. So a pleasure in which not only is that grasping, addictive grasping unnecessary, but it's not even yet conceived of.

So he discovers the spontaneous pleasure that characterizes childhood—when it's a happy childhood, presumably. And his project becomes: how can I return to this pleasure today as an adult? I already had it when I was a child, but somewhere I lost it, and I didn't even notice that I lost it. Now I realize I've got to find it because this is the way I can unstick myself. This is the way to awaken.

And so, hence the displeasure of the companions, because the companions are having a normal day at the office—flogging themselves, starving themselves, beating themselves up. And they notice that Sid has disappeared. He's not in his usual part of the forest.

And then they see him walking towards them—there's a little smile on his face they haven't seen before, and he's also rubbing his stomach in a very contented way. They ask what happened, what changed, and he says, "I just had this fantastic lunch that was really good, and I think I'll have a nap now."

They're just horrified. Who does this guy think he is? A complete backslider, a total betrayer, a backstabber. They're so disgusted that they march off. Or alternatively, maybe he marched off from them. "What a bunch of killjoys. Why should I waste my time with them?"

In any event, that's when they split. Siddhartha goes off to generate pleasure. The principle that he discovers is that the path itself must be pleasurable. The path to sukha has to be sukha—pleasure in the sense of what we might call contentment.

When we're contented, we don't have any felt need to look further than what is happening now. We're not anxiously thinking about the future. We're no longer concerned with any result that may arise in the future. You might have had a sitting that's going quite well, but underlying it is this sense of anxiety and agitation: "Oh, this is going well so that then I can get what I want. I hope this keeps going for the rest of the retreat."

This mind state comes from a sense of anxiety and insecurity—I want something in the future. This pleasure now is useful to me insofar as it will get something for me in the future. That's not contentment.

In a state of contentment, I'm not even thinking of the result. It doesn't occur to me to think of a future result. What I've got is fine. Thank you very much.

When Siddhartha was practicing asceticism, he was crushing mind with mind. With that kind of practice, he must have been looking for a result. He must have been looking for what would happen next that would justify this effort he was making now.

But here he begins looking for a relationship to the practice in which nothing more needs to be grasped—in which the attention is so completely absorbed in what's happening in the present that any sense of a future result can be completely forgotten. A quality of absorption where there's no need to look to an imagined future to get something that's missing now.

This is where he's coming from when he teaches the middle way.

Is it possible that his sojourn with the two teachers of absorption could have been after his ascetic period?

Not according to the tradition. Just a curiosity.

I don't know where it... I've always read that he left home at the age of 29 and was awakened at 35. But I haven't seen that in the suttas. I can't recall a sutta where it actually gives his age. The problem we have is there's the legend in layers, and we get the completed legend and it's hard to sort out the earliest.

In the suttas it only talks about the ascetic period and the period with the teachers. It actually doesn't give any order to them. I think it's the order in which they're spoken of, but I have to check that. It would be interesting to see. I know the tradition puts them... Yeah, the tradition puts them that way.

But considering Hugh's question, you know, he comes out of the ascetic period thinking, "Well, maybe that pleasure of absorption is a useful path to follow." It would follow that he would then go and train in that. Yeah, could be. I have to look it up—that's an interesting point.

Now, so this is where his practice turned around and then it ended up with awakening. Now he's talking to the ascetics and he knows exactly where they're coming from because he was there. There's a sense in which he knows how tough his first audience is, because in a sense he's talking to his pre-enlightened self. "I was exactly like that." And he knows, he can remember what a tough nut he was to crack. How he wouldn't listen to anyone. So how can he get through to them?

And where he goes is this whole business about the relationship to pleasure and pain.

Most people think the way to happiness is through what we call consumerism. The vast majority of people believe that firmly. The ascetics belong to a tiny little minority who have decided that is a complete crock, that it's complete rubbish, it doesn't work, it's never going to work, we have to do something different. And so they practice asceticism. Now to do that you have to be particularly stubborn and fanatical, just even to begin to do this, much less to stick with it. So this is a hard audience to crack.

And the logic of the ascetics is that: "I pursued this path heading in this direction, which is the path of grabbing pleasure. It doesn't work. So the path this way is the wrong path in the wrong direction. What would be the path in the right direction? Where should I go?" Thinks. "Ah, got it, that way. The opposite way. If this way is the wrong way, then the opposite way must be the right way."

And that's the essential logic behind it. What the practitioners miss, what the Buddha has realized, is that the opposite way is also the wrong way, precisely because it's the opposite. That is what makes it the wrong way.

And he expresses this in terms of the anta, the extremes. An anta is a point beyond which you cannot go further. So the peak of a mountain is an anta. You can go that far, you can't go any further. So you can push in one direction, go as far as you can in the pursuit of pleasure—doesn't work. But if you then head with the same determination in the opposite direction, you just hit another anta. It doesn't work.

What characterizes the pursuit of pleasure in the ordinary consumerist addictive sense is obsession, drivenness, or what the Buddha came to call tanhā, literally thirst. The ascetics can see that and they've renounced it. What they haven't noticed is that what drives their practice is obsession, drivenness, tanhā. They think they're not in the same boat as all these tacky laypeople. They're in exactly the same boat. They're just heading in the opposite direction. But they are equally as driven as the laypeople.

The laypeople are stuck on pleasure, but they are stuck on pain. The point is not the pleasure or the pain. The point is the stuckness. That's what causes the problem.

And so the pleasure that the Buddha is talking about, real pleasure, the pleasure that he stumbled into under the rose apple tree is the pleasure that comes from the absence of drivenness. It's when drivenness, obsession, drops away that real pleasure emerges.

The Buddha is pointing out to them, you think you're heading in the right direction because it's the opposite way of the wrong direction, but you're wrong because it's the opposite. And it is equally driven. It's the drivenness which is the problem. And this is the middle way.

The middle way cannot be defined as the opposite of another way. Because that would just be another extreme. Sometimes you see the middle way, often you see the middle way presented as the middle way of moderation. So don't be extreme. Try the middle way. And if you think about that, what is it really saying? It's saying, OK, here is one extreme. Here's another extreme. Get out a ruler, measure it precisely. Dead in the middle, there's the middle way. But what's that? That's the opposite of the two ends. It's just another extreme.

The middle way can only be found where there are no extremes. In other words, where we are not stuck on anything at all.

So the middle way is a dynamic balance between opposites. It's characterized by no fixed position. As soon as we land somewhere and say, this is it, this is it, then that, its opposite, is not it, and we're in the extremes. As soon as we land anywhere and hold on, we're caught up in extremes.

The middle way can only be found where there is no fixed position and this dynamic balance can only be found in the present. Because any notion of past and future involves grasping and it involves opposite extremes. I'm doing this for that. I'm caught up in the extremes again.

And the Buddha then gives the example of the middle way as the eightfold path and you notice that this illustrates this basic principle. So you have the eightfold path. It's one thing, except it's not a thing, it's a complex system made up of eight parts. Right view, right aspiration, right action, right speech, right livelihood, right energy, right mindfulness and right concentration.

So you have eight factors, each of which has to be balanced with the other. But to make it more complicated, it's divided into three subsystems. The wisdom group, the ethics group, and the meditation group.

So the wisdom group consists of right view, right aspiration. Both of these have to balance each other. Then you get the ethics group: right action, speech and livelihood. Each one of these has to balance each other. Then you get the meditation group: right effort or energy, mindfulness, concentration. These have to balance each other.

Each one of these in each group has to balance each other so that this particular group is balanced. Each one of the groups has to balance with each other. And every one of the eight factors has to be balanced with every other of the factors. If I was mathematically inclined I could work out how many possible relationships that would add up to. I've never attempted it because my mathematics is pathetic but I'm pretty sure it would be a large number.

So it's this enormously complex network of relationships all of which are dynamic. Because every aspect is influenced by the state of every other aspect, which is true of all of them, and they're all moving. So there is no place to stand still.

There is no ground upon which to fix a position. And this is the middle way.

You've noticed this in your own practice. Have you ever had the thought, after much struggle: "I've figured it out. This is it. This is what I do. It works perfectly"? Have you ever come to that position where you've thought, "Okay, that's it. It's been a while, but now I've got it down. All I've got to do is just do this"?

If you've had that experience, you know how disappointed you are the next time you apply this principle—because it doesn't work, because the whole thing has already changed. In other words, you've landed smack in the middle of an anta, of an extreme. And the first thing we have to do is unstick ourselves from that and re-enter the middle way, which is just dancing all the time. And there's nowhere that we can pin it down.

This is why, after forty years of meditation, you think to yourself, "I think I'm beginning to get the hang of it." Actually, I was talking recently to an old mate of mine, a long-time meditator, and he says, "Look, with meditation practice, you practice hard for twenty-five years, and then you begin to understand what you're doing." But you only begin to understand. It's an inherently dynamic and complex process.

This is what the Buddha was trying to communicate to the five ascetics. Basically, he was trying to unstick them from their fixed views about what was right and what was wrong and what you should do and what you shouldn't do. First, you have to open them up to recognize that they've been on the wrong path all this time—that's the bad news. The good news: they can do something about it. And they can do something about it now, because the only time that we can do something about it is now.

And so the five companions get it and suddenly they're open, and the Buddha can begin to convey what he's talking about. But we'll explore that tomorrow night, because I think we've gone for a long time already.

Thank you very much. Thank you for listening.

CHAPTER 21

The Four Truths

Patrick Kearney · 1h16

> *In this dharma talk from a month-long retreat, Patrick Kearney provides an in-depth exploration of the Cattāri Ariyasaccāni (Four Noble Truths) as presented in the Dhammacakkappavattana Sutta (SN 56.11). He begins by examining the translation and meaning of "ariya" - suggesting "truths of the noble one" rather than simply "noble truths" - and explores how these represent the awakened perspective on reality.*
>
> *Kearney offers a detailed analysis of dukkha, explaining it as "painful emptiness" at our core rather than simply "suffering." He describes three levels: dukkha-dukkha (ordinary physical and emotional pain), vipariṇāma-dukkha (the pain inherent in impermanence and lack of control), and saṅkhāra-dukkha (constructed dukkha, including the five upādānakkhandhā or clinging aggregates). The teaching emphasizes that dukkha becomes more refined and subtle as practice deepens.*
>
> *The discussion then turns to tanhā (craving/thirst) as the cause of dukkha - not mere desire, but driven desire characterized by obsession (rāga) and delight (nandi) that leads to further becoming. Kearney explores the cessation of dukkha through the complete abandoning of craving, and concludes with the Eightfold Path as the way to this cessation. The talk includes the inspiring story of Koṇḍañña, the first to attain stream-entry upon hearing this teaching, illustrating the power of patient practice and faith.*

Last night we were looking at the middle way, opening the satchel of Dhammacakkha Pravartana Sutta—setting in motion the wheel of the Dharma. We explored the back story: how Siddhartha became the Buddha, and how he decided that he had to teach. He went looking for his five former companions, tracked them down, and first used the teaching of the middle way as a strategy to break open their resistance to hearing the Dharma—essentially breaking open their resistance to hearing something new. They assumed they already knew, but they were wrong, so he had to work his way through this resistance first, before he could then give them the basic teaching.

After accomplishing this, what he teaches them are the four truths. These are the *chattāro ariya-saccāni*, usually translated as the noble truths. Recent scholarship has cast doubt on that translation, so now you get different variations: "the four ennobling truths," or "the truths that have the function of making one an ārya." What I prefer is "the truths of the ārya."

An ārya is a mature student, someone who has had at least one glimpse of the unconstructed. You could say the bottom of the bucket has fallen out at least once. Such a person is ārya—cultivated, refined, noble. The word is actually cognate with aristocrat, aristocracy. So they form a kind of spiritual elite. In one sense you could say these are the Buddha's people, the ones who actually have some understanding of what he's about, regardless of nationality, gender, language, or ethnicity—all of that is irrelevant.

The four truths are what is true to such a person. What is true to most people is something quite different, but what is true to the mature practitioner is this basic framework. When the Buddha is speaking, of course, there's only one noble person, one ārya, and that's him. So these are his four truths.

Let me go through them.

This is the noble one's truth of dukkha. Birth is dukkha, aging is dukkha, sickness is dukkha, death is dukkha. Sorrow, lamentation, pain, grief and despair are dukkha. Association with the unloved is dukkha. Separation from the loved is dukkha. Not getting what one wants is dukkha. In brief, the five bundles associated with clinging are dukkha.

This is the noble one's truth of the arising of dukkha. It is craving, which leads to further becoming, is bound up with obsession and delight, and finds its delight now here, now there—specifically craving for sense pleasures, craving for existence, and craving for non-existence.

This is the noble one's truth of the cessation of dukkha. It is the complete cessation of that very craving: abandoning it, renouncing it, releasing it, letting it go.

This is the noble one's truth of the way leading to the cessation of dukkha—the noble eightfold path of right view, right aspiration, right speech, right action, right livelihood, right energy, right mindfulness, and right concentration.

These are the four truths. They are the truths of the awakened ones, the noble ones. In other words, they show us the world from the perspective of someone who has awakened or is on the path to awakening. They provide the basic framework of the Buddha's teaching—more than a list, a kind of template, a structure being provided here.

The whole thing revolves around this concept of dukkha, so we have to examine it. This is a key technical term. Previously it was always translated as "suffering," but there's been some dissatisfaction with that translation, so people have tried other approaches.

Unsatisfactoriness. That's pretty wimpy. What about Thanissaro's "stress"? I don't think that works at all. The problem is that with many of these technical terms, there is no English equivalent. So every translation is wrong. I think it's better to simply say dukkha and get over it.

It's a compound word that comes from *ka*, which means space or empty space, and the prefix *du*, which conveys a sense of bad, unpleasant, painful, undesirable, imperfect—don't want it, get rid of it. So dukkha is a painful space. It refers to the painful emptiness that we feel at the center of our being, this sense that there's something missing. We feel we have to do something because there's something missing with the way things are—with who we am, with what our situation is. It's okay, but it could be better, and we need to make it better. This is the painful emptiness we feel at the center of our being.

Ka also refers to the space at the center of a wheel. The wheel, of course, is often the basic symbol of Buddhism, and there's always an empty space at the center—that's *ka*. The image here is of a wheeled vehicle where the axle goes through the empty space at the center of the wheel, but it doesn't fit properly. So the vehicle, if it moves at all, moves only slowly, grindingly, with incredible resistance. Grind, grind, grind. Has your practice ever felt like that? Has your life ever felt like that? This is dukkha.

Its meaning extends from the most gross forms of suffering and misery all the way through to the most subtle forms of discontent. Sometimes I try a little dukkha thought experiment. Think about your situation sitting here right now—is there anything about this situation that you would change if you could? If the answer is yes, then you have dukkha. You don't necessarily have suffering, but you certainly have dukkha. So dukkha can be quite subtle or extremely gross. It covers that entire range.

The Buddha begins with dukkha and analyzes it into three levels. But first, why does the Buddha begin with dukkha? Because he's talking to practitioners about their practice. Remember the context—he's got five companions who are extremely dedicated practitioners. The problem they have, from the Buddha's perspective, is that they've got the wrong practice, heading in the wrong direction, leading to the wrong result.

Why begin with dukkha? Because any kind of practice begins with dukkha. Why are we sitting in this hall? Because we have dukkha, we know we have dukkha, and we need to do something about it. That's why we're here. If we really didn't have dukkha, we would not be here. We would be at home or in the pub or at a party or doing something sensible—reading a book, maybe. But we're here because we've been moved to do something.

This takes us to the whole realm of affect, of feeling. There's some kind of pain, and we are moved to do something about it. This is the foundation of any meditation practice. The Buddha is addressing practitioners about their practice, so this is the beginning of it.

Notice also that in this framework of the Four Truths, there is no mention of *avijja*—ignorance or delusion.

Now if you're familiar with Mahayana Buddhism, this would quite possibly come as a surprise. My main exposure to Mahayana is through Zen, and in Zen they're always emphasizing ignorance or delusion. This is the fundamental problem—we don't see what's going on. So what we have to do is see properly what's happening. This is the fundamental issue, and enlightenment is the overcoming of delusion.

But here there's not a single mention of delusion. What the Buddha talks about is tanhā, classically translated as craving—literally it means thirst. Delusion is a cognitive term; it's about the head, about what we understand. Tanhā is an affective term; it's about the heart, about drivenness, about what we love and what we hate. Both are covered by tanhā, by craving.

And again, this practice is about action—about what one does. The source of action is the heart, driven to do something. So again, tanhā. You can see that the Four Noble Truths provide this universal framework, but it's specifically directed at these five people, at their particular context.

The Buddha then analyzes dukkha into three levels. He says birth is dukkha, aging is dukkha, sickness is dukkha, death is dukkha, sorrow, lamentation, pain, grief and despair are dukkha. This is the normal everyday physical and emotional pain—the dukkha that arises through ordinary suffering. The tradition calls it dukkha-dukkha.

Then he says association with the unloved is dukkha, separation from the loved is dukkha, not getting what one wants is dukkha. So this is a deeper level. The tradition calls it vipariṇāma-dukkha—the dukkha inherent in change. This is the pain in a life that is fundamentally out of control, and it points to impermanence, which is a major theme for the Buddha. Things change.

Now that's not necessarily a problem. But the problem is that things change regardless of what we want them to be. I want things to change. For example, I want to get thinner rather than fatter. But it doesn't seem to be happening that way—I seem to be getting fatter rather than thinner. The situation seems to be out of my control. I suppose

I could be relentless about it, but... that's another thing about change. I would like to be much more disciplined. I would like to change in that way. But I don't seem to be changing in that way. If anything, I'm getting lazier as I get older.

So it's not simply that things are changing. Things are changing in a way that I do not control. Change takes me to places that I don't want to go. It takes me to places where I'm separated from what I love and associated with what I don't love or in fact dislike. And there's not much I can do about it. And of course not getting what one wants is dukkha. Has anybody actually had that experience?

He's going deeper with this. One way of looking at the nature of dukkha is to say it's the gap between what is happening and what we want to be happening. And often when we look, there is that gap. It can get very subtle.

One of the things about dukkha that people don't necessarily get is that it can sound very gross, and it can sound very pessimistic. If you're an orthodox Theravadan, the way you show your orthodoxy is by saying, when anybody says anything about anything, you shake your head and say, "Oh, great holiday—ah, that's dukkha."

No, honestly it was fantastic. Dukkha.

So you're demonstrating this way that you have truly absorbed the Buddha's teaching. But dukkha is actually a refined taste that takes time to develop. The ability to perceive the dukkha in a situation requires a high degree of refinement in the senses and in the citta.

You know the old fairy tale about the princess and the pea? The princess visits some castle and the king is a bit suspicious about her identity. Is she really a princess? Is she just pretending to be a princess? So she's sent off to the guest bedroom. It's this magnificently comfortable bed, but the king has a single pea inserted under the mattress. And the next morning, he says to the princess, "So my dear, how did you sleep?" And she says, "It was terrible. That mattress was just awful. I couldn't get to sleep at all." You're a princess because of the delicacy and the refinement that she shows in her appreciation of dukkha. If she had said, "That was fantastic, that was the best bed I've ever slept in," out—you're obviously a fake.

Dukkha is like that. And this is part of the noble, the way that the arya sees things. What for the ordinary person is pleasurable, for the arya may well be painful. And you can see it in... I mean, it's a question of maturity. So it's possible that at the age of twenty your favorite music is rock and roll played to the nth level of volume. And it's possible that by the age of sixty you're listening to Mozart quietly. Now, one way of looking at

that progression is there's a refinement going on, a refinement of taste, a refinement of appreciation of the dukkha entering the ear. As that develops, so one's tastes become more refined. And this is part of the whole progression of practice.

So dukkha is not necessarily gross. And to get a sense of it, we have to be really sharp and very sensitive to find it, apart from the obvious stuff, of course.

The deepest layer of dukkha is sankhara dukkha, constructed dukkha, or the dukkha of constructions, where the Buddha says in brief, the five bundles associated with clinging are dukkha. Now the five bundles or the five aggregates—we'll look at those tomorrow night—but this is one of the basic ways in which the Buddha divides up the human being and their experience: body, feeling, perception, constructions and awareness. We'll talk about those tomorrow. But essentially it means human experience or the experiencing human being looked at from a certain angle. And the Buddha says in brief, the five bundles associated with clinging are dukkha.

Now this is constructed dukkha. This is all the ways in which we construct our dukkha. So, for example, if you go out for a good time and late next morning wake up in the gutter with vomit stains around your mouth, you are experiencing constructive dukkha. It is gross, but the point is it's constructive.

Or, let's say you're meditating and you've developed a goodly amount of concentration, mindfulness, etc. And you decide, okay, pretty much halfway through the retreat, I've got to go for it. And you sit there for an unusually long period of time and by the time you finish, there's a quality of strain, of tension in the body, strain in the mind. You're not quite satisfied with the result that you've got. You've got dukkha and it's being constructed. So that's more subtle.

More deeply is the recognition that all our efforts to escape from dukkha are in fact dukkha. I recognize that there's a problem, I'm doing something about it, and this very doing is painful because I'm manipulating my experience to make it suit me, and it never works. Whatever I do to make things better, it just becomes part of the problem.

And there is nothing I can do to make it better. This is one of the understandings of dukkha that develops in the course of meditation practice—this recognition that everything I do to avoid, escape, or overcome my problem is just part of the problem.

The Buddha expresses this as: clinging to the khandhas is dukkha. This is the third level. In brief, the five bundles associated with clinging are dukkha. In Pali, this is the *upadana-khandhas*—a compound where you have *upadana* and you have *khandhas*: *panch-upadana-khandhas*.

You might wonder: would you say that's clinging to the self? Clinging to these aggregates as the self? Clinging to constructions? Well, clinging to anything. These are the *upadana-khandhas*, the clinging bundles. You can translate that in various ways. "The bundles that cling" would be a valid translation, or "the bundles that are clung to," or "the bundles that are associated with clinging"—because it's a compound, you can have any relationship between the two parts, which is why you get different translations.

When we speak of *sankhara* in the context of the five khandhas, it specifically refers to the construction of volition—all the choices that we make. So there it has a narrow application. *Sankhara* more broadly means anything constructed, anything put together, and anything that in turn puts something together, that constructs something. That means everything except Nibbana. But in the context of the five aggregates, specifically it means the choices we make—what we do in order to construct our lives.

I remember when listening to Thai teachers, we'd often talk about *sankhara* as if it was thinking. Sayadaw U Pandita's explanation was quite brief. When asked what *sankhara* means, he simply clenched his fist and said, "When the mind does this." That's pretty much it.

Here we encounter the deepest level of dukkha. Notice that the Buddha does not say the five aggregates are dukkha, or the five bundles are dukkha. If he said that, there would be no way out. But he says the five bundles associated with clinging are dukkha—which means he's indicating that dukkha is an optional added extra.

So the deeper we go into our practice, the more refined we discover dukkha. There are times when its universality becomes apparent, and yet it's an optional added extra. We actually don't need it. Otherwise there would be no solution to the problem.

Then we encounter the arising of dukkha and the cessation of dukkha. This is the Noble Truth of the arising of dukkha: it is craving which leads to further becoming, is bound up with obsession and delight, and finds its delight now here, now there—specifically craving for sense pleasures, existence, and non-existence.

It's all about craving—*tanha*, literally "thirst." We've discussed how dukkha is this sense of an empty space, a painful emptiness at our core, and we're constantly trying to fill it in. There's this drive that emerges, this incredible energy that comes bursting out of this empty space, grasping for something to bring in and fill it up.

And this is tanha, this is thirst. This is the drivenness we find within us, the sense of urgent necessity: "I've got to do this." It ranges from the gross to the subtle.

The most obsessive addiction is craving. Have you ever had the experience of meditating and things are going okay except the mind won't completely shut up? It's like you've just got to chase this thought. "Okay, no I won't." But you've got to chase this one. "No, no, no." But you've got to chase this one. That sense of urgent necessity is tanha, is craving. It can be very subtle or incredibly gross and everything in between. But it's that sense of drivenness that we feel, that pushes us forward.

So it's a form of desire. Often people get this mixed up with desire. They think that the Buddha doesn't like desire, that you mustn't desire things, it's very naughty. If you want something, you'll be punished. But tanha is a particular kind of desire that the Buddha very carefully defines. Don't get it mixed up with all forms of desire. Without desire, we wouldn't be here. Without desire, we would not be doing this meditation practice. Desire is fundamentally necessary.

But tanha is a kind of drivenness—driven desire and aversion. The shadow of wanting is not wanting. This drivenness works both ways. It's like if I want the sunny side of the street, I don't want the shady side. If I want the shady side, I don't want the sunny side. If there's movement toward, there's movement away. If there's desire, there's aversion.

We saw it in the Satipatthana Sutta: "longing and sorrow for the world." If there's longing, there's sorrow. If there's sorrow, there's longing. Each is the shadow of the other.

So it's not simply desire. It's the whole sense of drivenness, either towards or away from. But a drivenness that has these particular characteristics: it leads to further becoming. We become someone. We want to become someone. We want to become real to ourselves and to others.

It's one of the attractions of thinking. I think myself into existence. I am who I think I am. I am who I think about. So I think about a world, and if that world is real, it means I'm real because it's my world. And we want to become someone—someone real to others. I want to be recognized as someone, a specific someone. I don't want to be recognized, for example, as a complete idiot. I'd much rather be recognized as a man of wisdom and distinction. You do that, don't you?

This leads to further becoming. We're always seeking to be someone.

Bound up with passion or obsession and delight. *Raga* translates here as obsession. Usually it translates as passion—that's the standard translation, but I think that's wrong. *Raga* literally means colour, and it's the colouring of the heart when it's caught

up in some kind of obsession. In English we have the expression, if someone's really angry, we say "he saw red." In other words, the *citta*, the heart, was coloured red and there was nothing else there.

So it has to do with drivenness, obsession, the inability to see beyond something and therefore to let it go. "I've got to get this. Or I've got to avoid this. I don't care what happens next. I just must have this." This is obsession.

And delight, *nandi*, is the gratification that comes from satisfying a desire. It's the payoff. So I want something, I get it, and there's a payoff. If there wasn't a payoff, I wouldn't bother. So *nandi* is the gratification that we get. But it has a quality of agitation to it, and it sets up another round of desire.

"That was good. I've got to do it again. That's good. One more time. That's good." And again, again, again, and again, and again, and again. So we find ourselves pursuing the same patterns of obsession, of desire, or aversion, as the case may be. It works equally well. And there's a repetitive quality to it. And so it becomes tedious, but still we've got to keep going with it because this is where my satisfaction comes from.

We can see this broadly in consumerism and the whole economic neoliberal project. On the broad scale of things, the fact that as a society we never have enough. So the little thought experiment that I like to provide is: imagine Prime Minister, Treasurer, Governor of the Reserve Bank, they have a press conference, they announce to the nation, "We've been studying the national accounts, productivity, national wealth—they've all increased greatly over the past fifty years. We've reached the point now that we've got enough. We can all stop now. Just chill. Let's take a break. We've got enough."

I mean, it's inconceivable, isn't it? Because it's impossible to have enough. It's just incoherent. Enough? What? It just makes no sense. If you spoke like that in serious company—not like dharma hippies, but serious people—they'd think you're a complete lunatic. "How can we have enough? We've got to grow the economy. We've just got to. True, we're destroying the environment, but we've got to grow the economy. The climate's getting a bit... but we've got to grow the economy." We've just got to, because it's impossible to have enough, and this is *tanha*.

And you can see it more subtly when we're in the grip of some thought, and we can't let it go. I'm thinking something, it causes me pain, I can see that it causes me pain, I can feel it causing me pain, but I've got to finish it off. I've got to keep thinking it. So I'm sure you've had the experience of meditating—a thought arises, you notice that the

thought has arisen, you know that you should drop it and head back to the meditation object, but you decide, "I'll just finish this one off, and then I'll go back." And "this, I'll just finish this one off." This is obsession and delight driving this.

And the Buddha says, "finding delight now here, now there." This is the restlessness implied in the endless search for satisfaction that never quite arrives—looking for a completion that never quite arrives.

He says specifically: craving for sense pleasures, existence, and non-existence. Notice that the latter two, two out of the three, are all about identity. The Buddha is very interested in how we construct an identity and what we do to sustain it.

Anyway, that's briefly the arising of dukkha.

Then we have the cessation of dukkha. This is the Noble One's truth of the cessation of dukkha: the complete cessation of that very craving—abandoning it, renouncing it, releasing it, letting it go.

In another discourse, the Buddha compares the cessation of dukkha to the ending of hunger. We've all experienced hunger, and when we're hungry, we have this growing drivenness: "I've got to eat." So we eat, and there's a great satisfaction when we eat, especially if it's a lunch like today's. There's a pleasure, a gratification that comes out of that. Several hours later, we're wondering, "What's for dinner?" So we go through the whole cycle again, and then again and again and again.

We never get to the end of it. But what would it be like if hunger itself ceased? Then there'd be no pleasure that comes from eating, but there'd be no distress that comes from not eating. The Buddha would say that—assuming this was physiologically possible, which of course it isn't; it's just an image—the pleasure that would come out of the cessation of hunger would actually be greater than any satisfaction we can find from eating.

You could look at it this way: let's say I'm a habitual smoker, and I have a desire for another cigarette. So I reach out and smoke it. There's a gratification, a satisfaction that comes with that—because otherwise I wouldn't bother. But that sets me up for the desire for the next one, and the next one, and the next one.

In contrast, let's say my desire is to give up smoking. If I satisfy that desire, then the satisfaction is very different. It's not driven, it's not restless. It's quite peaceful and still. It's more subtle but more profound, and ultimately more satisfying than the first one.

In a mundane sense, what we're talking about is what we've discussed before: contentment. Being so absorbed in the present experience that we're not ruthlessly reaching out for something else to add to it or to justify it. This has to do with a relationship to experience which is not driven and therefore is pleasurable.

We talked the other night about kaya-gata-sati, mindfulness immersed in body, being all about finding pleasure in the physical—the kinds of pleasure that we're talking about and the kind of pleasure that Siddhartha was referring to when he gave up his ascetic practices. This is the kind of pleasure being referred to here.

Now, just to backtrack: we've got a list of four truths. The first one is dukkha. The second and third are the arising and ceasing of dukkha. Notice with the second and third, there's a dynamism. Things arise and cease. And they don't arise and cease at random.

The arising of dukkha—if there's dukkha, there must be something feeding it. So what's feeding it? What's feeding it is craving. If you get craving, you get dukkha. If I want to get rid of the dukkha, what to do? I could hit the dukkha on the head with a hammer, or I could work out what's feeding it and let go of that.

When there's craving, there's dukkha. When craving is dropped, dukkha is dropped. Notice with these two truths, it expands out from one thing—dukkha—into two, and we've got a dynamic relationship. This relationship is all about cause and effect. In other words, it's about dependent arising. This is the basic framework of the Buddha's teaching, but it's applying dependent arising to a specific problem: dukkha.

So the Buddha is presenting these five companions with a very specific cause-and-effect relationship. He's telling them, "Look for the drivenness." Remember we talked yesterday about why people take up an intense ascetic practice—these men are completely full-on macho ascetics. There's a drivenness in this. That's why they're doing it. And so the Buddha is saying, "Look for the drivenness. Check that out. And is it really satisfactory? And if it's not, why don't you just let it go?"

He's presenting them with a universal principle, which is dependent arising, and he talks about dependent arising endlessly throughout his career in all sorts of different ways. But he's presenting it to them in a very specific example of it, in a particular relationship that is of relevance to them as they're sitting in front of him. So he's making something universal applicable to this situation right now. And that's very much his genius as a teacher—that he had the capacity to do that. And it's quite something.

When I started teaching retreats here, actually, I was doing a PhD in Buddhist studies at University of Queensland, and eventually I dropped out in order to become the resident teacher here. But what I was doing was studying dependent arising and esoteric Buddhist philosophy, and I'd be doing that for months at a time. Then I'd come down here and teach a retreat, and I had to say something that was actually relevant to the meditators sitting in front of me. And it wasn't easy.

Some people think my Dharma talks are abstract, dry and academic. Can you believe that? And if you think they're abstract, dry and academic now—you should have been here fifteen years ago. They were intensely academic. But, you know, that's the way I thought; that's what I was studying. And I knew this is something I need to communicate because this is what the Buddha was all about—so it actually is relevant to someone's experience when they're right in front of you.

If you ever become Dharma teachers, you'll discover it's not easy. So my heart goes out to poor old Buddha when he's faced with these ascetics and he's got to give them the whole lot in one hit. It's not so easy. But he was a genius at that. And this is one example of when he succeeded in doing it.

So you've got one thing, which opens up into dynamic relationship. When we are practicing meditation, what is it we're playing around with? We're playing with dynamic relationship. What is it when we're working with something—a distraction, say? What is it we're saying again and again and again? "What's feeding this? Something must be happening to make this happen. What is it?"

So we talked about structuring attention. I can focus in on one thing, but don't wear blinkers so you can't see what's around it. You can't see it in its context. Open up, and then you can say, "Well, when this moved, that moved as well. That's interesting. Is there a connection?" So it's this open investigation into the shifting patterns of experience, and the basic principle is: What's feeding this? And what does this feed?

And the Buddha is presenting this as a kind of template in the Four Truths. And the fourth truth is the path. And remember this is the second time he's mentioned the path. The path is also the middle way. And it's also the fourth truth. This is the Noble One's truth of the way leading to the cessation of dukkha: the Noble Eightfold Path of right view, right aspiration, right speech, right action, right livelihood, right energy, right mindfulness, and right concentration.

We talked about the complexity of the path yesterday—the fact that it's a dynamic system. Again you get this dependent arising, these dynamic interrelationships. Here, let's have a look at some other aspects of path. For a start, the fact that a path always has a direction. A path is going somewhere. I'm going somewhere.

So I want the path that goes there in order to get to where I want. In other words, I have a goal. And I need the path that takes me to my goal. So I want to be enlightened, or I don't want to be grossly suffering—I want to be subtly suffering. I want a bit of this subtle spiritual suffering that you're banging on about. So I have some kind of goal, and I want the path that goes to that.

We've talked a lot about the nature of right effort. One of the problems with effort is that if I'm pushing what is my present experience aside in order to get to some imagined goal in the future, I'm not fully engaged with the present experience. And it's a barrier. It gets in my way. I overlook things that I shouldn't overlook. I strain, which just slows me up.

So how do goals fit into this way of looking at things? The Buddha doesn't talk—he does talk about goals, setting up goals—but he's more interested in directions. It's all about setting a direction. If I know that my goal is in this direction, if I've got the direction right, I can forget about the destination. I can forget about the goal because I know I'm going to get there. And instead, all I have to do is be fully committed to this step right now. This is part of the image of the path: being firmly grounded on just this step. This is the only step that counts. And if I'm satisfied about the direction, I don't need to worry about the goal. That will just happen. It may take a while, it may take longer than I want, but it will happen. I've just got to be completely engaged with this step right now.

Another aspect of path is that it implies that someone else has been here before. We've talked about this. In this path that we're on, people have been on this path for over 2,000 years. And we're just the latest bunch of travelers. There'll be other people after us. So we're part of something much bigger than what we might normally think of.

The Buddha also points out that the path is a lot more than just meditation. We spoke about how the path has three groups: there's view, which is wisdom; sīla, ethics; and then you have meditation. In one discourse, a non-Buddhist asked the Buddha what he taught, and the Buddha said, "I teach two things. I teach ethics and wisdom." Which is very interesting because he made no mention of meditation. And it's very odd from a Western perspective because what draws us into Buddhism is it's all about the medita-

tion. Then we discover the other things later. But when the Buddha was presenting his teaching to non-Buddhists, he didn't even mention meditation. He said, "I teach two things: ethics and wisdom."

And he compared them to two hands washing each other. I can't wash just one hand. I need two hands. Then I can clean the hands. Ethics is like one hand and wisdom is the other, and they wash each other—they support each other. I think what he was getting at was that if we're looking for meditation, it's here. It's in this action. It's the interface between ethics and wisdom. In particular, whatever we cultivate in meditation has to be expressed in action. In other words, the test for our practice is the way that we live, which is the whole realm of ethics.

Anyway, that's a quick tour of the Four Truths. And the Buddha goes on a bit further, talking about each of the activities or the duties associated with each of the truths. So the first truth, dukkha, is to be fully understood. And it's interesting that he doesn't say it is to be gotten rid of. He says it's to be understood. In other words, we study our dukkha.

The second truth, the arising of dukkha, is to be abandoned—the letting go of craving. The third truth, the cessation of dukkha, is to be realized. This is awakening itself. And the fourth truth, the path, is to be cultivated, developed.

Then we come to the end of the discourse. "This is what the Blessed One said, and the group of five bhikkhus rejoiced in his words. And as this teaching was being given, the perfect and stainless vision of Dharma arose in Venerable Kondanya: 'Whatever is of the nature to arise, all that is of the nature to cease.'"

This little verse is the standard verse which indicates the perfect and stainless vision of Dharma—in other words, attaining the first stage of awakening, the first glimpse of the unconstructed, the first falling into the black hole and never being seen again. And this happens to Kondanya, and the way he expresses it is: "Whatever is of the nature to arise, all that is of the nature to cease." Again, this is a model of dependent arising. He saw into dependent arising.

So whatever is of the nature to arise—what would that be? Basically everything, except nibbana, except the unconstructed. Whatever begins, ends. Everything that arises ceases. And the emphasis is on the everything. What we do is we kind of set aside something out of that which doesn't cease. Let's call it, for example, the self. This is the sense of the self—it's all happening to me, I'm the audience of this drama, without me there's

no drama. But the Buddha says all this is of the nature to cease. Or as John Hale once was heard to remark, "Nibbana is the ultimate paint stripper—it strips away everything."

So Kondanya was the first to get it.

Now, do we have time for his story? Yes. Kondanya was a brahmin who was very brilliant as a boy and was particularly specialized in the art of reading features, reading the body—physiognomy. He made a living along with others as a kind of soothsayer, examining newborn children to tell their doting parents, on the basis of his examination, what would happen to them. Astrology and the reading of features—these kinds of arts were highly developed in India, greatly respected. People who did this were highly respected and well-paid professionals.

When Siddhartha was born, his father brought in the local experts. Because his father was a wealthy and powerful man, he could afford five of these experts. So he brings them in to examine the boy and to explain what the boy's fate would be. Kondanya was the youngest of the five, therefore the most junior in the hierarchy.

They examine the boy, look at his horoscope, do their calculations, get together in a huddle. And the four senior ones said, "There's no question, this kid is going to be a universal monarch, an extremely successful political leader." They were happy with that because they'd doubtless get a big tip from his old man for telling them that.

But they couldn't come to consensus because Kondanya said, "No, no, no. He may do that. Or, if he leaves home, he will become a sammasambuddha, a supremely self-awakened one."

The other four said, "You don't want to tell the old man that. Believe me, he doesn't want to hear that."

Kondanya sticks to his guns. Then they explain, "Look, we've seen you do this. We've been doing this longer. All of us agree it's not going to happen. So just keep your mouth shut."

And Kondanya says, "I shall submit a minority report."

So he did. And the other four were correct—the old man didn't like it at all. So they walked away with less cash than they would have, except that Kondanya didn't walk away. He wanted to stick around this kid because he knew this kid was very special, and if he does something really special, "I want to be there when it happens."

So he sticks around, he lives in the neighborhood and he waits. And Siddhartha grows up and he's having a good time and being educated and doing all the things that young men do, and Kondanya's life is dribbling away, waiting. He must have got anxious every now and again, but he recalls his faith and he stays.

One morning he's in the market buying his chai or whatever he buys in the market, and the market is abuzz with gossip. He hears the word "Siddhartha" mentioned, so he goes up and says, "What's going on? What happened?"

And they say, "Didn't you hear?"

"No, I didn't hear. What happened?"

"Wow, you must be the only person who hasn't heard."

"Stop driving me crazy and just tell me what happened."

"He's gone."

Who's gone?

Siddhartha's gone.

What do you mean he's gone?

He's just gone. He just disappeared last night. Nobody can find him.

And so Kandanya is just absolutely horrified. He's been waiting for decades. It's like watching cricket—as soon as something happens, you've missed it because you've fallen asleep ten minutes ago.

So he goes racing off in pursuit, but nobody knows exactly where Siddhartha went because he slipped out at night. But Kandanya is no fool and he heads southeast along the same main road that Siddhartha is traveling. Eventually he catches up with him, though nobody really knows when, or how many years it took before he found him.

But he ends up as one of the five companions. So he's one of these ascetics. And this time he's absolutely determined he's not going to let this guy out of his sight because he knows his propensity for disappearing. So he's practicing asceticism, which is really, really not a good thing to do. It's very painful. So he's having a very difficult time. He's not a young man anymore. But he's got to wait. He's got to wait until something happens.

And finally, something happened. Siddhartha has lunch.

Well, he drops the whole thing. He decides, "Okay, it's not working. I'm out of here. I'm heading to the village down the road because I hear they serve really nice chapati."

And all of the five are just completely devastated by this betrayal of everything he stands for, Kandanya among them, and they walk off, they leave him.

Now if you put yourself in Kandanya's shoes, how would you have felt? You have invested virtually your entire life on hope and faith in one person, and eventually, after decades, he completely disappoints you. He disillusions you so much that not only are you not looking for him, you're making sure you're walking away in the opposite direction. So Kandanya must have gone through hell.

Anyway, sometime later—we don't know how long—Siddhartha returns, except he's not Siddhartha, he's the Buddha. He gives the first teaching, and Kandanya gets it. That's what he's talking about. And he's the first to attain a glimpse of awakening.

So if you ever feel discouraged in your practice, if you ever think it's taking too long and progress is too slow, just think of Kandanya. He's the patron saint of slow students.

"When the wheel of Dharma had been set in motion by the Blessed One, the earth-dwelling devas cried out: 'This unsurpassed wheel of Dharma has been set in motion by the Blessed One. It cannot be stopped by any samana or brahmana or deva or Mara or Brahma or by anyone in the world.'

"Hearing the cry of the earth-dwelling devas, the devas of the realm of the Four Great Kings cried out. The Tavatimsa devas, the Yama devas, the Tusita devas, the Nimmanarati devas, the Paranimmitavasavatti devas, the devas of Brahma's assembly cried out: 'At Baranasi, in the deer park at Isipatana, this unsurpassed wheel of Dharma has been set in motion by the Blessed One. It cannot be stopped by any samana or brahmana or deva or Mara or Brahma or by anyone in the world.'

"And so at that moment, at that instant, the cry spread as far as the Brahma world, and this ten-thousand-fold world system shook, quaked and trembled, and an immeasurable glorious radiance appeared in the world, surpassing the divine majesty of the devas."

I think this is code for "something very significant just happened."

And what happened was the wheel of Dharma was set in motion. When did that happen? When somebody understood. Yeah, when Kandanya got it.

And I find it really intriguing. When the Buddha was awakened, the wheel of Dharma was not set in motion. Only when Kandanya got it, then it started to move. In other words, the wheel of Dharma moves when the understanding spreads. Then things are starting to happen.

this realization, this awakening will not die with the Buddha. It will continue. And of course the wheel of Dharma has been turning ever since and continues to turn.

Then the Blessed One cried out in inspiration: "Kondañña understands! Kondañña understands!" This is how Venerable Kondañña acquired the name Añña Kondañña—Kondañña who understands.

You don't get it in English, but what the Buddha said was "Aññāsi Kondañño! Aññāsi Kondañño!" "He understands! He understands!" And I find this very intriguing.

I cannot think of any other time when the Buddha responds this way. Here he's given everything he's got, and as a result, one out of five has received the first glimpse of Nibbāna, of the unconstructed. Later in his career, he gets on stage, gives a Dharma talk, and five hundred people attain full awakening. He just got better. This is his practice run.

But this is the only time where he dances a jig for joy because someone got it. He's up there dancing: "Kondañña understands! Kondañña understands!" Abandoning all enlightened dignity. But he never does it again.

The traditional schools interpret this differently. Some say he was sitting there with a little smile on his face. Others say he cried out in inspiration—this is udāna, spontaneous poetry composed on the spot and presumably sung out in great joy, not mindfully mumbled but sung with delight.

The Buddha is absolutely delighted. He knows he can communicate this. Now he is a teacher—not just claiming to be one, but actually embodying what it means to teach. Now there is something happening. Now there can be a Buddhism. Now it's possible that things can start moving.

And this is where we'll leave it tonight. Tomorrow we'll start on the second discourse.

"If the wheel is set in motion and nothing can stop it, why is Mahākassapa waiting in a mountain until after it stops for it to start again?"

It just runs out of steam. No one can stop it, but somewhere in the future it will naturally cease. That's the nature of things—whatever has a beginning has an end. But then it can start again, given the right conditions.

"Did the Buddha say anything about Paccekabuddhas, explaining how many there might have been?"

No. In the early material there's very little mention of them.

Previous Buddhas at all, or I can't recall mention of Paccekabuddhas specifically, though they might be referenced somewhere. If it appears in the Tipitaka, my guess is it would be in the Khuddaka Nikaya—in the later material.

These are Buddhas who realized enlightenment but weren't able to teach. Is it a real phenomenon or not necessarily? I can't recall having read about it in the early texts. I've seen it mainly in the Jatakas—the story collections that come much later. I'm not certain whether it's part of the early tradition, although it's built into the logic of it, isn't it?

Had the Buddha not succeeded with those first five ascetics, presumably he would have thought, "I'll give up," gone back to his Bodhi tree, and remained a Paccekabuddha. I'd never realized what a close shave it was. I mean, I'd thought about how fortunate it was that Brahma Sahampati persuaded him to teach, but I'd never considered the next close call.

It sounds like a whole series of pretty close shaves. But the conditions came together and suddenly—there it is. That's the way things work. When conditions converge, something suddenly clicks.

"How soon after do they all become fully enlightened?"

That's for tomorrow night. Stay tuned for the next exciting episode.

"Is a glimpse—like you're describing—stream entry?"

"Can people still experience nibbana hearing a dharma talk? For the first time?"

Technically it's possible. I suspect all those who had the past-life karma and practice that would predispose them to such realization may have already encountered the Dhamma and awakened. Or perhaps they simply don't tell us about it, and it happens regularly without anyone hearing about it.

They speak of transmission in various traditions—not so much in Theravada teachings, but in Mahayana and Vajrayana they discuss transmission extensively. When the Buddha gives a talk and many people become enlightened, it's quite reminiscent of those later transmission-oriented contemplative traditions. It doesn't remind you of Theravada so much as the Tibetan and Zen approaches—it has more of that flavor.

"Patrick, you mentioned dukkha as this sort of painful emptiness. Do you think that's our intuitive understanding that the self isn't real?"

Yes, I think so. I believe fundamentally we all know that we're not real—that this sense of self is constructed. But we cover that up with all our desperate projects to be recognized and to recognize ourselves as substantial. Much of human endeavor is based on this deep but deeply suppressed intuition.

"Unknown thousands in therapy trying to find out, trying to be convinced that they are real."

The way of therapy is often the way of self—getting a healthy self, presumably.

I know that Stephen Batchelor discusses the Four Truths as being sequential, and I've found that whole discussion quite illuminating. It gives meaning to having dukkha in the first place.

It's almost like sequential in that you need to realize dukkha first, and that leads to the realization of the cause of dukkha, which leads to the realization of the cessation of dukkha, which leads to the realization of how to live that life of cessation. It's quite useful, I think.

I mean, this is a list. And like other lists, it can be read in different ways. It can be read in a linear form, and it can be read in a non-linear form. I think it's deliberately... I think it's meant to be like that. There are different ways of reading it. These lists are really sophisticated. I don't think there would be just simply one correct way to read it. If you point out a different way of reading it, it gives you a fresh viewpoint, which is very useful.

Question: Isn't there a certain amount of drivenness needed, more than just mere desire to actually stay on the path? It's not like it's super easy, after all, and you know, we can talk very well about desire for awakening and desire for the end of dukkha, but without a certain amount of clinging, thirst, drivenness, to keep on keeping on, you know. Otherwise, lots of people come to meditation once or twice, but don't stay on the path.

Response: Yeah. I was reminded of a conversation I had decades ago when I was in Hawaii. I was talking to a fellow Zen student about another Zen student who had been practicing for a number of years—I forget how many, but not inconsiderable. He suddenly dropped out. And everybody was wondering why. And my friend said, "Well, he obviously got what he came for." And I thought, yeah, that makes sense.

It's the people who don't drop out who are the people, in a sense, whose desire always outmatches, always goes beyond what they've attained. And the Buddha talks about this. He says, don't be satisfied with what you've attained. There's always something more. So the drivenness is part of nature.

So I think, yes, you're right, it's part of the whole path. But it's a question, I think, of using it skillfully. The quality of it. Because the quality of it is refined when you practice. But there is a quality of... a sense of, "I have to do this. I don't have a choice." In one sense I do, but in a deeper sense... I don't.

Okay. Thank you very much. Thank you for listening.

CHAPTER 22

The Not-Self Characteristic (Anattā) - Part 1

Patrick Kearney · 1h11

> *In this profound discourse, Patrick Kearney introduces the Anattalakkhaṇa Sutta (SN 22.59), the Buddha's second teaching delivered to the five ascetics at Isipatana. Kearney emphasizes a crucial point: the Buddha waited until all five companions had attained stream-entry before teaching anattā explicitly, suggesting this is an advanced teaching meant to be realized rather than merely understood intellectually. Like a joke that either lands or doesn't, anattā cannot be grasped through explanation alone.*
>
> *Kearney examines the Buddha's systematic deconstruction of self through the five khandhas (aggregates): body, feeling, perception, constructions, and awareness. He unpacks the three movements of self-construction—'this is mine' (taṇhā/craving), 'I am this' (māna/conceit), and 'this is myself' (diṭṭhi/view)—showing how we constantly construct identity through possession, measurement, and narrative. The teaching reveals that what we take to be a stable self is actually an ongoing process of construction, fueled by our drive for certainty and meaning.*
>
> *Particularly illuminating is Kearney's analysis of how the Pāli term 'anicca' means not just impermanent but unreliable, explaining why impermanence leads to dukkha. He invites practitioners to investigate directly: Can you find the one creating your thoughts? Can you locate the audience for your internal narratives? This empirical approach transforms anattā from abstract philosophy into living practice, pointing toward those moments of complete intimacy with experience where the sense of a separate self naturally falls away.*

Yesterday we finished off the Dhammacakkappavattana Sutta, setting in motion the Dharma wheel, or simply turning the Dharma wheel. This was taught on the full moon night of Āsāḷha in July, two months after the Buddha attained awakening. And there he taught the middle way and the four truths.

The middle way was the strategy he used to break open the resistance of the five companions. This is the idea of the middle way here in terms of practice—between indulgence and asceticism—where the middle way is not halfway in between, but it's the place of no fixed position. If it was halfway in between, that would simply be another extreme, a kind of triangular model. The middle way can only be found where there is no *anta*, no extreme. No pushing away, no pulling towards. This is the place where we are not stuck on anything. This is the place where we're not reaching out to hold some-

thing and we're not rejecting or resisting something. And this place is not any kind of fixed position. It's constantly moving and dancing, and we're constantly trying to keep up with it.

Then the Buddha taught the Four Truths, and Koṇḍañña understood. He had his first glimpse of awakening and attained the first stage of enlightenment, stream entry. He became Aññā Koṇḍañña, and his insight was expressed as: whatever is of the nature to arise, all that is of the nature to cease. So this is all about dependent arising and, of course, impermanence.

The Buddha is very happy. Someone's actually understood, and he's very pleased with the whole situation. The five companions now become his students, so there's now a practice community. Then they begin the practice—the first Buddhist meditation retreat. The five students, with the Buddha as teacher, the retreat lasts I think five days. It's a long retreat because they took a while to get enlightened. There was Vappa and Bhaddiya, who got it within the first couple of days, and then Mahānāma, and finally Assaji, who was just incredibly thick. Five days together. Anyway, finally he did.

So at the end of this retreat, there are five aryas, five cultivated ones, refined ones—or six altogether, including the Buddha. And as each one attains the first stage of awakening, they request and are given ordination. So at this point there are five bhikkhus. It's interesting that you can see the standard is pretty high for becoming a bhikkhu. You have to be awakened first. Standards have slipped since.

When all of the five have attained the first stage of awakening—so they've all had a glimpse into the unconstructed—then he gives them the second discourse. And this is the Anattalakkhaṇa Sutta, the not-self characteristic.

Now what this suggests, if you look at the context, is that he hasn't actually mentioned anattā, not-self. Of course it's obvious, it's implicit in everything that's gone before, but he's never actually mentioned it. And now for the first time he talks about it and gives a discourse explicitly on the subject of not-self. But he waits until his entire audience have attained the first stage of awakening. And he teaches it with the intention to bring them to full awakening.

What this suggests is, first of all, this is an advanced teaching. Anattā is an advanced teaching. And the other aspect about it is that anattā fundamentally is not a doctrine that can be understood—although lots of scholars and academics spend a lot of energy understanding it, writing about it, and so on. But fundamentally it's not a doctrine which is to be understood; it's an experience which is to be realized.

I see it as Buddha's joke. If you tell someone a joke, and having given them the punchline, they look at you blankly and say, "Could you explain that?"—you know you're wasting your time. Even if they understand it, quote unquote. "Oh, is that why it's funny? Oh." It hasn't worked. With a joke, you either get it or you don't get it. And that's it. And anattā has the same quality. You either get it or you don't get it. You either see it or you don't see it. And this can be shown by the endless academic arguments about it that have gone on through the centuries and continue to go on.

I put all this forward as a preliminary to my caveat: we're going to have two or possibly three talks about this, and I am not suggesting that at the end of them you will understand anattā.

I'm suggesting that at the end of them you will not. So don't blame me—I warned you in the beginning.

One time in Sydney, a fellow who was a long-term practitioner and very active in local Buddhist circles said to me, "You know, over the years I've heard a lot of Dharma talks from a lot of teachers about not-self, and no one's ever explained it satisfactorily." And he looked at me, and I thought, "I hope he's not going to ask me to explain it." Mercifully he didn't. But that's when it really struck me—you can't understand it. You either get it or you don't get it. And it's not easy to get. Well, it is easy to get. But it's not easy to be in the situation in which it's easy to get.

Now, these monks have all attained the first stage of awakening, so they've seen into it. But there's something missing—something still that they haven't got. Yet they've certainly got something. Or they haven't got something. And that means they're ready to receive the full teaching. At the end of the discourse, in fact, they're all Arahants. So this takes them from the first stage to the final stage.

"This is how I heard it. Once the Blessed One was living at Bārānasī in the deer park at Isipatana. There he addressed the group of five bhikkhus.

'Bhikkhus?'

'Bhante,' they replied.

The Blessed One said, 'Body is not self. If this body was self, it would not tend to get sick, and I could make it become what I want. But because body is not self, it does tend to get sick, and I cannot make it become what I want.

'Feeling is not self. Perception is not self. Constructions are not self. Awareness is not self. If this awareness was self, it would not tend to get sick, and I could make it become what I want. But because awareness is not self, it does tend to get sick, and I cannot make it become what I want.'"

That's the opening line. The word translators render as "get sick"—*ābādha*—can be translated as affliction, illness, or disease. So it's a kind of "there wouldn't tend to be anything wrong with it." It wouldn't tend to be problematic, would be another way of looking at it.

Now, what I find interesting here: first of all, the Buddha goes through the five aggregates, and this is the first time he's laid them out. We've talked about these before. *Khandha*—usually translated as aggregate. I like Stephen Batchelor's translation of "bundle."

Whenever the Buddha talks about anattā, he will talk about it in terms of these five aggregates. But notice that the first time the Buddha mentions not-self, he presents it as bad news. "But because body is not-self, it does tend to get sick, and I cannot make it become what I want." I find this very interesting because certainly in Mahāyāna Buddhism—at least the Mahāyāna Buddhism I've been exposed to—not-self is always presented as "Hallelujah, brethren! This is fantastic!" Even in Theravāda it's got a kind of good news ring to it. But the first time the Buddha mentions it, it's clearly bad news.

Anyway, he's laying out the five aggregates. He mentioned them in the first discourse—*pañca upādāna khandhā*, the five aggregates associated with clinging. Now he lays them out. Body is all physical experience. Feeling, we've talked about—the hedonic or affective aspect of experience, that which moves me, that which provokes a response.

So I'm moved to hold on if it's pleasant, I'm moved to resist or reject if it's painful, and I'm moved to ignorance, doubt, confusion if it's not registered as being either painful or pleasant.

Then perception—saññā—which I think we mentioned. This is the recognition or interpretation of any experience. In other words, what makes something familiar? We live in a familiar world. I know what this place is, I know who you are, I can understand these words. This is all the realm of perception.

Then constructions—here it means all choices or decisions to act. I think we talked about this last night.

Finally, awareness—viññāṇa—the pure knowing or witnessing of any experience.

Now, these aggregates are associated with clinging. In other words, they constitute that which holds the potential for clinging, upādāna. That which we cling to. What we find irresistible, essentially. If they're associated with clinging, then they have to be attractive, because otherwise we wouldn't bother. Why would I cling to something that was not attractive to me?

But they're attractive not in a superficial sense of being nice-looking and pleasant, but in the deep sense of being what preoccupies us the most. So what most deeply preoccupies me—these are the five aggregates.

Consider, for example, our relationship to mirrors. Every day I look in the mirror. If there's a mirror around to look at, I will look at it. If it's not around, I won't. But if it's there, I'll have a look. Why? I know what I look like. But I just want to check one more time.

Or take the attractiveness of our deepest pain that can arise during meditation practice. It's incredibly attractive. Not in the sense that it's pleasant, but in the sense that it attracts our attention. Bam! The attention goes straight there and we hold on to it ferociously. So it's deeply attractive, and we cling to it.

Now, for the Buddha, clinging results in identity. This is why we hold on. And so the five aggregates are associated with the construction of an identity. When we cling, we know who we are and we know what we are. In that moment of holding on, that's when my identity is clearest. So that's who I am—the face in the mirror. This is who I am—the one who suffers this pain.

The aggregates provide identity, and the attractiveness is that identity provides certainty. In the moment that I know who I am, I also know what the world is and what's going on. That identity is deeply satisfying and reassuring, even if what I take to be me in the world is incredibly painful. Still, at least I know who I am and what's going on.

The Buddha's first argument about not-self has to do with this sense of certainty. He undermines it by looking at the issues of control, reliability, predictability.

Body, mind, all experience is not self. If it was self, it would not tend to be sick, oppressed, afflicted, and I could make it become what I want. It would be under my control. But because body and all the rest is not self, I cannot make it become what I want. It does tend to be spinning out of control and being oppressive.

When we actually examine the nature of experience, one thing that comes up—which is really quite obvious for the meditator—is that I am not actually in control of what happens to me. I spend a lot of time trying to assert my control. If I come to a retreat, I plan carefully. I bring all the right stuff, especially if I know the place. I come early so I get the good room. I get into the hall as soon as possible, get the best cushions, set myself up where I want to be. I'm trying to impose some degree of control and predictability and reliability into the experience.

The more familiar I am with the whole place, the more I can cultivate this notion that I can do this. The more familiar I am with the meditation practice, the more I can create fantasies that this time it'll be different. This time I'll be in charge.

But of course, it always fails.

It always falls apart. And the more we examine our experience, the more obvious it becomes that we're not in control. Nothing is entirely reliable, and I cannot predict the future. I do not know what's going to happen next. So the Buddha is undermining this assumption of self by undermining our sense of control and therefore reliability, predictability.

Now for the Buddha, first of all, he's looking at self—in Sanskrit *ātman*, in Pāli *attan*. *Ātman* is a technical term you find across traditions in India, and you've always got to be careful about the technical terms because what something means in one tradition isn't necessarily what it means in another tradition. Different traditions often share the same vocabulary, but they mean different things.

So *ātman*—when we talk about *ātman*, self, we think about Hindu traditions. But the Buddha's not using *ātman* in that sense. He's using it in a more psychological sense. If one was speaking to a Vedantan and asked, "How many *ātmans* are there in this room?" the answer is obviously one. In fact, there's only one *ātman* in the entire universe. But from a Buddhist perspective, how many *ātmans* in this room? Well, there's, I think, nineteen. Each person is an *ātman*. So the Buddha's using self in a psychological sense, which is good for us because it's more familiar to us.

What he's talking about now—to regard oneself as a self, what do we need? What's required? First of all, we have to be separate and distinct from other selves. I'm me, which means I'm not you. So I have to have that clear sense of separation and distinctness. This is me. I am an individual. I am unique. And I am certainly not you. So that's the first thing I need.

And I have to possess some unchanging characteristics that can provide me with some stable sense of identity through time. In my life I go through many ups and downs. I go through many changes. But I have a sense that underneath all that, it's me who's undergoing these changes. That twenty years ago, I and my life were quite different. Many things have happened in the past twenty years. Many changes. But at the end of it, it's me. So there have to be some characteristics of the self that do not change, that provide the sense of stability on which I can build an identity.

And finally, possession always entails some degree of control. Possession is in the normal everyday sense of the word. For example, take this watch. This watch is my watch, so I'm the one in charge. You can't tell the watch what to do. You can't tell me what to do with it, because it's my watch. Now as for your watch, it's up to you. I've got no argument with your watch—unless it ticks loudly when I'm trying to meditate—but basically it's all up to you. So if I had no control over this watch, how could it be mine? It just wouldn't make sense.

So a possession always implies some degree of control. Possession also includes aspects of myself to which it makes sense to describe as mine. When we were talking about mindfulness immersed in body, we talked about how we have this relationship to this body. This is my body. Now that makes perfect sense to me. That's your body. You do what you need to do with it. But this is mine. So I'm in charge of this body. I'll decide when this body leaves this room, not you. Are we clear on that?

So we have to have a sense of separation from other selves. We have to possess, have to have possessions, at least some of which are sufficiently stable that they can provide a sense of identity over a period of time. And whatever it is that we think we possess, we have to be able to have at least some degree of control over it.

The Buddha is in this opening section challenging these last two assumptions: possession and control. And he does it through the recognition of *dukkha*, which makes sense because he's just been talking about *dukkha*. So he now applies *dukkha* to the self. The fact is that there's *dukkha* in every experience that we depend upon, that we hold on to as constituting me. In every single one of those, somewhere in there is *dukkha*. There's an absence of control. I'm not in charge. And if I'm not in charge of it, it's not mine. So I don't own it.

The Buddha is undermining some of the basic assumptions that the ascetics hold in terms of their belief that they are someone. "I am an ascetic of some seniority, respected among my fellow ascetics. I'm someone." And he's starting to just tear this apart through his first argument.

And then the Buddha moves on to the issue of change, impermanence. "What do you think, bhikkhus, is body permanent or impermanent?" "Impermanent, Bhante." "And that which is impermanent, is it painful or pleasurable?"

Painful, Bhante. And that which is painful and subject to change, is it appropriate to regard it in terms of "this is mine, I am this, this is myself"? Certainly not, Bhante.

So here the Buddha shifts into impermanence and brings this out front and centre. Experience is impermanent, it is anicca, it changes.

Now when I first read this discourse, which was sometime in the mid-seventies, I found this dialogue very odd. Is body permanent or impermanent? Impermanent. Yes, okay, sounds reasonable. And that which is impermanent, is it painful or pleasurable? Painful. And I thought, what? Why? What's the problem? I just couldn't see the problem. I mean, if nothing changed, things would get pretty tedious pretty quickly. Don't they say a change is as good as a holiday?

So this really bothered me when I first read it. I just couldn't figure it out. I did not get the logic. Buddha, you said it, apparently you're wise, but let's just move on here.

It helps to actually look at the Pali word, anicca, or in Sanskrit, anitya. In Pali and Sanskrit, nicca or nitya means permanent, but it also means reliable. Let's say one is running a meditation centre and feels a certain insecurity about paying the bills. But then someone leaves a bucket full of money in some kind of trust account, and so there's a permanent income. Every year the centre is guaranteed this amount of money handed to it. It's permanent, it's reliable. Let's say you're looking for farmland and you're told this has a permanent water supply. It's permanent, it's reliable.

So when the Buddha says permanent, he's not just saying it doesn't change—he's saying this is reliable, I can depend upon this. When he says that which is impermanent is painful or pleasurable, the monks of course say painful because they know what this means. What the Buddha is saying is that all experience is impermanent, it changes, and therefore it is unreliable. Ultimately we will be disappointed with it, whatever it is. At some point we will be disappointed. We will be let down. And this is just part of the nature of the universe.

So whatever we experience, at some point, becomes a source of distress. And therefore it's not worthy of holding onto. In fact it's something to be let go of. Therefore it's not worthy to be considered self. Because to be considered self it has to be reliably available all the time. So for me to be Patrick, Patrick has to be available all the time.

Does that make any sense? No? Why not? Why does it have to be reliable to be self? It can be unreliable, provided that it's there to be unreliable—as long as it's reliably there. Like, "this is happening to me," I can count on that. Let's go on and see if it makes any sense later.

So the Buddha says that which is painful and subject to change, is it appropriate to regard it in terms of "this is mine, I am this, this is myself"? Now here the Buddha presents what he means by self. This is important because if he's going to deny self, then we've got to know what it is that he's denying. He's talking about identity, and we assume identity is something given.

So I am already Patrick. But the Buddha is saying identity is an ongoing construction. It's not something already given. It's something that we're constantly constructing. We don't notice ourselves doing it most of the time, but we are. This is in fact what we're doing.

And he says there are three movements in this construction: this is mine, I am this, this is myself. These three movements are craving, conceit, and view. So let's have a look at what the Buddha is getting at.

The first one is "this is mine." This represents taṇhā, which we talked about the last couple of nights—craving, drivenness. Here, it's the drive to possess. This is the raw energy. We talked about how dukkha represents this painful energy, empty space at the core of our being. From that painful emptiness we reach up and try to hold something, get something that we can draw into this space and fill it up and get rid of this sense of unease. We're constantly going out to hold onto something as a possession. This is taṇhā, or craving, and this is what drives consumerism and narcissism.

We talked about it in terms of consumerism—how we constantly want more stuff. The appeal to greed is usually pretty successful in terms of social movements. But more subtly, we can see it in our drive to possess experience. When you come to talk about meditation experience, say in the interview, whose experience do you come to talk about? "Let me tell you about *my* meditation experience." We talked about this basic attitude we have to experience: What is this to me? How does it fit into my plan? How does it function as my possession? So this is *my* meditation experience. And we just do that quite naturally. We don't even think about it. It's just obvious. Of course it's mine. It's certainly not yours. So it has to be mine. And if I feel I've had a very successful retreat, I might say something like, "I got a lot out of this retreat." We use that kind of expression quite naturally. It's totally meaningful.

So this is the drive to possess. And possession has to do with identity. Where is the boundary of the self? Where does the self end and the world begin? Most obviously the border would be here, at the edges of this body. But in fact, of course, the boundaries are wider than that. This recorder is outside the boundaries of this body, but because it's mine, it's inside myself. My sense of self as the teacher—by the way, these are *my* Dharma talks. Are you sure? I'm positive. No, no.

And this is another thing. This is the next thing. This is *my* meditation retreat. I'm the teacher. I'm in control. And I don't want you lot messing up my meditation retreat. I'll be clear about that.

So when we start to look at the self in terms of possession, the boundary of the self starts to go out and it gets bigger and bigger. You're not my teacher, I'm your student.

That's right. So you're all my students and I'm in charge. That's why I'm constantly frustrated and disappointed.

So if you're in charge, how come you haven't made us all be enlightened yet?

Well, I'm trying to persuade you, but you're just resisting me all the time. So on the one hand... stop mucking about. You've been too relaxed.

So "this is mine" is all about creating this sense of self and making it bigger, and the bigger the better.

Then we get conceit: "I am this."

The Pali term is *mana*, usually translated as conceit. It's not a very good translation, but there's no English equivalent. Literally, it's measuring. If you did a literal translation, it would be measuring. It is a measuring, from the root *ma*, to measure. So measurement, comparison.

I think I mentioned this before. Let's say I measure something. I take out of something—this pad—pull out the tape and measure it. Now in measuring it, what I've just done is define its boundaries. This is where it begins and this is where it ends. And that means I've created separation. This is pad and all of this is not pad. So you get a basic sense of boundary and separation.

Mana manifests as a fundamental sense of separation and therefore of comparison. First of all, there are borders: me, not me; this, not this, that. And also, part of this duality involves values—important, not important—and along with that, comparison between them.

So a lot of this has to do with a sense of location, location in relation to the self. "I" and "mine" are both here, and they're important. "You" and "yours" is a bit further away, so not quite so important. "Them" and "theirs" is even further away and even less important.

Now this distance can be physical, but it can also be—in fact largely it is—psychological. So let's say in the media if there's a disaster in India, it'll be on page five with half a column. If a corresponding disaster occurs in the US, it'll be on page one with several columns. It would be more important because the USA is closer to us than India. Now that distance is not geographical. It's in terms of our identification. We're much more likely to identify with people from North America than we are with people from India. So India is more distant.

For Australians, you can see it in the sense that Europe is much more close to us than Southeast Asia, for most people. Europe is far closer than Southeast Asia. Southeast Asia is the place you fly over to get to Europe. And again, this has got nothing to do with geography. This has to do with the sense of what's closest to me, what's me and not me.

So this has to do with *mana*, classically translated as conceit, but really measuring.

Now, craving and conceit come together. Craving energizes conceit. Conceit manifests in the basic sense of "I am" at the behind of experience. There's this sense that I have that there's someone here who is experiencing. So at the moment I'm experiencing giving a Dharma talk, and I have this sense that this is happening to someone, and the someone is here.

Now if as a meditator I was interested in finding out, well, who is that someone? And if I turned my awareness around and went into the *citta* to find that someone, whatever I found—that would be happening to someone. So whatever I found would not be "I am." Does that make sense?

So when you're practicing you can have a very deep *samādhi*, concentration. You can be very intimate with the experience. A sense of self and other, in a crude sense, has dropped away. But there's still this sense that all of this is happening to someone, but you can't put your finger on who that is, because it's always in the shadows.

Now you take this sense of "I am," add craving—and craving is this raw drive—

always in search of possession. So then it becomes "I am this." The mind reaches out to grab an experience, to identify with it. "Oh, this is what I am."

So we might be meditating, for example, and the mind is throwing up thoughts—they're just kind of bubbling up and disappearing, bubbling up and disappearing. But if we look at the process, suddenly the awareness reaches out and grabs onto one of those thoughts, bang, and turns it into something. What's happened is there's this kind of background sense of "I am," but there's an agitation in it. "I am, but what am I? I am, I am..." Bang. "I'm this. I'm this thought. This is what I am." And suddenly we're into creating an identity. So this is the movement: "I am this." Conceit.

And then finally we get view: "This is myself." This third one, view, is the most visible, the most surface of the three movements. And to a large extent, it's the culmination of the construction of a self into some kind of narrative—some kind of story that defines myself to me and to others.

I always like to quote Daniel Dennett, the American philosopher of mind. He's still going strong, very fashionable, a very good writer. Back in the nineties he wrote a book called *Consciousness Explained*, where he says that we do not tell our stories—our stories tell us. Which is a very nice way of putting it. And he says there are some stories that we keep coming back to again and again and again. These are foundational stories that he calls "the center of narrative gravity." So they all come back to these ones. And if we're looking for the self, that's where we find it. But I think from the Buddha's perspective, more accurately, this is where we find view: "This is myself." Craving and conceit, however, manifest at more basic levels beneath the narrative. In a sense, they fuel the narrative. But with view, the whole movement bursts up above the surface and becomes a coherent kind of story.

Someone asked whether, given Daniel Dennett's deep understanding of apparently no self, he would be enlightened. No, he's thinking about all this. He's got intellectual insight. He's also a committed materialist who clings ferociously to that view. There's another philosopher—I think Australian—who talks about the hard problem of consciousness. He talks about the two problems of consciousness, one hard and one easy. The easy problems are the sorts of problems that Daniel Dennett works on, like how does the mind work? How does it function? But the hard problem is essentially: what's the nature of the one who is aware of all this? I heard Dennett being interviewed about this fellow, and Dennett was just scathing, dumping on him. You could sense the outrage: "How dare you even go there? We've got to be scientific here, and therefore materialist."

But self-view is all about meaning. When I create a self, I create meaning. This is who I am.

This is what the world is. This is what it all means. In creating a self, I've created what all of this means. But I can't do that without some kind of story. The meaning is really important, and the stories that I tell myself that explain what this means are actually more real to me than the physical world that I inhabit.

An example I like to give is the activity of hanging out the clothes. Have you ever hung out the clothes? Let's say you're watching somebody hanging up clothes on the line over there. You're watching this and thinking to yourself, what is that person doing? Well, the answer is pretty obvious—they're hanging up the clothes. But if you were inside that person, if you were that person hanging up the clothes, and let's say you were not impeccably mindful (which of course all of you would be), then the activity would actually be thinking. The hanging out of the clothes would be on automatic pilot. The real activity would be creating a reality by telling a story to oneself. And that story would be more real and much more interesting than hanging out the clothes. The story would be what is actually happening from inside—the experience.

So the routine physical activity doesn't grab the attention. Why doesn't routine physical activity grab attention? Why is it so hard to stay with it? I think it's because its narrative power is weak, and therefore its capacity to give meaning is weak. Even if the direct, sensate feeling aspect is strong, its narrative power is weak. And we head towards the narrative power because that's where we find meaning. And in meaning we have a self—me—within a world—this world—of which you may not have noticed I am the centre.

So this is the self in the Buddha's teaching: this process of construction. Now you notice also what strikes in this—in each case it's "this is mine, I am this, this is myself." Very specific. This is mine. I am this. Very definite, very specific.

The Buddha is not saying that there's no self. Often people think that he is. People think that he's putting forth some kind of philosophical, ontological statement saying there is no such thing as a self. He doesn't say that. He says this is not self. He's not saying there is no self. He's saying this is not self. That's all. He's not making a grand philosophical statement. He's making a perfectly straightforward empirical statement: this is not self.

And when we construct a self, what we're doing is zeroing in on something specific. This is mine. This. I am this. This is myself.

So have you had the experience, for example, of sitting in the hall, perfectly still, perfect posture, completely absorbed in some narcissistic fantasy in which you're considering what a marvellous meditator you are? That you finally got it worked out. It's taken years, a lot of struggle, a lot of pain, a lot of difficulty, but now I've got it. I've arrived. I can afford now to feel compassionate for all these other jokers.

They try their best.

And then at some point you realize that you've been spending the last fifteen minutes in this self-congratulatory orgy because of a fleeting experience of samādhi that happened about fifteen minutes ago, and suddenly the story changes. *Oh God, I'm pathetic. I can't do this. It's impossible. I'm a terrible meditator. I'm probably the worst meditator in this room. Everybody else is doing well, but I'm doing really badly.*

And you notice that, well, first of all, the two stories can't both be true. They could both be false, but they cannot both be true. And yet, while we're in that one, *this* is me, and *this* is my world. And then, boom—no, *this* is me, and *this* is my world. And the identities completely clash with each other, but we don't even notice that. *This is mine. I am this.* No, no, no—*I'm this.* Now, come to think of it, *I'm this.* Now, I think I was wrong there, actually. Now that I'm enlightened, I realize *I'm this.*

So the Buddha, when he's talking about self, he's not talking about any kind of being or entity that either exists or doesn't exist. He's talking about a process—a process of constructing someone. And a process exists. It could be that dependent arising exists. This is one reason why becoming sensitive to the thought stream is so useful, because the thought stream represents a basic way in which we create a sense of self. Being sensitive to it and tracking it is extremely useful.

Now, the fact that we create a self through our narratives, through our thought stream, is not a problem. It's just part of nature. We're designed to do that. It's just how we are designed. Our problem is that our creation is an expression of our delusion, and as a result it ends up with suffering, with dukkha. We create ourselves, but because of our delusion and our drivenness, we end up with a poor product.

Our normal relationship to narratives keeps us locked into a very superficial dream world. When we look at the mind and how the mind behaves, we see that we create this dream world, and it's driven by these drifting desires and aversions which are constantly changing. Any real in-depth contact with reality is blocked by these dreams that keep swirling around, and we keep holding on. The mind works with all experience coming through all six senses—especially the mind itself—to create some stable reference point which is *me*.

What the mind does in particular is give a narrative unity. It gives us a stable point of reference for me and my world. *I know what it is. I know who I am. I know what this is.* And yet the stability of this is always threatened by change. And when I actually look at it, it's never anything more than a complex web of concepts and feelings, all swirling around, conditioning each other and chasing each other. But this is the self and world that we take to be real.

So we create a self which is real, but it's real only as a construct of the mind. It has no reality other than that. It's basically an organized network of concepts and associated feelings—a very complex, organized network. But we're convinced that there's more to it than that. We believe that the self creates concepts, and that our concepts point towards the self. For example, I believe that my fantasies of the future point to what will happen to me and what will be the world in which this happens. Yet when we look for who's creating these concepts, we can't find anyone. Or take it the other way—if we look for the person for whom these concepts are created. For example, I'm doing walking meditation, and I find my mind is creating a story, and it might occur to me to ask: who's the audience? Who's the intended audience of this story?

Who is this for? And again, I can't find anybody.

So we're convinced that there's someone here. This is the most fundamental reality of my life—that there's someone here. But this self which is so real, which seems so important that it dominates the way I live, is so ephemeral that I cannot pin it down in any experience. And the more I try to pin it down, the more I can't find it, which is very odd. It seems completely contradictory.

So if we can't pin down the self in our experience, then what is it? In the next talk we'll move on with the discourse and talk about the practice of not-self. But if you want to play with this beforehand, see if you can find the one who's creating the concepts. See if you can find the audience for whom the narrative is being told, and see what you come up with.

The Buddha is suggesting that you won't find anyone. Now, notice he's not making a philosophical statement that there is no one there. He's just basically, at most, placing a bet that if you look, you won't find one. And he's doing this because he looked and he couldn't find one. So he's suggesting, well, why don't you look and see if you can find one? The meditation practice is a way of looking. So is there one? Can I find one? Keep looking—it's quite an interesting project.

A participant shared: "I've been contemplating something about Buddha, Dhamma, and Sangha. I was reading Amitāyus, and he was talking about how when we take refuge in the Buddha, we're really taking refuge in our own Buddha nature, our own awareness, because the Buddha historically died 2,500 or 2,600 years ago. You can't take refuge in a being."

"You mean he didn't rise again?" I asked. "Sorry?" "He didn't rise again from the dead? Or am I getting that mixed up with something else?"

She continued: "Anyway, basically we take refuge in the quality of awakening within ourselves. And he said that ultimate subjectivity is the Buddha, and the Dharma is ultimate objectivity. I wonder about the difference between subjectivity and that sense of 'I am' that you're talking about. We feel like there's a subjective sense of something happening to us. But did the Buddha have subjectivity? He would have had a sense of subjectivity, wouldn't he? But he wouldn't have confused it with being who he was. He wouldn't have had that conceit—he wouldn't have had māna. What do you think about the sense of subjectivity and the difference between that and the sense of 'I am'?"

To me, the sense of "I am" is like cling wrap. It prevents me from being completely intimate with the experience. It's always associated with a sense of being one step back, not fully there. But there are moments, aren't there, where that's not there? We have that. And in that moment, I'm not thinking, "Oh gosh, this is me having this experience." There are times when we're just completely with the experience, so intimate there's no sense of any audience. So there's no self in that moment. And that's realization of not-self.

Sometimes what happens then is fear arises. Now, as soon as the fear arises, it means suddenly there's someone back here to whom this is happening—someone who's getting scared.

One time I was quite interested in this sense of the dropping away of the self. During one retreat I was working on it through meaning. If there's meaning, there's an audience who appreciates the meaning. Can I have an experience that doesn't mean anything? I was very interested in that. At times everything would drop away and there was just that intimacy. But I wanted to check something about the body, because I was interested in the body. I wondered, what is the body like when the mind recognizes this? And I kind of programmed myself to check that when it happens.

One night it happened. I was doing walking meditation on this veranda, and as soon as I noticed it, I immediately started stretching. I noticed that I could stretch further than I could a moment before. The body had just let go of a massive amount of tension. And then the thought arose in my mind, "I wonder how long this will last." And it was over. The body was back to its normal state.

It's quite interesting that even the body is changed.

But these glimpses come and go, and part of the whole process is allowing the glimpses to happen and noticing that they are there—because they're very subtle. It's largely an absence you're noticing. And then learning to become comfortable within that, and therefore extending them.

This is what the tradition calls *tadaṅga nibbāna*—nibbāna in its specific aspect of just walking, or just singing, or whatever. The English Romantics, Coleridge and Wordsworth, were into that same thing in their search for the sublime. That's exactly what they were interested in—that same feeling. It comes across in a lot of the Zen literature as well.

Thomas Metzinger, who's a philosopher of cognitive science I've been following, has a nice analogy related to what we've been exploring—where the selfing process is both the object and the subject. He uses the analogy of the selfing process giving us a user interface: a sense of a constant now, always happening in the present, a feeling of position. So it gives you a user interface to your external world. But even more profoundly, it gives you an avatar that can move around in this world. You're actually trapped in the idea that it is *you* moving around in this space.

He has some clever experiments where a person connected to an MRI in Tel Aviv is moving a robot in London. He's extended the sense of proprioception through computer science—the MRI extending from Tel Aviv to London. So the six senses that we've been talking about are extended across continents. It's a very interesting idea. His view is that we're in a cognitive arms race all the way through, from slime right through to where we are now. The organisms that could emulate themselves in the world best survived at an evolutionary level. We're really a product of that whole process.

Someone asked: "Can not-self only be recognized a nanosecond after it's happened? Because if you're completely intimate with an experience, it's not until you realize, 'Oh, I'm completely intimate with the experience,' that you know it."

Well, once you name it, something has shifted. At the time, one couldn't recognize it in the sense of saying what it is. So it's just happening. I think awe is wordless, isn't it? When you get to the top of the hill and see the tree up above against the sky—it's an awe-type wordless feeling. Basically it's just whatever is happening. But it's not *about* whatever is happening. There is no "about." It's just what's happening.

We've come back to *tathatā*, to suchness, just thisness. I think the constraining assumption is that something can only be experienced through the verbal storyline. But when the verbal storyline drops away, the suchness is still known, still experienced. When the self and the storyline drop away, that experience is known in and of itself, just in a non-verbal, non-conceptual manner—a bit like how we walk. Walking is a non-verbal experience, but it's still known. How to walk is known.

And I think over the years you get used to it, and that's fine. So the more often the self falls away, the more you get used to it—the more you get used to that non-verbal experience of being intimate with the present moment, not having to have a bunch of words to tell yourself the story of being intimate with the moment. It's still known, though. But as soon as you're telling yourself the story, then what you know is the story. You've just separated out.

Anyway, that's enough for tonight. Thank you very much.

CHAPTER 23

The Not-Self Characteristic - Part 2

Patrick Kearney · 58 min

In this second part of his examination of the Anattalakkhaṇa Sutta (SN 22.59), Patrick Kearney explores how the self is actively constructed through three movements: taṇhā (craving), māna (conceit), and diṭṭhi (view). He illustrates how modern advertising exploits these patterns, selling identities rather than products. The talk delves into the Buddha's systematic deconstruction practice of applying "This is not mine, I am not this, this is not myself" to all experiences across time, space, and quality.

Kearney explains how this cognitive wisdom practice leads to nibbidā (disenchantment) - a profound "finding out" that transforms both understanding and the heart. Through intimate examples from meditation practice, he shows how practitioners recognize the painful drivenness of self-construction and naturally move toward letting go. The discussion covers the gradual fading of obsession (virāga) and the sudden shock of liberation (vimutti), emphasizing that awakening always appears accidental though practice creates the conditions. The talk concludes with the profound silence that follows the complete abandonment of māna (the conceit "I am"), where all positions and dualities cease, leaving only action without an actor.

The other night we looked at the opening section of the Anattalakkhana Sutta, the discourse on the not-self characteristic. This is regarded as the second formal teaching of the Buddha, taught after a meditation retreat in which the five companions, now the five bhikkhus, had all attained to the first stage of awakening. He teaches this discourse to take them all the way to full enlightenment.

We covered the first section where the Buddha discusses the nature of self, particularly that self is something that is constructed. It's a project. It's not a thing and it's not a someone. The Buddha goes through the five aggregates with the same argument: "What do you think? Is body permanent or impermanent?" "Impermanent, Bhante." "And that which is impermanent, is it painful or pleasurable? Is it dukkha or sukha?" "Dukkha, Bhante." "And that which is dukkha and subject to change, is it appropriate to regard it in terms of 'this is mine, I am this, this is myself'?" And they say, "Certainly not, Bhante"—which you will be pleased to know is the correct answer. Think of what would have happened if they had said, "Yeah, sounds fair to me." The whole history of Buddhism could have come to a grinding halt.

There are three movements that construct the self: craving, conceit, and view—tanha, mana, and ditthi. Tanha literally means thirst; essentially it's drivenness. Here it's the urge to possess, and in this context this urge to possess has power because I find my reality in my possessions. So as the owner of this, I am. I am the one who owns this. What we possess reflects back on us as the owner, and if the possession is real, well the owner has to be real. This is of course the basic principle in advertising, where what's being sold often is an image of oneself. If I get this or that product, then I become this or that person.

I'm reminded of my last trip to India. I always fly Singapore Airlines, and they show ads repeatedly whenever you want to watch a movie. There were two ads shown again and again, both apparently about finance or some important international industry.

The first ad was for a Western hotel chain. The hero was this very young, good-looking man, nicely dressed, cruising from hotel to hotel where he would do these incredibly significant business deals that would make him lots of money. In between, he'd be leaping into hotel swimming pools and swimming vigorously. He's cruising the planet, going from hotel to hotel, looking incredibly good and making heaps of money. A couple of times in the ad, as he's walking one way through the lobby, walking the other way is this gorgeous young woman, and their eyes meet significantly. But they pass on, because both have money to make, presumably. The message apparently being conveyed is: if you stay in our hotel, you can be like this person, who represents some kind of ideal. He's global, young, good-looking, and rich. He floats above the rest of the planet.

The other ad was for a bank. There was another young man—not quite as good-looking, but pretty good-looking—working in this bank, in charge of a team. He's sitting in his office looking at his team members, who are all working really hard. He gazes at them with a certain sympathetic compassion, leaps up from his desk, and in the next scene he's handing out coffees to them. They gratefully receive them because their boss is obviously concerned for their welfare. In the final scene, he's signing a deal with an older man at the airport where the older man has his private jet. He's just made some incredible deal, helping the older man advance his fortune. Beside the older man is his son, gazing upon this whole sacred event, the signing of the contract. They disappear, and the young banker gazes after them with this benevolent smile on his face.

Again, you get this ideal. Both are variations of the contemporary capitalist ideal. What I found interesting was the two souls being portrayed. Each one was meant to be incredibly attractive. The Western one was utterly alone, totally alienated from every other human being on the planet, just passing through. This was apparently supposed to be really attractive. To me, he looked like a hungry ghost. At least the Chinese banker

was connected. He had people in his office who were like his family and he was looking after them. His client, who he was looking after, was definitely family, so he was connected to human families, interconnections, society.

So he was still completely driven by greed, but his self was much more grounded than the self of the Western figure. I found the Chinese one much more attractive than the Western one. But they're both selling selves. Both advertisements are doing exactly that—if you go for that self, maybe you'll buy that product, subconsciously becoming, at least in one's imagination, that person.

So you have the urge to possess. Then māna, which we said is measuring, and this is the sense of separation and identification. I measure something out, then I fix its borders, and I've turned the universe into two. There's this here and that there. Self, other, this, that. This is the fundamental sense of separation that is at the root of the self. I'm the one in here. You all are the ones out there.

And finally, view—diṭṭhi. This is the narrative, often comes out as the narrative of myself. The story that I tell myself, the stories that I tell myself that define me and define the world that I live in.

So the self is a project. It's something that we're doing. This is mine. I am this. This is myself. And it's always—again we mentioned last time—it's always specific for the Buddha. Like this is mine. This recorder. These glasses. These clothes, this position, this body, this, this, this, this. The Buddha's not saying that there's this something out there which is a self. He's saying that for each experience that arises, awareness lands on it and seizes it. This—this is my self.

But of course that project can't stop because this, whatever it is, turns into something else. It disappears. So what happens to me? Well, this is my self. But that disappears. So this is my self. So there's this quality of restless drivenness in the construction of a self. This of course is craving. Always there's this sense of, on the one hand, separation and the flip side of that is the sense of all this is happening to someone.

And view is the stories that we weave around this whole process. And out of these movements we create an identity.

So then the Buddha moves on from there. He says, therefore—and again he goes through each of the five aggregates—therefore for any kind of body, whether past, future or present, internal or external, gross or subtle, superior or inferior, near or far, all body should be regarded with penetrating understanding realistically in this way: This is not mine. I am not this. This is not myself.

For any kind of feeling, for any kind of perception, for any kind of construction, for any kind of awareness, past, future or present, internal or external, gross or subtle, superior or inferior, near or far, all awareness should be regarded with penetrating understanding realistically in this way: This is not mine. I am not this. This is not myself.

So here we have the heart of the sutta. And what he's presenting is a practice. Again he's not presenting a doctrine. Self is a practice. It's a construction project. Not-self is a practice. It's taking apart.

It's deconstructing. We become intimate with this whole process of constructing a self and we learn to recognize the clinging inherent in this project, and therefore the pain and the unsatisfactoriness of it, and then we start letting it go.

So a lot of what we're doing when we meditate is actually seeing ourselves construct ourselves. This process begins in the very mundane experience of distraction. Once we become sensitive to the movements of the mind, we realize distraction has a tremendous amount to teach us because often what we're doing in it is busily creating someone. We're basically creating someone who's far away from here having a good time. Or, more frustratingly, we create someone who's far away from here having a bad time, having a worse time than the one who's actually sitting here. But we find this attractive because we keep doing it. There's something attractive about this self.

There's something attractive about being miserable. It gives a sense of certainty, a sense of stability, solidity. "This is me, I'm the most miserable person on the planet. Other people try for the title but they don't get there."

I remember many years ago when I started meditating, what I wanted was a bit of bliss. That's all. I didn't think it was a great deal to desire. I was miserable, I wanted some bliss, and I had read these books and apparently you meditate, you attain deep absorptions and you're blissful. So I thought this sounds fair enough. I started meditating and for some strange reason I never got to the bliss. My body hurt, my mind hurt, my mind was restless, it was a struggle, but I kept slogging away because I thought one day the bliss will come.

As I got to know people who were also doing meditation practice, I discovered, to my horror, that other people were getting the bliss. I remember one time I was going to this meditation retreat and I was being given a lift by this young woman who was also going. We were both quite new in meditation. I was shocked to discover that from the first time this woman sat down and meditated, she went into bliss. I was horrified. It was al-

most like a personal betrayal. But she was horrified to discover that every time I sat down there was just nothing but pain and anguish. We were horrified at each other. Some people have this karma. It's amazing.

I cultivated this whole situation into a particular bizarre form of identity. Years later I'm at Mahasi Centre doing relentless meditation practice week after week, month after month. Every now and again an experience which looked, smelled, tasted and felt suspiciously like bliss would arise. I would note it, secure in the knowledge that this won't last. And sure enough, it didn't. Then every now and again an experience would arise which looked, smelled, tasted and felt suspiciously like misery, pain and anguish and I thought, this will stick around. And it did. All of it showed my depth of understanding of the human citta until finally it dawned on me that I was making it happen.

My determination to identify with the misery was feeding it and extending it, and my determined belief that anything pleasant wasn't going to last because it wasn't me, it wasn't for me, it wasn't my possession, of course encouraged it to disappear. My identification completely influenced the whole experience that I was undergoing. But what I found the weirdest of all was my determination to identify with pain. Where did that come from? But I was constructing, I had constructed an identity out of it. And the thing is, I was familiar with it. It was comfortable. I knew who I was. I knew what was going on. I could understand the whole process.

The self is deeply attractive, even when it's painful. The job that we have is to deconstruct it.

And this is what the Buddha was talking about when he offers this formula: this is not mine, I am not this, this is not myself. The "not" is the center of this discourse. Essentially, what it's about is not-self, and the "not" starts to cut through what we take to be real, what we assume is real and me.

Notice that the Buddha, in his usual thorough way, tells us exactly what kind of experience should be subjected to this examination. What is it that we should look at in terms of "not mine," "not this," "not myself"? It's any kind of experience—past, future or present, internal or external, gross or subtle, superior or inferior, near or far.

This covers a lot, obviously, but basically it's any experience that can be characterized by location in space, in time, or in quality. Internal, external, near or far—these are categories based on space: Where is it? Past, future, or present—this is based on time. Gross, subtle, superior, inferior—these are qualities. So any experience that can be characterized by being located in either space or time or quality is covered by this discourse.

This boils down to any experience subject to māna, to conceit. Because it's conceit that creates the fundamental sense of separation that enables an experience to be experienced as "this" rather than "that." It's māna which enables an event to be experienced as here rather than there, past rather than future, and so on—as important rather than trivial, or trivial rather than important.

These categories create meaning and significance. Every experience that provides me with some kind of meaning, some kind of significance, is raw material for creating a self. What this practice is all about is just tearing all that apart, deconstructing it, knocking it back: not, not, not. This is a very radical teaching. It's designed to cut away everything.

The Buddha goes on: "Seeing in this way, the trained, cultivated student is disenchanted with body, disenchanted with feeling, disenchanted with perception, disenchanted with constructions, disenchanted with consciousness. With disenchantment, obsession fades, and from the fading of obsession comes liberation. With liberation comes the understanding of liberation, along with the knowledge: birth is exhausted, the highest life is fulfilled, what should be done is done, there is no more this." This describes the practice all the way to full awakening.

The practice of not-self is essentially cognitive. It's a wisdom practice, all about seeing and understanding. We investigate, we see what we normally don't look at because we take it for granted as obvious. In practice, as the practice develops, one of the challenges is that we are becoming increasingly intimate with the experience and going deeper and deeper into the citta. Things are becoming more subtle and more refined, and therefore they can be difficult to actually pinpoint. But also we're getting deeper into what we normally never see because we simply assume it. We take it for granted. It's so obvious we don't pay it any attention.

If I'm disturbed, for example—today I'm disturbed, today's a difficult day, I'm quite disturbed—here are the symptoms: boom, boom, boom, boom. This is what I'm thinking about it. These are the conclusions that I've drawn. That seems to be what's important. That's what's going on. But what we don't see, because it's so obvious, is that all of this is the product of the citta in a certain state—a certain sensitive, vulnerable, painful, disturbed state.

We don't actually examine that state, partly because it's so subtle that it's not immediately obvious, and it's not immediately obvious largely because we take it for granted: well, this is me, I am disturbed. So what's important when I am disturbed is my disturbance. That's where all the attention goes. This is what I want you to fix. I'm disturbed. Can't you do something about it?

So all of this is coming out of the self and it assumes the reality of the self and the world created by the self. But the practitioner's job is to recognize: ah, there's disturbance, then what's in here, what's happening in the citta, deep down, that's creating, that's feeding this sense of disturbance? And what that is actually has nothing to do with me. It's something much more elemental.

We emphasized in the beginning of the retreat the relationship to body. We talked about the elements. We practiced the elements. So there's hardness, softness, movement, hot, cold, and so forth. When we examine the experience of the body, it resolves into these elements. Now the thing about these elements is that none of them are me. I am not the hardness. I am not the softness. I am not the movement. So even then we're breaking apart the project of the self.

But as we go deeper into the citta this becomes more and more evident. And again, it's often through what we would normally call distraction, what we would normally dismiss as not worthy of our concern because I'm busy with my meditation and so the distraction is just trying to get in the way—it's that which actually reveals the project.

So the practice of not-self is cognitive, but the result is affective. The heart is transformed. The heart calms with the fading of obsession, and with that liberation becomes possible. So the Buddha presents first the cognitive: see what's going on in order to gain an entry into the heart, into the citta, so that the realm of what we've talked about as vedanā can start to transform. But that's the deeper realm and it's actually more difficult to get to and to transform.

And the turning point is nibbidā, disenchantment. So we're going to have a look at this term. Nibbidā comes from the root vid, to experience, to find, and the prefix nir, which means out. So nibbidā is a finding out, it's a discovery of something.

Enchantment always implies delusion. When we are enchanted by something, we are intoxicated by it. This happens only when we don't fully understand it. So we are enchanted with something, for example, when we feel that if only I get this, then all my problems will be solved. If only I do that, then I'll be okay.

So it might be a job. If only I get the job that I've always wanted, then everything will be all right. It might be the appropriate partner. If only I get him or her, then everything will be all right. It might be the latest computer or whatever. It can be anything from the most trivial to the most significant. But the basic relationship is: if I can only get this, then everything will be all right.

So this is enchantment. And it's based on delusion because in fact when we get whatever we get, it doesn't solve all the problems. Whatever it is turns out to be impermanent, unsatisfactory, and not-self. So it's just part of this endless cycle.

So the experience of nibbidā, of disenchantment, reveals the disappointment in our expectations. Ultimately, compared to what I wanted, I find myself disappointed. So nibbidā, or disenchantment, is a finding out. It also implies an experiencing out, a moving out, away from our normal way of experiencing something to something quite new.

So we think something is going on, but we're wrong. And then at some point we suddenly realize: no, something else is going on. I've been completely mistaken about this all this time. Now I can see something else is going on.

It might be, for example, we're having problems with someone because this particular someone is a complete total bastard—not to put too fine a point on it—because they've done something which is totally unacceptable and they could have no motive other than the desire to cause me personally great distress. Otherwise they wouldn't have done this. What other possible motive would there be?

But then we might find out that what we thought was going on was not, that something completely different is going on and that we had no idea what this person's situation actually was. We had no idea what their motivations were or what they were trying to accomplish. And suddenly we realize this and the experience is: oh, that's what's happening. And immediately all that aversion and distress and so on—it's gone.

Because we can see that something else is going on. So the whole relationship changes. Nibbida, disenchantment, has this quality as well. We realize something else is going on, and then our whole relationship to it changes.

Some classical examples of nibbida: when Siddhartha was a young man and he had his famous experience when he realized the universality of aging, sickness, and death. So he's living his life and there's a certain reality that he takes for granted—his own reality, that of his family and that of his people. And suddenly, bang! He sees differently and everything has changed. The whole world within which he has lived disappears and he's in another world and he needs to be doing something completely different. This is nibbida, this is disenchantment. And in his case, that experience set him off on the search for awakening.

Then the second classic example, again with Siddhartha: his disillusionment with asceticism. Remember we talked about that. One day he realized this is a complete waste of time. This doesn't work. And again it would have been this profound shift, this moving out, finding out, where he suddenly realized that everything he took for granted in

terms of his whole spiritual identity—the great ascetic, champion ascetic—and it's clear from what he was telling his students years later that he really had built up his identity as the champion ascetic of all time. And he suddenly realized the whole thing is a crock. It doesn't work, and he's in this completely different world. And like the first time, he doesn't know what to do about it. All the rules have suddenly changed and he has to work out what he's doing within this new world. And so that propelled him off to the Bodhi tree and awakening.

So nibbida, disenchantment, has this quality. And it can be quite powerful, as in these two examples, but it can be very, very subtle as well. But it's both cognitive and affective. It's both head and heart.

So in terms of the heart, the affective, the heart is moved to say, "Enough." And this happens through cultivating an intimacy with the experience. People who are oppressed by particular obsessions, for example, when they meditate, sometimes it can become very distressing because it just goes on and on and on and on and on. And when will it end? And the answer simply is: it will end when we've had enough. It's that simple. Once I've had enough, I will stop. But until I've had enough, I'll keep going.

But how do I reach this point where the heart—not the head, but the heart—knows that's enough? It comes through this intimacy of experience with it. So not being separated from it by constructing yourself out of it, but again by this developing intimacy into the heart, into the citta, going deeper and deeper and deeper and deeper into it. And when we're intimate with it, then that move naturally occurs. At one point we realize that's enough. And at that point it simply stops. And sometimes that is very sudden.

So people report, for example, they have a particular obsession that arises in the mind. And sometimes a meditator will come into an interview kind of a bit spaced out because they've been harassed by this obsession for years, and they'll report: "It arose, I recognized it, and I just thought, 'No.' And it stopped. And I haven't seen it since."

And this is nibbida. This is disenchantment.

"Could that be applied to drugs and alcohol?"

Yeah. It's the same process. It's like, when do people stop? It's literally when they've had enough. Actually, there's one Sydney barrister, the guy who created the series about the... Rake? Rake, yeah. He's got a column in Fairfax. And in one of his columns he said, "I wish somebody had told me when I was young that the human body can only consume so much alcohol in one lifetime. Because if I had known, I would have paced myself. But as it is, by the time I was forty, I had already consumed it."

So that was nibbida. What he was describing was nibbida. It's like at forty he suddenly realized, "Oh, I've had enough now."

And at that point he stopped. And it's a completely natural development. That kind of insight lasts. He'll stay sober. If the disenchantment is deep enough, then he won't go back. There's no need to go back. Been there, done that. This is an expression of nibbida, of disenchantment.

So nibbida is affective—the heart is moved to say enough. It's also cognitive—a finding out, an understanding that arises through that response. Now I can see what's been going on. Now I understand it. It's affective because the heart changes. What previously seemed desirable now is not. I just don't want that anymore. Other things become desirable, and these are what I pursue. The heart changes.

One of the transitions that practitioners go through is when old pleasures drop away but new ones haven't yet taken their place. A kind of affective confusion can arise. I remember once when I was in Hawaii, one of my Zen friends who was a very interesting character—if you wanted a typical example of the Zen personality, or one particular kind of Zen personality, it was him. He embodied this total directness and almost fierceness of engagement with whatever was happening.

We were walking down this country road in Maui one day when he suddenly stopped. A look of complete confusion and bewilderment came over his face—totally uncharacteristic. I stopped and asked, "What's the matter? What's the problem?" And he said, "Suddenly I realize I don't know what I want." It really hit him.

It can be quite a profound experience when you actually realize that. Our whole life is geared around what we want. But what if we suddenly realize, "I don't know what I want"? Who am I then? Where do I go? Sometimes we find that what we used to want, what used to be pleasurable, is gone. Maybe we're not quite sure about what's replacing it.

When one set of desires drops away, along with it could well drop away a whole social network. Friends call asking, "Why don't you want to come out? You haven't come out with us for months. What's the problem?" Well, I just don't want to. And then the social network is gone. The person is left wondering, "Where is my social network? I haven't actually found other people who want what I want."

The heart changes, desire changes, and with it the world within which we live. When our heart is changed, the world that we live in is different. And this, again, is cognitive. The world is different. What previously was hidden is now obvious. What previously we could never have seen is now as clear as day.

This disenchantment has this transformative, turning-around effect. And again, with this discourse, if you read it superficially, you might get the impression that disenchantment happens just once. But it happens again and again at different levels.

One way of looking at it is as a process of simple maturity. I used to challenge my audiences by asking: "How many of you today follow or chase the same desires that you had when you were ten?" They've all changed now. We're all chasing different things because we've matured. What was desirable when we were ten is no longer desirable today.

There was one Englishman in the audience who immediately objected and said, "Except football." So maybe that's the exception to the Buddha's teaching—there's always an exception to something.

The Buddha says that with disenchantment, obsession fades. And from the fading of obsession comes liberation. This fading of obsession is *virāga*, which we've already discussed. *Rāga*, usually translated as lust or passion, literally means color. *Virāga* is literally the fading of color.

The image is of a dyed cloth. When you wash it, it looks the same. You wash it again—it looks the same. You wash it, wash it, wash it, and at some point you look at it and realize it's not the same anymore. It's faded. Then it progressively fades further. This is the fading of obsession.

Again, what we're talking about is a natural process of maturity. We're not so driven; we have some distance that we didn't have before. And it comes about gradually. Part of the gradual aspect is that we don't notice the step-by-step progression.

This is especially true when we're doing meditation—it's like we're at the coalface, looking at the details and specifics. It's a very in-your-face kind of relationship, which is characteristic of mindfulness. And we don't notice the changes happening because they're so slight day by day. It's like we don't notice ourselves growing up. We don't notice ourselves getting old until something happens—"Oh, I used to be able to do this but I can't do it now." We don't notice how that happens step by step by step.

It's the same with the fading of obsession. We don't notice every step of the way, but there are points when we realize, "Oh, things are different now. My relationship to the world is different from what it used to be. My relationship to others, to myself, has changed. It's different now." So this is a gradual process.

With disenchantment, obsession fades, and from the fading of obsession comes liberation. Liberation is *vimutti* in Pali or *vimokṣa* in Sanskrit. *Vimutti* comes from the verb *muñcati*—to release—and it's the same verb used in archery. If you imagine firing a bow, we pull it back to its maximum tension and then release. The arrow is released and goes away very suddenly.

So liberation has this implication of suddenness—a sudden shock of awareness. It's like suddenly, "It's different. I've never seen this before. This is new." We suddenly know something quite new. And again, it's unexpected. It always appears as if by accident.

My old Zen teacher, Robert Aitken Roshi, used to say that awakening always comes about by accident. The practice makes us accident-prone—and that's the causal relationship. Nothing that we do in the practice causes liberation, but it sets up the conditions in which the accident might occur. And of course the Zen stories are full of these accidents. They really like these accidents.

And unless you know the backstory, you get the impression that awakening just falls from heaven. But of course it doesn't just fall from heaven. It comes about through years of preparing the conditions.

So liberation implies this sudden shock. Again, it can be gross or very, very subtle. Suddenly something is new, perhaps undefinable, perhaps we can't even pinpoint what it is. But it's no longer normality. Something has changed.

With liberation comes the understanding of liberation. And here, I think this kind of move is typical of the Buddha. Liberation could be seen as affective, but also cognitive. But understanding definitely implies a reflexive distance and looking back on the situation. We know ourselves and we know ourselves to be different, so we have a sense of what happened or the significance of what happened.

We've been talking about this before in terms of the meaning of an experience. Something happens, and then we get a sense of what this means. So I might recognize, I might read the experience in some way: "Oh, I've just seen impermanence, or I've seen dukkha, or I've seen not-self." Now what we're doing is putting a meaning on the experience. And with that meaning comes a sense of, well, this is who I am, and this is the world.

So in a sense, we're creating a new self. But it's a different self. And it's a self held differently than before. But it's the meaning that gives the experience significance and therefore changes the way that we live.

So with liberation comes the understanding of liberation, along with the knowledge: "Birth is exhausted, the highest life is fulfilled, what should be done is done, there is no more of this."

Now this is—in a linear sense, this passage will be read as full awakening. In a non-linear sense, this is more like the experience of emptiness that can occur a number of times. But each time that it occurs, it has this quality of "there is no more of this." And the "this" indicates the place where we ground ourselves—the final layer of concept that tells us who we are and what this means.

So the "this" here indicates the "I am this." It's what the awareness lands upon to create something and someone out of. And it's taken away. There is no more "this." Pull out the rug. And there's nothing.

We've looked at the self as a process. The self is a project. A project never completed. So we define ourselves through story, and our story is never completed. It's never finished. How many people here have actually completed the last chapter? Or is there another one that's going to come? It's always another one that's going to come. There's always another episode in the drama of our lives.

And so part of the meaning of this experience right now is always the fact that it's the prelude to something else which is going to come next. And this is why death is such a challenge to the self. Because death represents a sudden cutting off of the story. Suddenly, chop—story's cut.

And it always arrives as a cheat. It's like following a TV drama which you're really invested in, and they suddenly stop it before the end. There are definitely several more episodes, at least, that could be squeezed out of this. And then suddenly it's all over. And you can't help but feel cheated before everything's wrapped up.

And death is like this. So we may be ready to die, but never today. Because we haven't wrapped up the loose ends yet. There's another episode that has to come first. But the final episode never does arrive. And so when it comes to an end, it's always a shock and it's always a cheat.

Have you seen people ready for death?

Like those who have come to a point of peace. They've been sick for a long time perhaps, and they are actually quite ready. I'm talking about the normal human condition rather than someone who's been practicing and preparing for it.

And this is the power of the "no more" - na param. In terms of the practice, in terms of realization, right now already in the middle of the drama where one day succeeds another, there is no more. This is the realization that there really is no next. That this is all that there is and this is all that there ever has been or ever will be. There never has been any past and there never has been any future.

This understanding can happen now. In fact, it can only happen right now. And when it happens, it's bleeding obvious that nothing is going to happen next because there is no next. Nothing ever did happen because there's no past.

The understanding of anatta always arrives with a sense of completion, that there's nothing further needed. There's nothing extra that has to be added. There's no possibility of anything extra. And this is the abandonment of the conceit "I am" - the abandonment of asmi mana.

Again, mana is measurement and comparison. Past and future depend on mana, because past and future can only exist when they're measured against the present. The present can only exist when it is measured against past and future. I can only exist measured against you, and you can only exist measured against me. Good can only exist measured against bad, and bad can only exist measured against good.

But when mana drops away, all positions cease. They're just gone. No past, no present, and no future. No duality. Mana is all about duality. The cessation of mana is all about non-duality. Duality and non-duality are terms that entered later, but the Buddha's talking about the same thing.

This is why the Anattalakkhana Sutta ends with silence. "This is not mine. I am not this. This is not my soul." The "not" is the most we can say, and even this is too much. As soon as we reach out and say, "this is what it is," then we're back in mana, in conceit, because "this" can only exist measured against "that." As soon as we move in to make something out of the experience, we're back in mana, we're back in conceit.

All we have is silence, or at least that's the culminating point of this discourse. It's not a passive silence. It's action in the world but without an actor. It's movement but without someone who moves. It's life but without someone who is living. A path without anybody walking it. But at that point, there is nothing to be said about it. Even "not" is too much.

"This is what the Blessed One said, and the group of five bhikkhus rejoiced in the Blessed One's words. And as he spoke, the hearts of the group of five bhikkhus were fully liberated from the taints. Then there were six arahants in the world."

Arahant - fully awakened. Now there are six people fully awakened: the Buddha and the five bhikkhus. The Dharma wheel is turning and Buddhism is taking shape. There's now a community of awakened ones that exists.

Then there were six Arahants in the world—the Buddha and the five bhikkhus, all fully awakened. The Dharma wheel was turning, and Buddhism was taking shape. There was now a community of awakened ones in existence.

The transformation was complete. What had begun with the Buddha's solitary awakening under the Bodhi tree had blossomed into a sangha of realized beings. The first disciples had received the teaching, practiced with dedication, and attained the same liberation their teacher had found. The three jewels—Buddha, Dharma, and Sangha—were now established in the world.

This marks a pivotal moment in Buddhist history. No longer was the Buddha walking alone with his realization. The teaching had been transmitted, understood, and embodied by others. The possibility of awakening was proven not to be unique to one extraordinary individual, but accessible to sincere practitioners who followed the path with right effort and understanding.

From this humble beginning—one teacher and five students gathered in a deer park—the Dharma would spread across continents and through millennia, offering countless beings the same possibility of liberation that these first six awakened ones had realized.

Thank you for listening.

CHAPTER 24

Anattā & the Problem of Life-After-Life

Patrick Kearney · 1h22

> *In this dharma talk from a month-long retreat, Patrick Kearney examines one of Buddhism's most misunderstood doctrines: life-after-life (rebirth). Through careful analysis of the Anattalakkhana Sutta and the Buddha's three knowledges on the night of his awakening, Kearney demonstrates how our conventional understanding of rebirth—based on the assumption that 'someone' dies and is reborn—fundamentally misses the Buddha's actual teaching.*
>
> *The talk centers on māna (measuring/conceit), the deepest form of self-making that creates our sense of separation and identity. Kearney explains how the Buddha's teaching on paṭicca-samuppāda (dependent arising) reveals that what we take to be 'beings' are actually temporary patterns arising from networks of cause and effect (karma-vipāka). The Buddha tracks not the journey of individual beings through lifetimes, but the flowing trajectories of action and consequence.*
>
> *Drawing from the Mahātaṇhāsaṅkhaya Sutta (MN 38), Kearney shows how mature practitioners lose interest in questions like 'Was I in the past?' or 'Will I be in the future?'—recognizing these as expressions of craving and delusion rather than genuine spiritual inquiry. He addresses common Western resistance to rebirth teachings, distinguishing between scientific materialism and dharma as different discourses, and concludes with reflections on how opening our imagination to the Buddha's infinite cosmology can transform our approach to practice and awakening.*

Over the past two nights we looked at the Anatta Lakkhana Sutta, the not-self characteristic, and one issue that has emerged in the interviews is where rebirth or reincarnation fits into all of this. So tonight we're going to examine this question.

The doctrine of what I call life-after-life is very important for the Buddha, yet in our culture it's widely rejected and widely misunderstood. This misunderstanding is part cultural and largely stems from the fact that the whole thing revolves around the issue of not-self, of anattā. So it fits as part of the teaching on this discourse, which is what we're going to explore tonight.

We'll start with māna—usually translated as conceit, though it literally means measuring. We spoke about this earlier: at the surface the self often appears as a series of narratives, but at the bottom of it is māna, which involves measurement and therefore

separation. If I take something and measure it, I establish its boundaries and so separate it from everything else. Māna always implies separation, and along with that comes comparison. If this is separate from that, then how does this stack up against that?

Māna goes very deep in the human mind, according to the Buddha. On the way to full awakening, māna is the last fetter to vanish—the final barrier. When this goes completely, that's full enlightenment. This demonstrates how deep it goes in the mind.

We can get a sense of it, particularly the conceit "I am" (asmi-māna), in our experience of something behind our awareness—something that looks out and is aware. If I'm aware, I'm aware of something, so there's something out there, and then there's the awareness itself. This is the basic dyad we're working with. But I have a sense that there's someone or something behind the awareness—in a sense, the audience of the show.

This something has no content because it's behind awareness. The content of awareness is what we are aware of, which is "out there." But to be aware of something, we have this sense that there's something or someone "back here" to whom this is happening. We could turn around and make that the object of awareness, but whatever we are aware of, still, behind that awareness, we have the sense that there's something or someone there who experiences all this.

So māna is always in the shadows. It has no content. It's not a specific something—just this vague sense. It cannot be pinned down to anything. So māna, "I am," has no content, but it's energized by craving (taṇhā) and searches for content. Awareness goes out, as does desire and aversion, looking for something. So "I am"—but exactly what am I? Exactly who am I?

We're constantly searching for some aspect of experience, something we are aware of that we can hold to ground our sense of separateness, to pin it down as something. "I am this." We can see how the mind searches for something to think about. When we observe how the mind throws up cognitions, there are plenty of them, but there's tremendous energy in the mind that sooner or later will cause awareness to move out, grab one of them, and turn it into a story: "That's who I am, I am this." Or with feelings that come up—some kind of feeling or sensation in the body—bang, "That's me." Awareness grounds itself on that and we construct an identity.

This is what we've been discussing over the past couple of nights, and it's what we're experiencing in our practice all the time.

Now, this whole movement creates a way of relating to the world that revolves around what the Buddha calls extremes (anta). Remember we talked about those in the middle way—the middle way rejects anta, it rejects extremes.

In the case of māna, the two extremes are sameness and difference. As soon as I make that move of separation, this is different from that because there's separation—this is not that. So there's a sense of difference. But to have a sense of difference, there has to be a background sense of sameness, because without a background sense of sameness it doesn't make any sense to talk about difference.

So these two moves that we make—these really fundamental moves—this is different from that, but this is the same as this. We make those moves all the time and construct a world and a self out of them.

If there's identity, if there's something I am—I am this—then there has to be something beyond, something outside of identity: I am not that. These are the basic movements that construct identity: sameness and difference. In terms of the middle way, both of these possibilities are extremes. They're both wrong.

These two movements construct the basic building blocks of identity. I am this, so I'm not that. I'm male, so I'm not female. I'm Patrick, so I'm not young. I'm good, so I'm not bad, and so on.

From the middle way—in other words, outside identity—both these moves are extremes and wrong. But from inside identity, this way of looking at the self and the world makes perfect sense, and it's the only sensible way to look at things. Either this is me or it isn't. If I look into a mirror, what are the choices? It's either me in that mirror or it's somebody else. Either this is mine or it belongs to somebody else. It's not complicated. Either I am Patrick, or I'm somebody else. Either this is right, or it's wrong.

From inside identity, all of that doesn't just make perfect sense—it's obviously the only way things can operate. From outside identity, from the context of the middle way, they're both wrong.

Now, Siddhartha, who became the Buddha, penetrated into all this. Before he became the Buddha, on the night that he sat down under the tree, what happened according to the early texts? There were two accounts of his awakening, and one tells about the three vedas that he went through throughout the night—throughout the three sections of the night.

These are the three knowledges. During the first third of the night he remembered his previous lives. During the second third he saw the falling and arising of other beings in the present. In the third of the night he attained awakening. Let's look at them, but especially the first one.

This is how the first one is described. For each life that he remembers, he says: "There I was so named, of such a clan, with such an appearance, such was my food"—my nutriment, which can be broader than food, everything that sustained life, but especially food—"such my experience of pleasure and pain, such my life term, and passing away from there, I reappeared elsewhere."

He goes back lifetime after lifetime, and this is what he remembers for each one. All of these things that he mentions are identity markers. They constitute what creates a sense of identity within Indian society—how an identity is constructed.

The Bodhisattva is looking back through his memory and recognizing that at one time he held to a particular identity, but before that it was another one, and before that he had another identity, and before that he had another one—and another and another and another. He's doing something that we can do, except that he did it for multiple eons whereas we might only do it for twenty years, fifty years or whatever.

What this is about is that the Bodhisattva recognizes from his personal experience the contingency and the impermanence of identity, and how identity changes over time.

So bringing it more to our level, we could say when I was 10 I was this, when I was 20 I was that, when I was 30 I was something else, and so on. What's happening is his sense of identity is starting to be shaken up. His sense of personal identity is still there, but it's starting to be loosened. This is preparing him for enlightenment.

Then in the second knowledge, the Bodhisattva sees the same contingency of identity flowing from one existence to another—not in the past but in the present. The first knowledge is all about memory. The second extends universally outward, not just within his individual personal memory stream. So it's the same understanding, but going out in the present and universally. Not simply his identity being shaken up because it's impermanent and dependent upon conditions, but everybody's identity is caught up in the same way.

These two knowledges give the same message: identity is not fixed. It's not primary. There's something else going on which is deeper than identity. These knowledges prepared him for awakening, softened him up for the awakening.

If we look at ourselves, we take identity to be primary. For us, that's what's at the bottom. This assumption we have is fundamentally not empirical, because it's not that we can find this identity. The identity is the product of māna. Māna is always in the shadows and we can never pin it down. So we can't actually find this identity.

If you look at what you're doing when you're meditating, a lot of the time what you're doing is failing to find it. You're seeing a process of construction. You're seeing it go very deep. You're seeing it driven by craving. It's incredibly strong. But you're not actually landing on the fixed, permanent identity. So the assumption that there is this identity is not empirical. We assume it. We experience from it—we don't experience it, we experience from it.

But this assumption is what gives death its power, and why we're so preoccupied by death and by what happens afterward. Because with death, we are the ones who die. And with birth, we are the ones who are born. And in fact, that's what makes it interesting.

The Buddha rejects both of these assumptions. For him, identity is not primary. What is primary is paṭiccasamuppāda—dependent arising. Identity, self, emerges as a series of patterns swirling around in the matrix of dependent arising. It's rather like a stream where at the same place, at certain times of year, a whirlpool will appear. Then the conditions change and the whirlpool ceases. But next year, it's back. If we visit that stream, that particular part of the stream, at the same time each year, there it is—the whirlpool. It's been here for years. I used to visit this whirlpool when I was a child, and there it is.

We look at that whirlpool, and for us, identity is primary. That's what it is. But in fact, it isn't. It's just a temporary, contingent result of a complex process which comes and goes.

And what's primary is that process. Does that make sense?

So the Buddha definitely believed in life after life, and if we ask: when the Buddha sees beings move from one existence to another, what is it that he's tracing? What's he tracking? We naturally think what he's tracing is beings. Beings are born, they die, and then they're reborn, and he's following them life after life. We naturally think in that way because for us, identity is primary. We operate from within self.

But for the Buddha, what's primary is dependent arising. He's not tracking beings. What he's tracking are networks of cause and effect over time, and from these networks emerge the perception of beings. And then those perceptions cease. And other

perceptions arise, and they cease, and so on. In other words, he's tracing networks of karma vipaka—action and its ripening. He's not tracing networks of beings. You see the difference?

When the Buddha speaks of life after life, he's not saying "I am born here and then I'm born there and then I'm born over there." We tend to think that's what he's saying. We just assume that's what he's saying. He has to be saying that. But he's not saying that.

Even Buddhist intellectuals who argue against life after life—and the example I always give is Stephen Batchelor, because I was struck very much by his chapter on rebirth in his book Buddhism Without Beliefs. I think it was chapter two where he rejects rebirth, life after life. I read the chapter and I thought, "No, he can't be saying what I think he's saying." So I started at the beginning and read it again. But the more I read it, the more he was saying what I thought he was saying.

People who argue against the doctrine of rebirth are actually arguing against the idea that it's possible for any being to be somehow transported from one body to another. That's what they're arguing against. And so the question is: well, okay, what gets transported? Obviously not the body. So the mind, or some esoteric aspect of the mind. But this esoteric aspect of the mind has to contain all the data required to shape this person's life. And nothing they can do can make this make any sense. It just doesn't hold water. There's no convincing argument. So they reject the doctrine of life after life.

But the problem is that what they're rejecting has got absolutely nothing to do with what the Buddha is teaching. The Buddha is not teaching that beings die and are then reborn. He's not saying that. He's saying that there are flowing patterns of dependent arising. These operate through time and give rise to the appearances that we perceive as beings. And these flows of cause and effect flow through very particular trajectories, based on karma vipaka—action and its ripening.

So it's not that this being becomes that being, becomes this other being. It's this cause leads to that effect, which manifests as this cause leading to that effect, which manifests as this cause leading to that effect, and so on. That's what he's talking about.

The way we think is: we think there are beings, and if we're Buddhists and we're learned and spiritual, then we say, "Ah yes, these beings are caught up in this universal pattern of cause and effect." That's not what the Buddha is teaching. The Buddha is teaching there is a universal matrix of cause and effect, and from this emerges the appearance that we label as beings. It's quite different.

We think in this way because we assume that our fundamental situation is—and let's clear away all the bullshit and just get down to the basics—we think that our fundamental situation is that either I will survive death or I will not survive death. Really, that's it. If we toss out the spiritual mumbo jumbo, this is what we come down to. This is our natural way of relating to this situation.

And of course, if I am the one who survives death, who in some mysterious way is reborn somewhere else, then I'm interested. This is important. If it's somebody else who is reborn, maybe in some abstract cosmological way, I'm not really interested.

I mean, that's a nice kind of doctrine, but I'm not really interested. And if I don't survive death, I'm definitely not interested.

This is our natural way of relating to these questions, and you can see that all of it is based on "me." What happens to me? But the Buddha is not looking at this from inside any sense of me. He's speaking from beyond identity, from outside identity. And there it's a whole different matter.

If we start talking about life after life, then what we want to know about is who lives after death. That's important, isn't it? From the Buddha's perspective, if we ask the question, "Who will leave this hall after the talk?" and we answer that question, we have also answered the question, "Who lives after death?" Because it's the same question from his perspective. It's just a different way of asking exactly the same question. And if you can answer one, you can answer the other.

The Buddha has this sense of an enormous universe within which all of this takes place. He has a variety of terms to talk about what is usually translated as rebirth. One is *upapatti*, going up or reappearance. Another one is *punabhava*, further becoming, renewed existence. And there are other terms as well, but I haven't collected them. Basically what they refer to is the Buddha's sense of the infinite possibilities of existence that are inherent in the universe. Because for him the universe is infinite. Within the infinite universe there are infinite possibilities. And essentially I think this is what he's referring to.

They do not refer to the fate of persons as they travel from one life to the next. They're not talking about that—although of course we think they are. We assume they are.

From inside identity, if there's a new birth, this is either me or it's not me. That's it. But once we step outside of identity, that dichotomy simply does not apply. The question, "Who is reborn?" simply does not apply. It's an irrelevant question. It doesn't grapple with what the Buddha is talking about.

These questions only arise within identity. They make sense only inside identity because they assume the real existence of the "who"—who is the one who dies and is reborn, or not reborn. All of these questions are just variations on the fundamental question of the self, which is, of course, "But what about me?"

From the Buddhist perspective, there can be no answer to these questions because the questions themselves are the products of craving and delusions. Take away the craving and delusion and the questions don't even arise. Whatever answer we come up with to these questions are simply expressions of craving and delusion which in turn feed more craving and delusion. It's just cycling around.

As a local Zen teacher remarked, "You cannot give a straight answer to a crooked question."

For the Buddha, there's only one way in which these questions can be answered satisfactorily, and that comes from the dissolution of the question itself. When the question dissolves, that's the answer. In other words, in this life, the craving and the delusion that drives the question—the obsession with the fate of the self, myself, the self that survives through time—when that obsession drops away, the questions drop away, and that's the answer.

The questions and any answers that we come up with are just fictional narratives. They're just more stories. They're just more blah blah blah. This of course includes answers like, "Of course there's life after life. You cannot be a Buddhist unless you believe in life after life. Unless you think you're going to be reborn, then you can't be a proper Buddhist." That too is just another fictional narrative.

We've been talking about this quite abstractly. Let me give a more concrete example. The example that I always give is based on an event that happened to me years ago after my mother died, having lived in the same house for fifty years. The family had lived there for fifty years. My mother dies and we've got to clean the place up. So there's fifty years of life...

In the course of this excavation, I came across a whole bundle of photographs, and one in particular caught my eye. It showed a boy sitting under a tree wearing some kind of school uniform, looking to be about fifteen years old. I was looking at this black and white photo, and of course the thought that arose in me was: Is this me? Or is it not me?

Because those are the two possibilities, aren't they? I mean, if you come across such a photograph, you're looking at it and there are two possibilities. This is either a photo of me or it's a photo of somebody else—it's not me.

The problem is that although I could create some kind of satisfactory narrative based on either of those answers, neither position actually sheds any light on the nature of the person who's looking now at the image, at the photo, and asking that question. All they do is create stories.

So let's go through the two possibilities. The first answer: "Oh, this is me. This is a photo of me." It doesn't work. Because it's perfectly obvious I am not that boy. I mean, I look quite different now. And I have very different thoughts and feelings. And I would never have made the same mistakes that that fifteen-year-old boy made. There's no way I would be that stupid. You know, for a start, I am not nearly as driven and confused as that boy in that photograph is. So the answer "This is me" doesn't work.

So there's only one other possibility: "This is someone else." But if I say, "Well, this is someone else," that doesn't work either. Because if this photo is not of me, then how can I be so intimate with what that boy was going through? How can I know what his thoughts and feelings were? How can I understand the situation that he was living through? So that doesn't work either.

Then I could try the variation: "This was me." But all of those answers simply are narratives. It's a sense of identity that feeds a narrative. This was me, but now I've changed, because what happened after this was such and such, and I can track it through the years. So I've got an identity narrative over time. But that's all I've got—I've just got another story.

But if I answer based on paticcasamutpada, on dependent arising, then I can create an answer that sheds light on this situation right now, on how this situation right now is constructed right now.

So, for example, the decisions that that fifteen-year-old boy made continue to shape this situation now—this one that we're sitting in. If that fifteen-year-old boy had made different decisions, we would not be sitting in this hall undergoing this retreat. This retreat would not be happening, and whatever experiences you have had since the beginning of this retreat would never have occurred.

So it's basic to the Buddha's understanding that this experience, this situation right now, is shaped in large part by decisions made previously. And this is karma-vipaka—action and its ripening.

This is one reason why karma is so important. The Buddha sees every choice as being significant because it shapes the universe. And this is why he feels it's so important that we really get to understand that process and respect it. It's easy to have a sense of powerlessness and to forget the fact that we help shape this world.

And we're doing it all the time, whether we want to or not, whether we know it or not. It's just the nature of things.

So the Buddha sees no reason to believe that death would interrupt this process of cause and effect. Death is just another event that arises and ceases dependent upon conditions. And birth is just another event that arises and ceases dependent upon conditions.

Death and what happens after—these questions are central to our fears and our vulnerabilities because we think of them in terms of the duality of existence and non-existence. My death. My annihilation. The possibility of my resurrection. For us, death has become so enormous because we think of it in terms of "mine." When we add that possessive pronoun, then it becomes really huge.

But for the Buddha, any question or answer based on the assumption of self—any question based on the assumption of self—is the wrong question, because it makes sense only inside identity. Any answer we give to it is guaranteed to be wrong.

So the Buddha does not care about theories of post-mortem survival. He has absolutely no interest in them. And when you hear people arguing against life after life, or even for it, what they're arguing about are theories of post-mortem survival. The Buddha never presents a theory of post-mortem survival. He's just not interested in it. That's not what he's talking about. He has no interest in the fate of the self.

What he's interested in is how we live now. That's important. And it's important in part because how we live now will shape the future. So what we do now is important, is significant.

To give an example of how the Buddha addresses this particular issue, if you look at the Mahātaṇhāsaṅkhaya Sutta, The Greater Discourse on the Destruction of Craving—this is in the Majjhima Nikāya, number 38. In one part of it, he's examining his students on their practice. We see the Buddha operating as a meditation teacher.

He says to them: "Understanding and seeing in this way, would you run back to the past? Were we in the past? Were we not in the past? What were we in the past? How were we in the past? Having been what, what did we become in the past?"

And the students answer, "No, bhante, we wouldn't do that."

"Understanding and seeing in this way, would you run forward to the future? Shall we be in the future? Shall we not be in the future? What shall we be in the future? How shall we be in the future? Having been what, what shall we become in the future?"

"No, bhante."

Now, you notice that in these questions, the emphasis is not on past and future. The emphasis is on the "I" who runs back to the past or forward to the future. That's what he's talking about—the identity that runs back to the past to confirm its reality, or runs forward to the future to confirm its reality. And the mature students are saying frankly, "I can't be bothered. It's of absolutely no interest to me. It doesn't occur to me to think about it, much less get agitated about it."

"Understanding and seeing in this way, would you now be inwardly perplexed about the present? Am I? Am I not? What am I?"

How am I? Where has this being come from? Where will it go? No.

So not even the self in the present—the identity within the present—is of any interest. The self needs past and future because the self needs to be. Only past and future can give the stability through time that the self needs to actually set up camp in any convincing way. But the Buddha is saying that we can't even find it here and now, much less before and after. What we have is this, and that's all we have.

So all this is bound up with the realization of anatta, of not-self, and the middle way. Identity and difference. Me, not me. Alive, dead. For the Buddha these are extremes, aren't they? The question becomes: who are we between these two extremes? Can this question be answered in the language of identity? And if we're looking for an answer, when would such an answer be available? Well, I'll give you a hint—not in the past and not in the future.

So that's my exploration of life after life and its role in the Buddha's teaching.

There's another section which we have time to go through, along with a couple of questions.

"So you're saying the Buddha remembered his previous lives. Whose previous lives?"

No, the Buddha didn't remember his previous lives. The Bodhisattva did, before the awakening.

"Before the awakening?"

Yes.

"So his identity?"

He still had an identity.

"So previous identities?"

Yes, he remembered his own past and he remembered it in the framework of "this is who I was." So he still had a sense of identity.

"Previous lives?"

Yes, but he extended it back through previous lives, which you may choose to take as mythological rather than actual. But what he did was think back on previous identities that he had held.

"So now that's not true, you're saying?"

Right. At one point he held one identity, and then later he held another, and then later he held another, and later he held another. But each time he was holding one, his basic assumption was "this is who I am." And in that assumption is also the assumption "I've always been this, I always will be this." And each time it was wrong.

So he's shaking up his sense—the solidity, the fixedness—of his sense of identity. Because he can see that he's had lots of them. None of them have stuck around. So why should this one? None of them stuck around when identities come and go. It's the personalities.

So it's a shaking up of his sense of identity. There's still underlying—he's still not enlightened—so there's still this assumption that there has to be something there. But it's just shaking him up. So it's warming him up for the awakening.

"So that's its function in the meditation practice when it comes up?"

Yes, I think so.

If he's experiencing several different identities, that must mean—for me, at least—that something is moving from one identity to the next.

Which is probably what he assumed at that time. But you know, if he is seeing several identities, they're kind of connected. So what's connecting them?

That's the question, and he found out that they weren't connected—except in terms of cause and effect. Not identity, not something that travels through. But there's a cause here that gives rise to an effect. That in turn becomes a cause for something else to arise, which in turn becomes a cause for something else to arise.

So you don't have something fixed that travels through time. You have an event now. And that event is caused in part by something that happened before, and it will be in part the condition for something that will happen later. But this event is only now.

So the past lives the Buddha saw—they have no relationship to each other?

They have a cause-and-effect relationship to each other, a karmic relationship. But it's not the same person. Not on a personal level, not on any level except the patterns of cause and effect.

It's like the example of the whirlpool. What's the identity relationship of the whirlpool that appears in spring versus the whirlpool that appeared in the same place last year? Is it the same whirlpool? Is it a different whirlpool?

It's a different belief system, a completely different way of looking at the universe, which is alien to our normal way of seeing. We look at the universe from inside a sense of identity, and from there certain things make sense and others don't. But if you step outside that framework, it's a whole different world out there. And the Buddha is operating from outside that framework.

What about those children who claim to have experienced past lives and can do things like recite chunks of sacred Buddhist texts? Is that kind of like the Buddha before his enlightenment?

Memories arise, given appropriate conditions. And these trajectories of cause and effect go back eons. So yes, a memory arises. It fits within the same paradigm. It's no different in principle from remembering what you had for breakfast. What it is, is something being created in the present, but created dependent upon certain conditions. These conditions are immense, complex. So for some people, the conditions are such that what arises in the present—what is constructed in the present—is a memory of something that happened five hundred years ago.

I used to go to Buddha House in Adelaide, which is Tibetan, and they go on and on about doing this for your next life so you'll have a better next life. This is how the subsequent traditions worked out how to persuade people to be good—the equivalent of "if you're bad you'll go to hell, if you're good you'll go to heaven." It's at the same level.

You get literature with morality tales: someone is a thief in this life and they're reborn as a poor person, or someone is stingy in this life and reborn poor, or someone generous is reborn rich. Therefore you should be generous, not stingy.

But if you look at those stories from the perspective of dependent arising, the problem is you've got a single cause and a single effect. And the Buddha makes it perfectly clear there is no single cause and no single effect. It's an immense, infinitely complex network of causes giving rise to an immense, infinitely complex network of effects.

Now the problem is that this complexity—this immense web of interconnected causes and conditions—is too sophisticated to be boiled down to a simple morality tale. So these stories just push aside the nuanced reality and present simplified narratives. Hopefully they produce the right ethical result for their audience. This may explain why someone like Stephen Batchelor reacted so strongly to these teachings—coming from a tradition that placed enormous emphasis on believing these literal interpretations.

I mean, there's the whole concept of what's called the ālaya-vijñāna—the store consciousness or substrate consciousness in Tibetan Buddhism. I've even heard Ajahn Mahabua speak about this years ago, discussing the consciousness that transmigrates from one person to the next. Even among Buddhists, there's often strong belief in something substantial that actually moves from here to there.

But we can understand this more skillfully through simple cause-and-effect relationships. Picture a line of billiard balls—when one is struck, the energy appears to move through each ball in sequence. It looks like the same energy traveling through, like there's continuity of some thing, but it's actually just cause-and-effect relationships operating at each point of contact.

What we're talking about is causal continuity, rather than continuity of identity. Rather than some unchanging essence that remains the same throughout, we have causal continuity—a trajectory of cause and effect flowing forward through time.

Shall we explore the cultural dimensions of this teaching? I'd like to share some observations about why our particular culture has such difficulty coming to terms with the teaching of rebirth. It's really about our specific cultural conditioning.

Everyone raised in a culture—which means everyone—is conditioned to cling to certain beliefs as obviously true and right. We're often shocked when we encounter another culture that doesn't share these assumptions. We wonder why they haven't gotten their act together, not recognizing that they're simply clinging to different cultural certainties.

In our culture, we cling to science. Human beings crave certainty, and we've been trained to seek that certainty through science. Science, we believe, will tell us what's actually happening. For any belief to be worthy of acceptance, it must pass some kind of scientific test—which in practice means it must fit within standard materialist orthodoxy. Obviously, rebirth immediately gets eliminated by this filter.

When the Buddha's teachings differ from scientific materialism, we tend to frame this as a conflict—Dharma versus science. We see a battle requiring us to choose sides, forced to select either Dharma or science. This is exactly the same predicament that fundamentalist Christians face when they feel compelled to choose between Biblical literalism and scientific findings.

But Dharma is not science, nor is it contrary to science. It's simply a different discourse entirely. Dharma is teaching about the nature of human experience from the perspective of the experiencing subject—the one actually undergoing the experience.

Consider this example: It's commonly stated in Buddhist books and teachings that the Buddha taught the universe is beginningless. Have you encountered this claim? The Buddha never actually said this. What he said was: "A beginning to this saṃsāra cannot be discerned." There's a profound difference between these statements.

"The universe has no beginning" is an ontological statement about the nature of the world out there. "It is impossible to discern the beginning of saṃsāra" is not a statement about the universe itself—it's a statement about the nature of human experience and the limits of our perception.

This distinction is crucial. It's the difference between a third-person statement and a first-person statement. Science operates as third-person discourse, claiming to describe the objectively existing world out there. Dharma concerns itself with the nature of human experience itself.

Therefore, Dharma cannot actually conflict with science, because it addresses an entirely different domain of inquiry.

If we get the two of them mixed up, then if you bring in a doctrine or teaching like life after life, you've either got to believe it or take a scientific approach. In other words, if you want evidence for the teaching of life after life, where will we find it? Well, in our culture, we would think we find it in science.

And there are scientific studies about this. The famous one is University of Virginia collecting immense amounts of data about memories of previous lives of people who actually have, or claim, memories of previous lives. And some of these have been checked out and they appear to be valid. So you have sociological evidence that fits within science.

But from the perspective of Dharma, if we're looking for the evidence of the teaching of life after life, where would we find it? We would find it in the nature of our experience, right here and right now. This is where we would find it. Experience arises from a cause, and it ceases from a cause, and this process rolls on and on and on. And I've never experienced the beginning of it, and I've never experienced the end of it. All my experience tells me is that an event arises because of causes and conditions, it ceases because of causes and conditions, and another event arises because of causes and conditions, and it ceases because of causes and conditions, and so on.

So science tends to get in the way. And this is linked with our determination to cling to familiar cultural categories. Anything new in the Dharma that we come across, we force to fit into these preconceived categories. We don't generally consider the possibility of making the effort to view the world differently, the way the Buddha viewed the world.

Dharma is not a European cultural category—it does not appear in European culture. So what we tend to do when we come across Dharma is chop it up into categories that are familiar to us: science, for example, or religion. These are the two obvious ones. Science can be subdivided. Psychology—the Buddha taught psychology. Or philosophy—the Buddha taught philosophy. So we can divide it up.

We can even be more sophisticated. We can say some aspects of the Dharma are science, some aspects are psychology, some aspects are philosophy, some aspects are religion, like all this life after life business. So we'll just ditch the religion ones and keep the others. This is somehow purer.

But the problem we create there is that we necessarily misunderstand Dharma, because science, psychology, philosophy, but above all religion—these are European cultural categories. They are not Indian cultural categories. At least, Dharma does not fit into any of these categories. The Buddha did not teach psychology. He did not teach science. He did not teach philosophy. He taught Dharma. It's a different category.

If we try to take Dharma and make it conform to some European cultural category because it's familiar to us, we end up hobbling the Dharma because there will be aspects of it that simply do not fit there. So what do we do with them? Well, we chuck them out because it's not respectable. It's not scientific. It's not whatever.

So it's a question of us being willing to go to the Buddha. You're talking about Dharma. We don't know what Dharma is because we come from a European background. So you have to teach us. And we have to make an effort to actually try to figure it out. But generally, as a culture, we're not prepared to actually do that.

A student responds:

"It's true to me, not so much that it was a European thing, but it takes a lot of effort to keep on resisting, in my observation—keep on resisting the urge to either turn Buddha into an interventionist who will do something for us. And I have seen... not just Europeans do that, but I pray to Buddha to do something, which is not part of the plot. And the other thing, I think it takes a lot of effort to resist this self thing coming back after life. And that's not just the Europeans. I'll come back as well. So it's almost... it's so revolutionary that I think the human tendency is always to dilute..."

This Buddhism in those two directions, and it's not necessarily European. I agree with that—this is what the first part of the talk was all about. The commitment to self is so strong in everybody that it's very difficult to get a hold of this. So even in Asia you find people making exactly the same moves if they haven't actually got anatta. If you don't get anatta, you don't get life after life. I think it's almost unnatural to get it—you have to work at it.

Plus there's the extra stuff, the cultural stuff on top. So this is the extras that we're talking about here. So yes, I agree with you.

Then there's the issue of imagination, which I think is very important. Patrick, are you sort of arguing against the passing of Buddhism into parts so it can be digested by the West?

Oh no, that's... We're missing out on loads. Within itself it's fine. Take Buddhist psychology. You take aspects of the Buddha's teaching and meld it with Western psychology—the result is fantastic. A lot of dukkha is relieved. But to then make the move, "Well, it's just the psychology..." Okay, fine. You're a psychologist. You're out there doing mindfulness-based interventions. And someone says, "Well, wait a minute. Don't people worship the Buddha? Isn't Buddhism a religion? How can you advertise this workshop where it has Buddhist stuff when we're a secular organization? We don't do that. We don't do religion." Oh. Yeah. You're caught. You're in this fly trap.

It's kind of like a Trojan horse, I think, in some ways. Like psychology—Buddhism and psychology in the West at the moment, it can be used as a treasure, of course. Do you listen to Buddhist Geeks? They had one episode some time ago called "Stealth Buddhism"—the idea of infiltrating the secular mindfulness movement and converting people to Buddhism. Which, if you're a Christian or whatever and you heard that, you'd be given all the more reason to reject all these mindfulness movements. It's the same path. Instead of saying, "Well look, it's Dharma, it's not religion. But if there's something in Dharma that can be helpful, go ahead."

So this comes to a challenge of imagination. Part of any tradition is imagination—is how we imagine things to be. And that includes religion and it includes science. So science, we know, is based on empiricism. But there's a large body of scientific teaching that people subscribe to without any empirical foundation whatsoever. Take the whole field of quantum mechanics. How many people have empirically experienced quantum mechanics? Or the Big Bang. The number of people who confidently assert, "Yes, yes, the Big Bang. That's how the universe began." Really? Were you there? How do you know? They had formulas.

So basically scientists would take a series of equations that work and that provide an elegance of expression. When you hear the scientists talking, the elegance and the beauty of the equation is very important for them in terms of what they decide is true. So they have a certain set of equations which they take to be elegant. You can see Vedana—he's operational here. And then they imagine a universe based on those equations and then they write books and go on TV and say this is what the universe is. And we say, "Oh yeah, it must be so because it's scientific." But it's certainly an act of the imagination.

It doesn't matter though because it's not... If they say dinosaurs were on the earth, that doesn't affect how we live now.

In some ways it doesn't matter. But let me continue.

Where it matters is this: as a culture we are conditioned to imagine the world in certain ways—ways that strike us as being quite natural. And so we resist the idea of imagining the universe differently. Life after life, as a doctrine, is part of a broader package that imagines the universe very differently from the way we imagine the universe.

The Buddha imagines the universe as infinite in space, in time, and in possibilities. Infinite time, infinite space, infinite possibilities. This is an act of the imagination—a way of imagining the universe.

Consider how Western culture has imagined the universe. For thousands of years, the Western universe, largely defined by Aristotle, was imagined to be a flat earth with a dome above it, which was the sky. This dome had holes through which light shone, because above the dome was heaven, and the light from what we call stars was the light of heaven. The sun traveled across beneath the dome, and its brightness blotted out all of that heavenly light.

Today we imagine a much bigger universe. According to my Google search, the universe began 13.8 billion years ago. And if Google says it, it must be true. The Big Bang—there was this Big Bang 13.8 billion years ago. So it's a much bigger universe. But again, it's an act of the imagination. We do it quite naturally because of our cultural preconditionings.

Sometimes those who deny life after life do so on the grounds that we in the West are scientific. We cannot be expected to subscribe to non-scientific, even anti-scientific beliefs. We don't do non-science. We do science. That's what we do. But this is just another way of limiting our imaginations. Why not learn to imagine the universe differently if it's useful to us?

It's interesting that those who deny life after life also tend to deny the reality of awakening as a reality. This makes perfect sense because life after life gives the time and cosmological space to make the awakening project viable. If I've only got 80 to 100 years, I don't like my chances, frankly. But if I've got an infinite universe with infinite possibilities, with a trajectory that's rolling along, it's possible.

This particular act of imagination has a genuine impact on the way I live and approach practice. I don't shut down possibilities. I open up to them. What would it be like to imagine the universe as infinite and ourselves as part of a universal network that is not limited by any self-identity? What would it be like to inhabit such a universe? Perhaps it would encourage us to open up to possibilities that under conditions of normality we would never imagine, or would never accept, never consider. In part, this is an opening up of the imagination.

Other cultures have learned to imagine the universe differently. The Buddha and the traditions following him have learned different ways of imagining the universe. Why should we be so culturally insular that we simply refuse outright to make that adaptation?

Due to karmic whatevers, I have a connection with South Korea. I find South Korean culture to be incredibly interesting and dynamic. If you look at the history of Korea—much of it tragic—a couple of hundred years ago they imagined the universe in a way

they had imagined it for thousands of years: in a very straightforward East Asian, Buddhist, Confucian, shamanist, Taoist way. Then around the 18th century, books began to creep in from Beijing about this new Western belief system called Christianity. These people imagined the universe in a very different way—ways that, when studied by a few members of the Korean elite, overthrew much of their social and political certainties about how society should be operated.

Then came other things: modernity crashing in, revolution, war. The Koreans have gone through this incredible transformation in which now they imagine the universe in ways very, very different from the way their ancestors imagined the universe. And you have this dynamism within that culture.

I contrast this with people like, for example, a certain Pauline Hanson, who some years ago saw street signs in Sydney written in Chinese and said, "We don't do that. We're Australians."

I'm not sure. The word "secular" is actually problematic because what makes something secular versus what makes something religious? These are culturally determined categories that emerge from a particular cultural history. What we call "secular" is often simply the dominant worldview of our culture at a particular time.

I think the real question is not whether something is secular or religious, but whether it's helpful. Does understanding dependent arising through chaos theory help you to understand dependent arising? If it does, then use it. If it doesn't, then don't. The Buddha was completely pragmatic about this. He said, "I teach suffering and the end of suffering." He wasn't interested in creating a religion or establishing secular versus religious categories. He was interested in what works.

The danger comes when we get too attached to our categories—when we say something must be secular or it's not valid, or something must be religious or it's not authentic. Both approaches can become forms of fundamentalism. The secular fundamentalist says, "If it's not scientifically proven, it's nonsense." The religious fundamentalist says, "If it's not in our tradition, it's heresy." Neither approach serves the goal of understanding reality more clearly.

What the Buddha is offering us is a way of investigating reality directly, through our own experience. Whether we use scientific metaphors or traditional Buddhist language, the important thing is that we're actually doing the investigation. The concepts are just tools. Don't mistake the finger pointing at the moon for the moon itself.

So if chaos theory helps you understand how everything is interconnected and nothing exists independently, wonderful. If it doesn't help you, then perhaps the traditional teachings about dependent arising will be more useful. The key is to remain flexible and experimental rather than getting locked into any particular conceptual framework.

The universe is far more mysterious and wonderful than any of our concepts can capture. Whether we call our approach to understanding it secular or religious is really beside the point.

I don't know. What does secular mean? It's a very vague, slippery term. The problem with words like secular is that they're often used in the context of some kind of competition for who's right and who's not right. So even to use the term means you're stepping into the contest.

But clearly there are aspects of Western culture which can be used as an entry point into understanding where the Buddha's coming from. And we would be wise to employ them if we're interested in coming to terms with the Buddha. But there's also coming from his side as well. Like your interest in the suttas—we go to him and try to work out on his own terms what he's talking about and where he's coming from.

It's easy to read. I don't know.

Okay. Thank you very much. Thank you for listening.

CHAPTER 25

Preparing the Fire

Patrick Kearney · 1h06

> *In this engaging dharma talk, Patrick Kearney delves into the remarkable events preceding the Buddha's third major discourse, the Ādittapariyāya Sutta or Fire Sermon. Following the Dhammacakkappavattana Sutta (SN 56.11) and Anattalakkhana Sutta (SN 22.59), this teaching marks a pivotal moment in early Buddhist history.*
>
> *Kearney masterfully narrates the conversion of Yasa, a wealthy banker's son who experienced profound dukkha-ñāṇa (knowledge of suffering) and became the first layperson to attain stream-entry and take refuge in the Triple Gem. The talk then follows the Buddha's strategic journey to Uruvelā, where he encounters the three Kassapa brothers - fire-worshipping ascetics leading 1,000 followers.*
>
> *Through vivid storytelling, Kearney describes the Buddha's shamanic displays of power over 24 days, including his dramatic confrontation with the nāga-rāja in the fire chamber and various miraculous demonstrations. These events reveal the Buddha's skillful means in adapting his teaching methods to different audiences - from progressive instruction (ānupubbī-kathā) for laypeople to shamanic challenge for ascetic practitioners. The talk illuminates how Buddhism absorbs rather than rejects local spiritual traditions, setting the stage for the famous Fire Sermon that would complete this trilogy of foundational teachings.*

So next we're going to talk about the third discourse, burning. We've looked at the Buddha's first formal teaching, Dhammacakkappavattana Sutta, setting in motion the wheel of the Dharma. Then we looked at Anattalakkhana, the not-self characteristic, which was taught five days later. And then we move on to what is regarded as the third discourse, although in fact he gave talks in between times.

For this, we have to have a bit of a backstory. This one is called preparing the fire because the third discourse is usually called the fire sermon or the fire discourse—you could translate it simply as burning.

The build-up to it I find very interesting because it's weird. First of all, we left the Buddha and his five disciples. They're now all Arahants and they're living at Isipatana. The job's done, they're all fully enlightened, so they're feeling pretty chilled and they're not rushing off anywhere—they're just living there. Isipatana is just north of Baranasi, which is a major merchant city.

Living in this city there is a setthi, usually translated as banker, but probably more like the head of the banker's guild—basically someone who works in high finance at the time. This banker had a son called Yassa, and he was brought up in great luxury, of course. He is a young man and he lives in this big room, attended by beautiful female attendants who basically look after him in all sorts of ways which we won't go into.

One night they're all sleeping in the same room and he wakes up in the middle of the night. He looks around and sees all these beautiful women sleeping there, and he's suddenly overcome by horror and dread. He has what in the later tradition would be called dukkha nana. Dukkha, of course, is suffering, unsatisfactoriness, pain. Nana is understanding or knowledge. It sounds like he had a very strong case of adinava nana and nibbida nana. Adinava is danger, disadvantage, downside—suddenly seeing the disadvantage or the downside of any situation. And nibbida is disenchantment. The discourse says that the downside, the adinava of what he saw became apparent, and his heart settled upon disenchantment, nibbida. And he says, "The terror, the horror."

Now what he saw was the human body. But he saw it without any filters of enchantment. So he's living in a world which is dominated by beauty—he's particularly fond of female beauty, and of course he's completely caught up in this world. Then quite unexpectedly, without any warning, no preparation, he just happens to wake up in the middle of the night. His eyes fall upon these bodies sleeping there, and all the illusions drop away, and all he sees is the human body, which is actually rather weird when you consider it. Basically he hasn't turned into a Puritan; it's just that he suddenly sees that a body is just blood, bones, flesh and mess, and that's all it is.

So he has this profound existential shock which is completely unprepared for. As a result, he's in a state of shock, both mental and physical, and he stumbles out of the house, into the city, through the streets, and then out of the city. According to the text—and the text is the Mahavagga of the Vinaya Pitaka, the first history of the Sangha, the earliest history, so these stories come from there—he leaves the city via the gate, aided by the non-humans, amanussā, according to the text, who help him out.

We kind of read this or listen to this and think, well, you walk through the gate and apparently somebody helped him. But the non-humans, the amanussā, are some kind of spirits. Keep in mind that this is an ancient Indian city. At night, the gates are closed and locked for security purposes. Outside every gate there would be a kind of basic motel for travelers who arrived after sunset when the gates were shut, so they could stay there overnight. There is no way those gates would be opened. It's just too dangerous. The gates are carefully guarded by the troops.

And each gate is also guarded by spirits. The way this was done, particularly for city gates which were very important, was that either a powerful local spirit would be captured in some way and trapped there with the use of an image, or if they couldn't manage that, they would execute criminals at the gate and bury them. Their vengeful ghosts would become guardians of the gate. So these spirits at the gates were not happy, friendly spirits at all. And yet they help him through, and he's getting through a locked gate with lots of human guards, but somehow he passes. You can see that we're in the realm of fairy story here.

So he stumbles out of the city. One would presume a banker's house would have a few guards and locks on it too, wouldn't it? And well-paid individuals guarding them.

Gates, of course, are important because they're liminal places—places of transition. To move through a gate is to move from one state to another. They're places of potentiality where what is normally taken for granted as real becomes unstuck and something else can emerge. I think this whole story of the gate emphasises this transformative process which is going on for Yasa.

So he wanders north mumbling "the terror, the horror" and happens to stumble into the Buddha, who is doing walking meditation. This is not long before dawn. The Buddha has gotten up early and is doing his walking meditation. He sees Yasa coming and hears him mumbling, and he says, "This is not terrible, not horrifying. Come, Yasa, and I will teach you Dharma."

The Buddha sees Yasa and immediately recognises someone whose mind is ripe as a result of this profound shock. Everything that he thinks is real turns out not to be. Everything that he thinks is worth holding on to turns out not to be. In this state of profound shock, the Buddha sees someone who's ready for the teaching.

So the Buddha gives progressive instruction: dana, sila, and then sagga, the heavens. Dana is generosity. Sila is ethics. The heavens mean if you are generous and ethical, you are doing good things. Your karma is good, so your vipāka—the ripening of these actions—is very positive, and these will give you noticeable benefits in recognisable form in terms of living a good life. Of course this gets extended beyond death, life after life—the heavens. Heaven is basically having a good time without any restriction. These are the mundane benefits of leading a good life.

Then he talks about the danger or disadvantage in sensual stimulation and the benefits of letting go or renunciation. Yasa is listening to this progressive instruction—first the basics. With progressive instruction you give a very basic teaching and then check:

have you got that? Have you connected with that? Maybe you stop there because that's as far as the person can go. But if they can go a step further, you take it the next step. If you think they've got that and they're ready to go further, you take it the next step.

This progressive instruction is a graded introduction into the Dharma, a basic template that many traditions use. Finally, when Yasa's heart was quite ready, receptive, free from hindrances, eager and trustful, then the Buddha hits him with the four truths: dukkha, its arising, its cessation and the path. The Buddha teaches him the same thing he taught the five ascetics after he had opened them up with the middle way. Here he teaches Yasa, who's a layman, after opening him up with this progressive instruction.

As a result, Yasa attains the first stage of awakening. He sees the Dharma. This is what's going on. He's enlightened, at least to the first stage.

This is the first time that this idea of progressive instruction is mentioned. But the Buddha uses it now again and again. It's like the Buddha is working out how to spread this further. He's got the five, but he has to teach other people as well. How is he going to do that? So he works out this template of progressive instruction, and Yasa is the guinea pig. There's a sense in which the Buddha has been waiting for him to turn up.

Of course, Yasa is a lay person. This is the first lay person who is being taught serious dharma. And when it's done—bang—the first lay person to attain the first stage of awakening.

So Yasa was taken care of. Meanwhile, time had passed. The household had awakened, and people realized that the young man of the house—the heir to the fortune—had vanished. Of course there was pandemonium. Chaos erupted as everyone desperately searched for him. Had he been killed? Had he been kidnapped? How could he have simply disappeared? What was happening?

Yasa's father, presumably at the head of something of a posse, went out in search of his son and also headed north, eventually meeting the Buddha. By this stage, there was daylight. They had eaten breakfast and were sitting around. So there was the Buddha sitting with the five companions plus Yasa, and then Yasa's father approaching with a posse from the distance.

The Buddha thought, "I should try to avoid distracting Yasa senior, the father." So what he did was exercise his shamanic power and cause Yasa, who was sitting right there, to disappear—to vanish. This is interesting because it shows the Buddha as shaman, a side of his character which tends to be written out but was very much part of his identity.

The Buddha then calmed down Yasa's father and gave him progressive instruction. Sure enough, the father also attained stream entry and became the first person to take refuge in Buddha, Dhamma, and Sangha—which is what we chant each night. He was the first person to do that. You can see that the institution of Buddhism was beginning to take shape, along with lay practitioners.

During this talk, Yasa was listening and reviewing his understanding as it progressed. As a result, he attained full awakening as he sat there. The text says: "Then Yasa, son of a good family, as the Dharma was being taught, reviewed the degrees to which he had seen and experienced, and by not clinging, his heart was liberated from the taints."

"He reviewed the degrees which he had seen and experienced." Those familiar with the system of ñāṇas, of insight knowledges, know that there is one called review, and this is the first mention of it in the texts. It's interesting that awakening is something that can be thought about, considered, reviewed. There's a rationality within this understanding that we're developing. It's direct, it's intuitive, but there's also rationality in it. The two sides sometimes struggle—too much imposition of rationality kills the experience, while not enough rationality makes it meaningless and chaotic.

So Yasa ordained and became a bhikkhu. Word of this spread throughout the city. Four of Yasa's friends came out to visit him, and they converted, ordained, and became fully awakened. Others came, and basically the word was spreading—notice it was spreading throughout the merchants of Varanasi.

This is really important. The Buddha very early on realized that if he was going to make a go of it in terms of building something significant, he needed people with money. He targeted them immediately. The first lay people he approached were the commercial elite of a commercial city. It sounds like a Sayadaw's model.

Finally, when there were sixty arahants plus the Buddha—making sixty-one fully awakened ones—he sent them out into the world. There you get the famous passage: "Don't go two by two, but singly, and go off for the benefit of the many, the welfare of the many," and so on.

I find this very interesting because these people were very new. We don't know how long the Buddha spent there—weeks, maybe months—but they were very new. They were fully awakened, and many of them were very young. Yet he simply sent them out: "Just go off and do whatever you do." And not even in pairs within a system of control where "I'll watch you, you watch me. If he does anything bad, report back to headquarters." The Sayadaw would do that. But no—it was one by one.

In other words, he has complete confidence in these people, complete faith in them. "You just go and do it. Off you go."

The Buddha himself says, "I shall go to Uruvela, to Sena Nigama, to teach the Dharma." So he sends everybody else out to wander around the world, but the Buddha has a very specific place that he intends to go to.

It's interesting that although the Buddha is very successful in Varanasi, he doesn't stay there, nor apparently does he return. I don't know of any other stories about him which are set in Varanasi. He starts there, he has a spectacular success, but then he leaves and he doesn't come back.

So why not? Possibly because it just wasn't important enough. Varanasi was on the borderland between the two rival kingdoms of Magadha to the east and Kosala to the west. Wars were fought between them, and sometimes one side would grab it and sometimes the other. At this point it belongs to Magadha—it was the dowry of King Pasenadi of Kosala's sister, who had married King Bimbisara of Magadha. So at this point it belonged to Magadha, though later it would be fought over again.

The Buddha heads east toward Magadha, which is one of the two major kingdoms. It's also an area that he's familiar with. He's been there before and had apparently met King Bimbisara before, according to legend. So he's going to the big city in an area that he already knows, where people know him—not as the Buddha, but they know him because he's been there before when he was a wandering ascetic, possibly even before he began his ascetic practices, when he was on his way to find a place where he could undertake them.

Maybe what was happening was he wanted to go to the center of things. He was planning to build an empire. If you strike it big as a guru in, say, Australia, and you want to hit the big time, what do you do? Do you stay in Australia? No, you go to the US. Because if you make it big there, you can spread across the planet. I think the Buddha basically had the same business plan. In fact, later on, when he gets an offer to go to Kosala by a rich merchant from Shravasti, he quickly abandons Magadha and makes his headquarters in Kosala, which was the biggest kingdom.

So the Buddha is a man with a strategy. He's got a plan. He's picked up this idea of teaching. At first he thought, "I don't know if it's even possible." It works, at least for all these crazy ascetics. Then he's trying to work out, "But can I include lay people here?" And sure enough, it works. "Okay, now I've got a product, and I can market this. I'm ready now."

So off he goes to the big smoke. But before he goes, he's got an important errand to do. Because he doesn't go to Rajagaha, which is the capital—he goes to a small district called Sena Nigama at Uruvela. This is an area in the Gaya district on the banks of the Uruvela River, not far from where he was awakened, so he knows this area.

And he enters the territory of the three dreadlocks wearers, the jatila. These are ascetics who have dreadlocks, and they're brothers. Each of them is called Kashyapa, which probably means they were Brahmins. There was Kashyapa of Uruvela, who was head of 500 ascetics; Kashyapa of the river, Nadi Kashyapa, head of 300 ascetics; and Kashyapa of Gaya, Gaya Kashyapa, head of 200 ascetics. So these are three brothers, each of whom are major teachers in their own right.

And the Naga, whose residence this is—the Buddha has essentially walked uninvited and unannounced into the living room of a powerful and not particularly good-tempered spirit who doesn't appreciate this intrusion at all. The Naga becomes enraged and produces smoke and flame to indicate his irritation.

The Buddha sits there calmly and produces smoke and flame in response. "You can do it, I can do it."

This escalates into a full supernatural battle. The entire fire chamber fills with flames as these two beings engage in a contest of psychic powers. Through the night, smoke and fire pour from the building. Outside, Kasapa and his ascetics watch in amazement and growing concern as their sacred fire chamber appears to be burning down. They're convinced that this beautiful young samana, impressive though he seemed, is surely being incinerated by the terrible Naga.

But when dawn comes, the Buddha emerges from the fire chamber completely unharmed, carrying the Naga coiled peacefully in his alms bowl. The spirit has been completely subdued—not destroyed, but tamed and converted. This is a crucial detail: the Buddha doesn't kill or banish the Naga. He transforms their relationship from one of hostility to one of peace.

Kasapa is astounded. This is clearly no ordinary ascetic. But he's not quite ready to concede spiritual superiority. "Great indeed is the Samana," he admits, "great indeed is his psychic power. But he is not awakened like me."

This becomes the refrain throughout what follows. Each time the Buddha demonstrates miraculous powers, Kasapa acknowledges his greatness while maintaining that he himself is still the awakened one, the spiritual authority in this territory.

What unfolds next is an extraordinary series of supernatural demonstrations. The Buddha stays with Kasapa's community, and day after day performs miraculous feats. He appears to be playing a very deliberate game, systematically displaying different categories of psychic abilities.

When the ascetics need to gather wood for their fire sacrifices, the Buddha causes all the wood they need to appear magically, perfectly cut and ready. When they need to light their fires, he lights them with his mind. When they need their ritual implements —axes, hatchets, various tools—these appear spontaneously. He demonstrates mastery over the elements, over matter itself.

He shows that he can read minds by answering unspoken questions. He demonstrates clairvoyance by describing distant events as they happen. He multiplies himself, appearing in several places simultaneously. He walks through walls as if they were empty space. He rises into the air and moves through the sky like a bird.

Each miracle is precisely calculated to address the specific spiritual obsessions of these fire-worshipping ascetics. They spend their time gathering wood, lighting fires, performing ritual sacrifices. The Buddha shows that he can accomplish effortlessly what requires all their elaborate ceremonial effort.

But he does it carefully so that the Naga is not harmed.

The Naga angrily blazes up in fire, in flame. And so the Buddha enters into the fire element and he also blazes up in flame. The text says that with both of them ablaze, it was like the fire chamber itself was in flames, burning and blazing.

All of these ascetics—five hundred of them—are sitting around watching, because everybody wants to see this. Their whole fire chamber is just burning away with huge flames. They're looking at this thinking, "We haven't seen this before. This is interesting." And they say, "The great Samana, who is so beautiful"—and it's interesting, this is what people would say about the Buddha when they met him—"The great Samana, who is so beautiful, is being destroyed by the Naga."

In the morning, the flames have died down. Of course, the place is still there—these are shamanic, magical flames. Out of the door steps the Buddha, completely unharmed, totally cool. He's carrying his bowl, as usual, because he's a bhikkhu, a beggar. He walks up to Kasapa and stands in front of him.

Kasapa looks into the bowl, and there's the ferocious royal Naga—now a tiny little snake all curled up, completely harmless. The Buddha explains to Kasapa how the Naga's fire was exhausted by fire—fighting fire with fire.

Kasapa doesn't say anything, but he thinks to himself: "This guy is very powerful, but he's not an Arahant like I am. He's not fully awakened like I am."

What's happening, of course, is the Buddha is acting as a shaman. In entering into that fire chamber, he's deliberately challenging the Naga. It's no accident. This is quite deliberate and quite macho—come out and fight. In winning and showing his mastery over the fire element, he's also challenging Kasapa, but indirectly.

Kasapa's practice revolves around the fire element, and the Buddha is in effect saying—without actually saying the words—"I am much more powerful than you are and therefore superior." This is the challenge that Kasapa is receiving. The Buddha is showing himself to be a master of one-upmanship.

But Kasapa is impressed, but not converted. The reason is because he feels that power is one thing, but awakening is another. "Okay, this guy is incredibly powerful. In fact, he's so powerful, the sooner we get rid of him, the better. But so what? That doesn't mean he's awakened—like me."

He apparently welcomes the Buddha into the community as an honored guest, but he does not take the Buddha's superior power as evidence of awakening. That instinct is very good—people often confuse power with awakening. You can have a guru who can manifest all sorts of power, be incredibly charismatic, and people think, "Oh, he's got these powers, he must be awakened." But it's complete bullshit. Power is power. Awakening is awakening. They're not the same thing.

Kasapa knows that. He's a man of wisdom. You can see why the Buddha wants him, because what the Buddha is doing is trying to convert this guy. He really wants him in the company.

But Kasapa is also very stubborn, which reminds us, of course, of the Buddha before his awakening. He was very stubborn too. You can't help but feel that the Buddha knows exactly who he's dealing with. In a sense, it's like he's dealing with his pre-enlightenment self—what he was like, except this guy is in a different tradition.

The problem Kasapa has is he's deluded about the nature of awakening. He thinks he's awakened, but he's not.

And the Buddha needs to hammer this out, get this view out of his mind.

Now when the Buddha was dealing with the five ascetics, how he opened them up was by the middle way. Here he's got a different person in a different context and he's using a completely different method. And it's really interesting because it's not a method he uses again. These are very weird stories. But for Kasapa he thinks this is the way. I've got to hammer this guy. And so he does.

So the Buddha takes up residence in a jungle thicket near Kasapa's hermitage. You notice that Kasapa on the one hand treats him as an honored guest but on the other hand keeps him at arm's length. He doesn't want him too close. It's like there's a wariness in the relationship.

Anyway, that night the Buddha is meditating and the four divine kings come to the Buddha. Now these are gods—the god of the north, the south, the east and the west. And they're just above the earth realm. So they're quite junior. So they come and visit the Buddha and they light up his jungle thicket quite like pillars of fire. So again you have fire. And there are four pillars of fire in this little jungle clearing, blazing away all night. And if you imagine Kasapa and the ascetics are having a hard time getting to sleep because they look up, oh my God, those pillars of fire are still there.

Anyway, next morning, Kasapa turns up to tell the Buddha that the meal is ready. They're feeding him. He's a guest. And he says, so you had some visitors last night? And the Buddha says, yes, yes, the four divine kings, they came. And so Kasapa is impressed, but he continues to think, very powerful, that he's not enlightened like I am.

So then you get this bizarre relationship that develops. The Buddha sticks around. He's like the man who came to dinner. He won't leave. And they can't get rid of him because he's so powerful. So they keep him kind of tucked away and hope that this whole thing blows over before it gets weird.

Anyway, next two nights, the same events take place. The first night, Sakka, ruler of the gods, turns up, blazing fire. The next night, Brahma Sahampati, blazing fire. Remember him? He was the one who persuaded the Buddha to teach. Each morning, Kasapa turns up to invite the Buddha to the meal. I noticed you had a visitor last night. Yes, yes, Brahma Sahampati. He just came in for a chat. But again Kasapa responds in the same way.

Next Kasapa has a great sacrifice that has to be done. Now this is a big occasion. People are coming from all over Magadha and Anga. Anga is the territory to the east. So this is southeast Ganges Valley and it has its own particular regional kind of spirituality. Within this region Kasapa is a very important figure. He's known all over the region and when he has his annual great sacrifice people come from all over to attend.

Now he's worried because he hopes the Buddha doesn't actually show up and upstage him by displaying some showy miracle. So he's a bit agitated because if he did, Kasapa might lose his customers. They might all go over to this new guy. Now the Buddha of course knows what he's thinking and so he makes a point of quietly disappearing and not interfering.

So it doesn't say whether they were killing living beings or whether it was a sacrifice more symbolic like the Vedic sacrifice involved ghee and various other things put into fire. There are different forms of sacrifice. We don't know which kind. I suspect non-violent, these are ascetics, so I suspect symbolic things were tossed into the fire. There'd be chanting, ritual and so on.

Now that means the Buddha decides he's not going to get fed by the ascetics so he goes on alms round. And so he goes to Uttarakuru and gathers food there and then takes it to Lake Anottata in order to eat it.

Now you're probably wondering, where is Uttarakuru? Remember we talked about the four great continents. In the middle was Mount Meru. The Buddha lives on the southern continent, and Uttarakuru is the northern continent. So the Buddha flies over Mount Meru, goes on alms round, flies up to the lake which is in the Himalayas, and has his breakfast there.

Next morning Kasapa turns up and says, "So where were you yesterday?"

"Oh well, I just went to the northern continent for alms round and then I had my breakfast at this lake in the Himalayas. I wanted to avoid the rush hour."

So Kasapa is getting really stressed by this stage. This is getting weirder and weirder.

Anyway, that day the Buddha acquires a piece of discarded cloth. The way he makes his robe, he collects discarded cloth and he washes it and prepares it. He collects it so when he's got enough he can make a robe. He collects this bit of cloth and he wants to wash it, except that there's no suitable washing place in his jungle thicket. But no problem, because Sakka, king of the gods, rockets down and creates a pond so he can wash it.

But then he realizes that he can't wash it properly because he hasn't got a stone to beat it upon. But no problem—Sakka provides a stone for him. And then he's got to hang it to dry. And Sakka, who is still there... No, actually, this time it's not Sakka. There's a kadumba tree, and the spirit of that tree, the deva of that tree, bends a branch down so it can be used as a washing line to dry out his cloth.

Next morning, Kasapa turns up, invited for breakfast. "Hmm, that pond wasn't there before. I don't recall seeing that stone before. That branch wasn't there before. So okay, how did all this happen?"

"Well, I got this cloth and Sakka turned up, then the tree deity bent the branch."

"Okay, okay, very powerful, but you're not enlightened like I am."

And then on successive days, Kasapa comes to invite Buddha to the meal. The Buddha says, "Look, just go on without me." Now apparently the meal was actually taken at the fire chamber. So Kasapa walks back to the fire chamber, enters, and the Buddha's already sitting there. So he just kind of flew there. But not only that, he's sitting there with some fruit that he's just collected—except that the kind of fruit that he has is fruit that can't be found within five hundred kilometers.

On the last occasion, the Buddha's sitting there with a flower from the heaven of the Thirty-three Devas. So you get this sense of just escalation here.

Next day, the ascetics have to... they're fire ascetics. They worship the fire. So they use up a lot of wood. They're constantly chopping up logs for the fire. But suddenly they can't split logs. They just can't do it. And Kasapa suspects the Buddha's intervention here. The Buddha is interfering in some way. And sure enough, the Buddha turns up and says, "You blokes seem to have a problem."

"Yeah, we just can't split logs."

And then the Buddha goes, more or less, "Let the logs be split." And suddenly, all the logs are split. "Go ahead, no problem."

And then the next day, this time they can split the logs, but they can't light the fires. But the Buddha turns up—"Ah, okay"—and the fires are lit. And the next day they can split the logs, they can light the fires, but they can't put them out. So the Buddha turns up—"Oh, you've got a problem there"—and the fires go out.

So every day the Buddha's just chipping away at Kasapa. And every day Kasapa has the same response.

"Yeah, very impressive, but you're not enlightened like I am."

This continues for twenty-four days, until the eight mid-winter nights arrive. During these nights—the coldest of the year—the ascetics perform their ceremonial bathing in the river. The Buddha, in his compassion, creates five hundred braziers so they can

warm themselves when they emerge from the icy water. Here we see his metta and karuna, his loving-kindness and compassion flowing forth. Yet again, it's expressed through this showmanship, this extravagant display of magical powers.

Twenty-four days after all this begins, a flash flood strikes. The place where the Buddha is staying becomes completely inundated. The next day, Kasapo worries about him and comes in a boat—the only way to travel after such flooding. Sure enough, everywhere is covered by water except the Buddha's little jungle thicket, which remains completely dry. There sits the Buddha on the earth.

Seeing the boat above, the Buddha rises into the air and lands gracefully on Kasapo's vessel. And Kasapo responds exactly as before.

At this point, the Buddha recognizes it's time to change tactics. He thinks, "This foolish fellow will continue thinking like this for a long time." He decides he must put the boot in differently. So he says to Kasapo: "You are not an arahant, nor are you on the way to becoming one. There is nothing in your practice by which you might become an arahant or enter into the way of becoming one."

This time he verbally dismantles him. You're not an arahant—forget about it. And there's nothing you're doing that will ever get you there. You are wasting your time completely.

Now Kasapo finally cracks. He's convinced. Why does he break at this point? Because over the past twenty-four days, the Buddha has made it abundantly clear that he knows Kasapo's practice and can perform it much better than Kasapo himself can—effortlessly, in fact. If anyone knows where this practice leads, it would have to be the Buddha. Nobody could doubt that anymore.

Kasapo must have been deeply sincere in his spiritual aspiration, because he has much to lose. This man is a major spiritual leader with five hundred disciples, known throughout eastern India. Now someone is telling him that what he's doing is complete nonsense—that he's utterly deluded and will never reach enlightenment. But he's a genuine practitioner, and when he recognizes his error, he admits it. He surrenders and converts.

However, he must consult with his followers. He has students and feels responsible for them. So he approaches them: "This is the situation. I've decided I must convert. What do you think?"

They look at each other and respond: "We have long had faith in the great samana. If you lead the highest life under him, we will do likewise."

Of all five hundred ascetics, Kasapo was the last to understand what was happening. Isn't this typical of leaders? They're always the last to figure out what's going on.

The ascetics then took their hair, their dreadlocks, their belongings, and their implements for fire sacrifice, and dropped them all into the water to be carried away. They gathered everything from their ritual practice, shaved off their dreadlocks, and cast it all into the river.

The ascetics are abandoning a particular form of practice they now see as incompatible with the Buddha's way. But why put everything in the river? It's tempting to think they're simply throwing these things away—that this is all junk now, superstitious claptrap they once considered important but now chuck away in contempt for their past delusion as they march into the light of true faith.

But actually no, what they're doing is they're making an offering to the devas, quite respectfully. Remember the story about King Arthur and his sword Excalibur? Early in his career he received the sword from the Lady of the Lake, and that was the sacred sword he used throughout his career. When he was dying—I forget whether he threw the sword into the lake or ordered somebody else to throw it. Gawain, perhaps. So the sword is thrown. Gawain probably had no idea what was going on: "Why are you chucking away this sword?" It flies through the air, and before it hits the lake, an arm comes out, grabs it, and disappears. He's offering it back to where it came from. It's an act of respect, not contempt.

I think the ascetics are doing the same thing. They are not rejecting their gods. What they're doing is changing their practice. That's the big difference.

Buddhism absorbs. It does not simply reject. Classically, when Buddhism comes to a new culture, it doesn't say, "Right, you're all doing the wrong thing. Stop doing it right now. From now on, you do what we tell you to do." Rather, they look around: "Okay, these practices that you do—they're really good. Perhaps you could understand them in a slightly different way. These practices over there, they're not so good. They're akusala. They just lead to harm and suffering. You'd be better off without them. These gods you worship—keep worshiping them. Worship the same gods. There's no problem. These people you respect, you should continue to respect them."

So Buddhism absorbs. It doesn't fight against. It doesn't reject. And this is happening here.

You notice also how everyone takes for granted the existence of other worlds and that these worlds intersect with our world. The world of the Naga Raja, the world of the devas of the river and of the forests, the world of people—these are different worlds, and yet the worlds of the various gods, tree spirits, and so forth intersect. This is fundamental to the belief system at the time.

Anyway, all this equipment floats downstream and is seen by Nadi Kasapa, Kasapa of the river. When he sees this, he fears disaster has overtaken his brother. He and his students rush upstream to see what's going on, but everyone's there, everyone seems very happy—except they've shaved their heads and they're not doing what they used to do.

Kasapa of the river asks his brother, "Is this better, Kasapa?"

And Kasapa says, "It is."

So Nadi Kasapa converts along with his group. They do the same thing.

Meanwhile, the stuff is floating downstream. It turns up at the camping site of Gaya Kasapa and his followers. They go upstream. Same thing: "Is this better, Kasapa?"

"Yes, it is."

So they join as well.

Now there are—how many are we talking about? The numbers, of course, are symbolic. They're not literal. So five hundred is a very great number. Three hundred is a lot.

When you see these numbers in the Buddha's teachings, and this is typical of oral traditions, they're symbolic rather than literal. Two hundred is a lot, but not so much compared to three hundred or five hundred. But still, there must have been substantial gatherings.

Did the lay supporters come out and cook meals as they typically did for bhikkhus? We don't know the exact rules for these ascetics. It's possible they could cook for themselves, perhaps collecting uncooked grain to store and prepare when needed. One of the rules in the Vinaya stipulates that a bhikkhu cannot accept uncooked grain—it must already be cooked to prevent food storage. But we don't know precisely what rules these fire-worshippers followed.

What we do know is that India at this time was one of the wealthiest, most cosmopolitan, and sophisticated societies on earth. It could easily support large numbers of samaṇas and brāhmaṇas.

At this point, having converted them through his demonstration of power and superior shamanic abilities, the Buddha had not yet taught them anything at all. He takes them away from this area to Gayā-sīsa, a hill near Gayā. The surrounding area is flat plain, and in the middle rises this hill called Gayā-sīsa, the "Head of Gayā."

Taking them to the summit, he delivers the Ādittapariyāya Sutta—the Fire Sermon. This third discourse completes the trilogy. Notice the extraordinary preparation he undertook—softening them up for almost a month just so he could deliver the Dharma. And of course, being the Buddha, it would be Dharma perfectly suited for this particular audience.

Tomorrow night we'll examine that discourse—the third teaching. Tonight has been bedtime stories; tomorrow we delve into the profound teaching itself.

"You mentioned there was a famous passage about going forth singly, yet all the other accounts I've read show them always in groups. When did he change his approach?"

He might have changed it later when establishing formal rules. At this early time, there were virtually no rules. The regulations developed gradually over time—when someone did something inappropriate, they would establish a guideline against it. This was a period of minimum rules and maximum enlightenment.

There's another famous incident where, many years later, someone asked the Buddha: "When we started out, we had few rules and abundant enlightenment. Now we have countless rules and little enlightenment. What happened?" The Buddha essentially replied, "Yes, that's the way it is. That's how it's always been."

"Where does this fabulous story come from?"

The Mahāvagga, in the opening section of the Vinaya Piṭaka—I believe it's called the Mahākhandhaka. It begins with this history of the Saṅgha, containing the earliest layer of stories about how the monastic community began.

"There weren't many stories about the Buddha's magical powers, were there?"

No, in fact he later refuses to engage in such displays. From then on he was very discreet, but here he's wielding these powers freely. Again, it's this quality of shamanic power, that aspect of him emerging.

For example, when all this is finished, he goes to Rājagaha and establishes himself there. Then he receives an invitation from a wealthy supporter—Anāthapiṇḍika, the model of generosity—to come to Sāvatthī, where he would build a monastery. So the

Buddha moves to Sāvatthī, where he encounters King Pasenadi. To succeed in Kosala, he must establish good relations with Pasenadi, who was known as something of a volatile ruler.

And he has the first encounter and manages to convert him. But now the Buddha is quite young at this time and Pasenadi is also quite young. I think they're actually the same age. And Pasenadi arrives and says, "You know, so you claim to be fully enlightened. Well, a whole number of big time teachers have come through here because this is the most important part of the world, mate. And none of them—and these are old and venerable and respected teachers—none of them have claimed to be fully enlightened. Here you are, some young whippersnapper, nobody's heard of, just wandered into town and you claim to be fully enlightened. Why on earth should anyone take you seriously?"

And the subtext being: why shouldn't I just consider you a fraud, drag you off to prison and chop you in pieces?

And the Buddha replies something along the lines of: "There are four things that you must never underestimate because of their youth: a fire, a kṣatriya, a warrior, a snake, and a Buddha."

And so you've got Pasenadi who is not so subtly threatening him, and the Buddha comes back and threatens him even more. "Mess with me mate, and it will be a big mistake."

He's a mighty warrior himself and so he's sort of talking his language to him. He understands power. A bit of shirt fronting there. That's ritual shirt fronting. And the Buddha wins. And Pasenadi says, "Okay. I can see I've got a venomous young snake in my garden, and I will let him alone."

So this shamanic, powerful side of the Buddha—it's there, but it tends to be kind of not noticed so much. It's not exaggerated, but it's highlighted in Tibetan teachings, like the Mahayana teachings, the powers, the magical powers, the forces of floating gold and lotus and all that sort of stuff. Because they have a strong shamanic tradition. And again, Buddhism absorbs. It goes to a place with a strong shamanic tradition—it just buddhizes it.

Even in Zen, there's a shamanic tradition in Zen stories. It pops up there, but again, it's quite on the side. It tends not to be noticed.

"So Patrick, this term 'the Buddha'—that was an ideal before the Buddha was enlightened? They used that term?"

Yeah, they used the term *jina*. Mahavira, who was older than the Buddha, claimed to be fully enlightened. He was jina, the conqueror. But he was also buddha, awakened. But jina was the major title, buddha was a minor one. With the Buddha, buddha was his major title, but jina was a minor one. So he just took the same language. I think tathāgata would have been something he borrowed. So some of the basic terms he borrowed.

So this is part of the yoga tradition. You have shamans, you have yogis, you have ascetics. And you have whole groups of these people with this ideal of enlightenment. You have the Brahmin priests and they don't have an ideal of enlightenment. They just follow the law and control society as the way it should be.

So you have this tremendous multicultural variety at the time of the Buddha. All sorts of strange characters. And the Buddha kind of flowing among them and getting converts from all of these different parts of society and bringing them together under one roof.

CHAPTER 26

Burning - Ādittapariyāya Sutta

Patrick Kearney · 59 min

Patrick Kearney explores the Ādittapariyāya Sutta (SN 35.28), the Buddha's dramatic teaching on burning delivered to 1,000 fire-worshipping ascetics led by the Kassapa brothers. This discourse completes the trilogy that began Buddhism, following the Dhammacakkappavattana Sutta and Anattālakkhana Sutta.

The teaching reveals how everything burns through the six sense fields - the eye, ear, nose, tongue, body, and mind, along with their corresponding objects and consciousness. Each burns with the fires of lobha (greed), dosa (hatred), and moha (delusion), creating the dukkha of birth, aging, death, sorrow, and despair. The Buddha strategically reversed the fire imagery sacred to these ascetics, presenting nibbāna as the cooling and extinguishing of these fires.

Kearney examines the Buddha's radical empiricism - that everything knowable comes through the six senses, as outlined in the Sabba Sutta (SN 35.23). This embodied approach to practice emphasizes vedanā (feeling) and the immediate, physical experience of contact (phassa) between sense organs and their objects. The discourse demonstrates Buddhism's universality and portability compared to location-dependent ritual practices, marking it as potentially the first world religion. Through intimate awareness of the burning nature of sensory experience, practitioners develop disenchantment leading to liberation.

So tonight we arrive at the third formal teaching of the Buddha, the Ādittapariyāya Sutta, simply translated as "burning." This completes the trilogy. The Dhammacakkappavattana Sutta, setting in motion the wheel of the Dharma, starts the whole thing off with the middle way and four truths. Then we have the Anattalakkhana Sutta, the not-self characteristic, and finally this one.

We gave the back story about how the Buddha had a particular audience in mind. There was a particular group of people he wanted to convert—the dreadlocks ascetics who lived and practiced on the banks of the Nerañjarā River, which also runs past the Bodhi tree. When the Buddha was practicing asceticism while still the Bodhisattva, they would have been neighbors, so doubtlessly they knew each other. The Buddha zeroed in on one person in particular, the elder Kassapa brother, spending almost a month hammering away at him with demonstrations of shamanic power. Finally breaking down the resistance, he converted, and all the followers converted, so they were ready to be taught. This is what they were taught.

This is the opening section of the sutta. "Bhikkhus," he says, "everything is burning. And what is this everything that is burning? The eye sensitivity is burning, visual forms are burning, visual awareness is burning, visual contact is burning, and whatever feeling arises dependent upon visual contact, whether pleasant or painful or neither painful nor pleasant, that too is burning.

"Burning with what? Burning with the fire of obsession, with the fire of aversion, with the fire of delusion, burning with birth, aging and death, with sorrow, lamentation, pain, grief and despair.

"The ear sensitivity is burning, the nose sensitivity is burning, the tongue sensitivity is burning, the body sensitivity is burning, the mind sensitivity is burning, phenomena are burning, mind awareness is burning, mind contact is burning. And whatever feeling arises dependent upon mind contact, whether pleasant or painful, or neither painful nor pleasant, that too is burning.

"Burning with what? Burning with the fire of obsession, with the fire of aversion, with the fire of delusion. Burning with birth, aging and death, with sorrow, lamentation, pain, grief and despair."

So this is the entry. Everything is burning, and the everything are the six sensitivities, corresponding sense objects, and the corresponding awareness, as well as the feeling—the vedanā—that arises dependent upon them.

At the Buddha's time, it's sometimes said that the Buddha was a Hindu. The Buddha lived at a time before Hinduism, before what we know as Hinduism. What we have at the time was a Vedic tradition which had begun in the northwest, in what is now Pakistan, and was moving southeast along the Ganges Valley. There was also a whole series of other movements—old indigenous movements, new reform movements. New ideas like karma in our sense of the word were beginning to develop, and there was this whole burgeoning variety of philosophies and practices going on, a mixture of all these influences.

The dreadlocks ascetics were focused on fire worship, shamanism, worship of particular spirits and devas, and sacrifice. The use of sacrifice makes them similar to the Vedic orthodoxy. But they were not orthodox because they clearly believed in some kind of enlightenment which was not part of the Vedic orthodoxy at the time. Like the Bodhisattva and his companions, they practiced a form of tapas, asceticism, generating heat. Tapas means essentially heat. But they did so in different ways than the Bodhisat-

tva and his companions did. This is a different tradition. The worship of the fire, the use of the nāga spirit, the entry into the river on the coldest nights of the year—all indicate a different style of practice.

You notice that for the Vedas that practiced sacrifice and for these people, fire is very important and fire is good. It's the fire of the sacrifice. The early miracles that the Buddha performed all involved fire, columns of light and fire. This is meant to impress these people. The use of tapas, which means heat—you generate heat through your practice—so heat and fire are very positive images in this tradition.

But what the Buddha did was reverse that imagery, and he said cooling is good. You have the word nibbāna, or in Sanskrit and English, nirvana. That's a word coming from the going out of a fire, the cooling of a fire. So the Buddha reverses the imagery of the time. At the time, it was probably quite startling. This is something new. Fire is not good, but cooling is. The going out of the fire is good.

Fire becomes the problem and the extinction of fire becomes the solution. When the Buddha gives this sermon, he's throwing at them an image that they're very familiar with, but he's spinning it around, he's reversing it.

We've spoken before about how the Buddha would focus his teaching or aim his teaching at a specific audience. You can see in this discourse that this is created for Kassapa and his followers. Given that the Buddha knew them beforehand, he may well have thought this whole thing out long beforehand.

where you get the feeling that he was flying by the seat of his pants. This time he seems to have a strategy in mind.

These ascetics practiced with a felt intimacy with the elements—a very elemental style of practice, powerful and direct, focused squarely on the body. There was the labor of preparing the fire sacrifice, the ritual bathing, the ordeal of midwinter in the river, and so on. But this practice was also limited by its dependence upon very specific conditions, without which it simply could not be performed.

They had to have certain possessions. Any ritual-based practice requires the ritual implements—certain things you must have in order to go through the rituals. If you don't have them, you can't do the rituals. Certain places were equally important. This practice was very much grounded in that area, on that river, in that particular place—the sacred places of river and forest, because these places were home to the specific spirits invoked in the rituals. If you went away from that place, you'd have to start again because you'd encounter different spirits. It's a very location-oriented practice,

similar to Australian Aboriginal religion, where the spirits and holy places are tied to specific locations, and certain people have their dreaming around particular areas. Very geographically specific.

Plus you need supplies—wood for the fire, so you must be in a forest; water for the ritual bathing, so you must be at a river. It's very place and possession oriented. You have to do it here. You can't do it anywhere else.

The Buddha's approach is completely different. First, no special equipment is needed. In those days they didn't need even the equipment we have today, and what we use is quite simple, not hugely complicated. Maximum simplicity. Second, the practice is not limited to any special place. Meditation can be done anywhere. One is free to move anywhere.

Notice how these ascetics do not wander—they're locked into this particular place. The Buddha's students wander. They're not confined to any particular location. This was very important for them. In wandering, they could take their entire tradition with them and set up camp and practice wherever they were. They did not need any of the elaborate requirements these ascetics needed.

In other words, his approach to practice is marked by universalism. If you look at Buddhism as a religion, it's an excellent candidate for being the first world religion. It spread outside of India and took root in very different cultures scattered over vast distances. It's transportable, portable, universal—in complete contrast to these fire-worshipping ascetics.

So the first thing the Buddha does with these dreadlocked ascetics—notice they don't simply convert. They say, "You are a teacher." Then instead of saying, "Sit down and I will teach you," as he did with the five companions, he says, "Let's go for a walk." He takes them away from their sacred places to a hill sticking up out of a flat plain, far from their sacred river—pretty much the opposite location from what they're used to. In other words, he's more than telling them, he's showing them

You don't need your sacred places, you don't need the intervention of these spirits that you've been cultivating a relationship with all these years. Completely unnecessary. We're going to do something totally different here. And then he teaches them a felt intimacy with the elements.

Now this is something in common with what they were doing before, but it's a whole different approach. Previously, it was their relationship with the spirits and with the particular place that they were in. Here, the Buddha is saying, you don't need any of that. All you need is what you have, which are the six sense fields. And you have the six sense fields wherever you are. That's all you need.

You don't need spirits, you don't need sacred places, you don't need particular seasons. All you need is to cultivate a felt intimacy with the elemental qualities of experience. In other words, what you need in particular is an intimacy with vedana, which we talked about before—the realm of affect. And this vedana is intimately connected with the senses.

The Buddha has the term contact—phassa or samphassa. Usually translated as contact, but it comes from the verb phusati, to touch. We are touched by sense objects. The eye is touched by light. The ear is touched by sound. The nose is touched by odors, and so on. With that touch, there is feeling. And they are, as we talked about, inextricably linked. It's this that is the way into the practice, particularly for these ascetics. And in particular, through the body.

When the Buddha analyzes the human being—the self within her world—we talked about how he has two basic ways of doing this. One is the five aggregates, and the other is the six sense fields. Whenever he's talking about anatta, he talks in terms of the five aggregates. When he talks about entanglement in the world of affect, of feeling, he talks about the six sense fields.

You notice that out of the five aggregates, four of them are mental and one is physical. So it's a predominantly mind-oriented way of looking at the human being. In the six sense fields, five of them are physical and one is mental. This is a predominantly physical way of looking at the nature of the human being. The emphasis is on embodiment. This intimacy with vedana, with feeling, is cultivated primarily through body. The role of body in this practice is extremely important.

So the Buddha began by saying everything is burning. Everything. Now this "everything"—sabba—turns up in other discourses. There's one discourse which is extremely useful, the Sabba Sutta, or simply "Everything." The Buddha begins by saying, "I will teach you everything." Now if I went to a dharma talk and the person got up and said, "I'm going to give you a dharma talk on everything," I'd start feeling anxious about whether I'd get home in time for dinner. But in fact, this is a really brief discourse, and we'll just go through the whole thing.

"And what is everything? Eye sensitivity and forms, ear sensitivity and sounds, nose sensitivity and odors, tongue sensitivity and tastes, body sensitivity and tangibles, mind sensitivity and phenomena." So everything is the six sensitivities and the corresponding sense objects.

"Whoever says, rejecting this everything, 'I shall declare another,' if questioned on the foundation of his words, would be unable to explain and would also become distressed."

So if someone says, "Look, yes, the realm of the six senses is very important, but there is something else that's even more important because it's transcendental, it's spiritual," if questioned on the foundation of his words, he'd be unable to explain. What do you base this belief on? What's the foundation? And if challenged on this, he'd become distressed.

If we have a view, and when challenged, we become distressed, why do we become distressed? Obviously we're clinging to the view. But what are the views that we would tend to cling to most ferociously? The ones for which we have no foundation. Which we accept purely on faith. Which we've never actually investigated. So when someone starts to probe and starts to investigate, we don't know what to say. "But that's what the Holy Book says." But...

What makes you sure that that really is the Holy Book? What makes you sure that this version you have, this book that was several thousand years old—how do you know that this translation is correct?

This is one thing that gets up my nostrils with fundamentalist Christians who believe that the Bible is the literal word of God. How many of them spend the necessary time studying classical Hebrew, ancient Greek, and Aramaic to actually read the word of God? Because those are the languages God spoke in. Usually they don't—they just have some translation. How on earth do they know?

When I was at UQ during my PhD in Buddhist studies, my associate supervisor was a professor in biblical studies. He specialized in the book of Isaiah in the Old Testament, or the Hebrew Bible. He knew nothing about Buddhism, but he knew everything about studying ancient texts. So I used to hang out with the Old Testament crowd because they were really interesting. What they were doing was quite fascinating.

I remember one time he said, "There's one thing that every biblical fundamentalist has in common: they've never actually studied the Bible." Because, he says, if you read the Hebrew Bible, it's basically a massive storybook. And some of those stories are really, really weird. When you listen to the text being expounded by the fundamentalists, these are the stories they always avoid because they just don't fit the pattern.

So the Buddha is saying, "Well, let's go on. Why would the person become distressed?" Because it is beyond range, is what the Buddha says. But "beyond range" means beyond the range of the senses—in other words, beyond range of experience. So the Buddha is saying if you declare something else, whatever it is you're declaring is beyond experience, and there is no foundation for it except blah blah blah. It's only blah blah blah, and that's all it is, and that's all it ever can be.

The only firm ground to understand what's going on is experience. If there is something for us, if there is something beyond the range of human experience, we cannot know anything about it, and it is completely irrelevant to us. It's just meaningless. What we have is human experience, and human experience comes via the six senses. That's it. End of story.

This is the radical empiricism of the Buddha. So whenever the Buddha speaks about X, whatever it is, what he means is our experience of X. We touched on this when we were talking about life after life. He's more practitioner than philosopher. He does not get caught in metaphysical dead ends. He's just not interested in metaphysical questions. What he's interested in is the nature of experience. And given this, how should we live? That's it.

So this is empiricism, which of course in the European tradition we're quite familiar with—except that in the European tradition it only counts five senses, the physical senses. European philosophers don't see mind as a sense sensitivity or a sense organ. But for the Buddha, he does. He just sees it as obvious. It's a sensitivity to sense data. It's a sense, just like all the others. Well, it has its own peculiar characteristics, but it's just another sense sensitivity.

The Buddha's empiricism becomes radical when we give up any felt belief in that which is beyond experience. What would it be like to drop everything at all that was beyond experience? What would it be like to live like that?

Well, for example, do we experience our own past? We experience memories, which are creations of the mind, and these memories arise when? In the present. Now, do we experience the past? No. What do our memories tell us about the past?

What would it be like to give up any felt belief in the truth of our memories? That's an interesting question. We actually practice this when we do the meditation practice. If I'm distracted by memory, if I ask myself, "What is this memory telling me? Is it giving me information about the past?" Well, in practical terms, sometimes they say something useful, sometimes not. Memories can be useful. But what they certainly tell us is the state of the present. They tell us the present state of the citta which is producing them. That's what they tell us from the point of view of the practitioner.

So I might find myself obsessing about some painful traumatic event that occurred in the past. Now the power of the memory comes from the assumption that this is telling me something true about me and I am now. This memory is telling me something which is true about me now—my past. But when we become sensitive to the Buddha's radical empiricism, which we do when we do this practice relentlessly, just staying with present experience and seeing how it comes and goes, we learn to realize that actually what this memory is telling me is the current state of this citta right now. And that's all it's telling me. As such, it's very valuable.

So a painful memory comes back, I obsess about it. What this is telling me is that right now the citta is raw and vulnerable and being impacted by mental phenomena that's causing pain. And this whole event is being clothed in the story of my past. But all I can ever experience of my past are mental images that arise now. That's all. There is nothing else out there.

And similarly with the future. What would it be like to give up any felt belief in the future? To recognize in real time that the future does not exist. That all I have are images and associated sensations and feelings that occur now, and what they tell me is what's happening now. They don't tell me anything at all about what will happen.

So this is what the Buddha is getting at, particularly in this discourse where he's talking about the immediacy of the senses. This discourse, "Burning," is talking about the felt intimacy of experience, the touch of the world upon me. And this world is both external and internal. This intimacy of stimulus is always happening. There is never a moment that I'm free of it. It's always happening. This is not some kind of abstract third-person philosophy. This is a felt first-person teaching which is designed to bring the practitioner back to the feel of this right here and right now. What does this right now feel like?

So contact and feeling, touch and response—it's already happening. I don't have to do anything at all to make it happen. It's already happening. We are already responding. We don't have to do anything extra to respond. We're already doing it. So "Burning" points directly to that fact, with particular emphasis on its pain and drivenness.

Here the Buddha is really focusing on craving, tanha, the restless dissatisfaction that we experience at the heart of things—dis-ease. And this dis-ease is so subtle. When things are going well, we're having a good time, it's so subtle but so omnipresent that we've ceased noticing it. We notice our thoughts and our feelings blowing about in the wind, but we don't notice the restless, dissatisfied, vulnerable, sensitive quality deep within the citta itself at the point of impact—bang—when the object strikes the sensitivity.

So this teaching is all about a particular kind of practice, and the practice is all about intimacy with the immediacy of experience, the response to that, the vedana of it, whether pleasant, painful or otherwise, and the entanglement that occurs because of it. The way that we get entangled with whatever comes through the senses and get tied up with it. So it's about feeling our way into what's really going on.

So it's about sensitivity and receptivity. There's something going on beneath normal consciousness that is subtly coloring everything happening in consciousness. So what is it? What's going on down there?

Whatever it is, it's already here. And it's not a question of looking for it, as we mentioned with vedanā. If we look for it, if we have the idea, the concept, "Well, I have to look for this," that carries with it the assumption that it may not be here, it may not be discoverable. But it is already here. So it's not looking for it, but feeling, sensing what is already happening. And I think this attitude is quite important—this receptive openness to what we know is happening right now. But it's so immediate and so universal that we've stopped noticing it.

So as a practice style, I think this is—remember we did the exercises in "awareing," when we hold the meditation object very lightly, we become aware of the whole field. That's where we're practicing a more receptive quality of practice. And the next day we did restraining the senses, and there we practiced pure receptivity—just whatever comes. So the teaching on burning could be approached through that style of practice, and it can be particularly useful towards the end of a retreat.

So if we've been practicing, working very hard—note, note, note, note. And remember, noting is directed attention. I send the attention out, bang. I seek out the target, bang. Put the awareness on it. And it's an energetic, directed, kind of "out there" style of practice. Energy builds, concentration builds, mindfulness builds, everything becomes much more sensitive, the mind is much clearer.

Towards the end of the retreat, when it begins to register in the consciousness that it's not that far away until the end, then we begin to suspect that the Buddha's teaching on the non-existence of the future may well be false. *[Laughter]* Now he may have been right about the past, but I think he might have made a mistake about the future because it feels really, really real. Which of course is the imagery coming up fueled by the energy and the clarity and the power of the mind which has spent the past three weeks meditating. So the mind can create a sense of reality which is really strong, precisely because we've been practicing for so long. It's a very interesting phenomenon.

Often we might be tempted to think that the longer we go into the retreat, the fewer the distractions become. That is one trajectory, but you equally have the trajectory where it's not that the distractions disappear—it's that we get a much better quality of distraction. The mind is capable of just producing the most vivid imagery and realities because it's so much more powerful.

So to practice a receptivity—just to receive this—not to fight it, not to try to bury it. "I've got to note harder," or alternatively, "I'll just take a break, just forget about it." But rather start to open up and just receive, feel what's coming through all these senses. And in the case of our relationship to the future, of course it's the sixth sense—the mind.

In this scheme of the six senses, we pointed out the emphasis is clearly on body because it's five of them, and then you have mind as the sixth. Its role is twofold. One is—well, first of all, the five physical senses, I think we mentioned this before, they're like parallel channels that never intersect. So the eyes receive light and color; they do not receive sound. The ears receive sound; they do not receive light, and so on. So there's no intersection. There's five quite discrete channels of information.

And the mind also has its own discrete channel, that of what's called phenomena. This is a translation of dhammās. These are mental phenomena. Sometimes in the older translations you see it translated as mind objects or mental objects. So I can see the inside of this hall—that's physical, coming through the eyes. I close my eyes and I remember or imagine this hall—and that's purely mind, that's the mind channel.

So the mind has its own channel, plus it receives data from the five physical senses as well, and it brings them together in one place, as it were, and it creates a sensual unity. So it creates a felt sense of one place where everything is happening. So when we consider where is seeing, hearing, smelling, tasting and touching taking place, they take place here. So this practice emphasizes the here-ness of experience—even the here-ness of mind. Where am I conceiving myself and my world? Where is that construction of a world taking place? It's taking place here.

When we're lost in narrative, we lose that sense of here-ness. But when we practice with the six senses, we reclaim that sense of here-ness. And here is always now. The two of them go together. It's very much part of working with the senses—the here-ness of experience.

We talked about and played with tracking not-self, anatta, through narrative. So the mind creates the story of myself and my life. Tracking the six sense fields centers on feeling, not narrative. What is the feel of being here now thinking about the future? What is that experience? What touches me with that? How do I respond to that here now?

This practice is concerned with the world defined by affect, by vedana. It's more intimate than the world defined by narrative and fundamentally more real. Yet, paradoxically, it can be more difficult to notice.

We talked about the power of the mind, its capacity to create an alternative reality. And we are in the habit of living in those alternative realities. The practice of the six senses is all about this reality, including the mental reality—but the mental reality experienced as here, as now. So I'm imagining the future, but I have a clear felt sense that this is happening here, and it's happening now. It's not happening there and in the future.

And this practice—the ground of it—is in our relationship to the body. And again we come back to the role of the body, how important it is.

We gave the example of hanging out the clothes. Hanging out the clothes is very routine physical activity whose narrative power is very weak. So what we find when we're hanging out the clothes is we'll start to spin fantasies and we project our sense of reality there into the fantasies.

The practice of the sense fields entails deliberately staying tuned to the direct sensate feeling aspect of the activity. Is it routine? Well, it's only routine if I think about it, if I compare it to past and future. Oh yes, I've done this before. And once it's over, then I can do something real. That relationship can only exist when past and future are felt to be real.

But what if there really isn't anything except this peg? Then we start to get this direct sensate feeling aspect of the activity. This is where the practice of the sense fields takes place.

This is staying with the body, and again, this is one reason why we do the body work in the morning. It's a way of deliberately entering into the direct, immediate feel of the body and exploring it, exploring what is the nature of the sensation. Because the whole exercise is: where is the sensation this morning? Find it, stay with it, relax into it.

But there's also the direct sensate feel of the mind itself, which is available but much more subtle. So for example, thinking and fantasy, thinking about the future. But what about the direct sensate experience of the drivenness to think? What does that feel like? And the feeling of the unsatisfactory nature, the dukkha nature of this particular thought that I've generated—which I can see because I immediately rush to create another one. If this first one was satisfactory I would have stayed with it. But apparently it isn't because there's this rush to create another one and another one and another one.

What's underneath that and what's the feel of the driven quality of the need to produce all these thoughts? The restlessness and the agitation—this is part of the Buddha's fire imagery. It's hot in the sense that first of all we get emotionally entangled with it. So I'm driven to think of the future. I take it to be real, and then I get tangled up. I better arrange it this way. Maybe that's not the best way. I'll arrange it that way. That'll be really, really good. Oh, Jesus, that's really going to be good. It's going to be fantastic. How many days? Oh, it's going to be great.

But someone might screw it up. Oh, those bastards. I'd better handle that. I've got to figure out some way to prevent that from happening. Fueling, agitation, burning.

In the Satipatthana Sutta, when the Buddha talks about the six senses, he talks about understanding the sensitivity, the sense object, and the fetter—the sannyojana—that arises dependent upon both. So here he's taking a slightly different approach with the senses, but it's the same thing: the sense of stuckness and drivenness found in our relationship with the senses, the way we get caught up in them, entangled, stuck, unable to move beyond them, driven by them. And so we have this image of fire.

The Buddha's use of fire conveys restlessness and dissatisfaction and a sense of fascination. Isn't it interesting to watch a fire? It really draws the eye in. And it's constantly shifting and moving and going somewhere else—there's no rest in it, there's no peace within it. For the Buddha, what bliss comes from is the cooling of the fire. But in order to find that cooling, we've got to go directly through the fire. That's the only way there.

Let's look at another way in which the Buddha talks about fire, in the Aggivaccha Gotta Sutta—the discourse to Vacchagotta on fire. This is another fire sermon, this one given to Vacchagotta. He was a non-Buddhist ascetic who used to hang around and ask the Buddha questions. He asked very good questions and inspired some very good discourses.

In this particular discourse, Vacchagotta is interested in the nature of the awakened citta. When someone's awakened, fully enlightened, what's the nature of the citta there?

The Buddha says to him, "What do you think, Vaccha? Suppose a fire was burning in front of you. Would you know it was burning in front of you?" So you get this picture—they're sitting around, and imagine this fire right in front of you. Do you know that fire is burning in front of you?

"I would, Mr. Gautama." Vaccha is not a bhikkhu, so he doesn't say *Bhante*. He says "Mr. Gautama."

"If somebody asked you, 'Dependent upon what does this fire burn?' what would you answer?"

"I would answer, 'This fire burns dependent upon grass and sticks.'"

"If this fire was extinguished, would you know that it was extinguished?"

"I would, Mr. Gautama."

"If someone was to ask you, 'When that fire in front of you was extinguished, where did it go? To the east, the west, the north, or the south?' what would you answer?"

"That does not apply, Mr. Gautama. Fire burns dependent upon its fuel of grass and sticks."

Remember, fuel is *upadana*—we talked about this before. The translation of *upadana* is clinging or attachment. So it's fuel and it's also clinging or attachment. "Fire burns dependent upon its fuel of grass and sticks. When that fuel is used up and it does not get any more—no longer fed—it is reckoned as cooled."

So for the Buddha, the goal is for the fire to burn itself out. Everything is burning. What we have to do is become intimate with that experience of burning, and in that intimacy, stop adding to it. When we do that, the fire goes out.

And what can we say about that experience? If the fire goes out, well, you know that the fire has gone out. But what can you say about it? Here the question is: where has it gone? You've said it's gone out, so where has it gone to?

You can see that language doesn't cope. "That does not apply, Mr. Gautama." Language is being directed at something which it cannot cope with. The cooling of the fire represents something which is experienced as obvious—as obvious as "here, there's the fire," but now it's gone out. Bleeding obvious. Yet at the same time, it's impossible to put a concept on it. Whatever concept we put upon it does not apply.

It doesn't fit.

Did that aesthetic ever convert?

Yes, eventually.

Did you know what happened to him?

No, I just know that that particular questioning was around the mind of the awakened one. Where does it go after death? So that was a question about life after life.

You notice how the Buddha brings it back to here and now? Right now, with the fire's gone out, where has it gone? Because there's no difference.

So this is a practice which is immediate, it's physical, five out of the six senses. It has to do with the immediacy of experience and the feeling that arises, the ocean of affect that we all live in, our responses, and seeing—really being clear about those responses and exactly what is going on with them, and going through that fire.

And the fire implies dukkha. This is an image which conveys what the later tradition calls the dukkha ñāṇas. I think maybe tomorrow we'll talk about dukkha since one or two individuals have experienced it during this retreat. Once or twice. Not very much. Mostly it's been bliss. So we'll talk about that.

But through the fire to the other side, which is the going out of the fire. And this is the basic theme of the practice that the Buddha is presenting to the dreadlocks, the ascetics—although now there's no more dreadlocks. They've abandoned those in the rivers.

So he presents all this material about burning, and then he introduces disenchantment. Seeing in this way, the trained, cultivated student is disenchanted with eye sensitivity, disenchanted with visual forms, disenchanted with visual awareness, disenchanted with visual contact, disenchanted with whatever feeling arises dependent upon visual contact, whether pleasant or painful, or neither painful nor pleasant, and so on through the other senses.

And of course we talked about disenchantment in the Anattalakkhana Sutta. So from here on in, it's exactly the same as Anattalakkhana, but it's a different entry point. With the second discourse on not-self, the entry point is via the five aggregates. Here the entry point is the six sense fields.

And this illustrates an aspect of the Buddha's teaching and practices: there's any number of entry points. And basically the entry point for each practitioner depends on where their sensitivities lie. That's the way in. And of course sensitivity can also be associated with pain. So often the pain is the way in. It's the meditator's friend.

Is it?

Who said that?

That's what I've heard.

She's quoting Upāndvā.

As this explanation was being given, the hearts of the thousand bhikkhus were liberated from the taints by not clinging. So one thousand arahants. Bang. So you can see how the whole thing is escalating. The last discourse was five arahants. Then he had various people around Bārāṇasī. By the time he leaves Bārāṇasī, he's got sixty arahants. And now, he's done a lot of legwork over the past month. But whammo, he's got a thousand.

Is this only a month later?

Well, he spent time at Bārāṇasī, so maybe six weeks, two months.

So what was the time scale of this? How long...

First two or three months.

After the awakening?

Well, the two months after the awakening was the first discourse. So let's say this is maybe a couple of months later. So within six months, within the first six months.

So Buddhism is getting bigger and bigger. The Buddha's got this large community.

This community of 1,000 represented something extraordinary—these were very well-known and respected ascetics. This was 1,000 celebrities gathered in one place. What the Buddha does next demonstrates his remarkable strategic understanding: he takes them to Rajagaha, the capital of Magadha.

The arrival creates an enormous sensation throughout the city. All of these famous ascetics, particularly the three Kassapa brothers who were household names, have come to town together. This is completely unprecedented—they normally never travel as a group. And something is clearly different: they've all shaved their heads, which is seriously unusual behavior for them. There's also this other figure—a young man who seems remarkably close to these established teachers.

The texts tell us that people were genuinely confused, asking each other: Who is the student and who is the teacher? The elder Kassapa, understanding the confusion and recognizing the situation, makes a decisive public gesture. He prostrates before the Buddha, declaring unmistakably: "He is the teacher. I am the student."

In that moment, the Buddha is rocketed to overnight stardom in Magadha. He becomes the number one spiritual teacher in the kingdom—an unprecedented achievement.

You can see the Buddha's brilliant strategic mind at work. Having made that crucial decision perhaps six months earlier—"I must teach, there will be a few people who can understand this"—he has gotten onto a trajectory and now realizes something much grander: I can build an international spiritual movement. And that's exactly what he sets out to accomplish.

From this point forward, everything grows exponentially. His influence expands across kingdoms and cultures. His training as a member of the aristocratic class would have given him that strategic political understanding—he knew how power worked, how to communicate with influential people, how systems of authority functioned.

This aristocratic background, his experience as part of a republican ruling structure rather than a monarchy, profoundly shapes how he organizes the Sangha. The Buddha understood community organizing, the dynamics of leadership, and the principles of effective governance. All of this wisdom flows directly into his creation of the Vinaya and the revolutionary democratic principles that govern monastic life.

The spiritual genius and the political strategist were one and the same person, working in perfect harmony to establish a teaching that would endure for millennia.

CHAPTER 27

The Sweet Essence - Part 1 (Madhupindika Sutta)

Patrick Kearney · 56 min

Patrick Kearney opens a two-part exploration of the Madhupindika Sutta (MN 18), often called "The Honey Ball" but translated here as "The Sweet Essence." The discourse begins with the Buddha's encounter with Dandapani, a wealthy merchant in Kapilavatthu who questions the Buddha's teaching with an arrogant demeanor. The Buddha responds by addressing both the ethical dimension of non-argument and the deeper psychology of underlying perceptions (anusettī) that drive our conflicts and suffering.

When the Buddha's initial response proves too condensed for his bhikkhus to understand, Venerable Mahākaccāna provides a detailed explanation of how experience unfolds through the six sense doors. Starting with the natural process of contact (phassa) and feeling (vedanā), Mahākaccāna traces how we move from direct experience to perception (saññā), then to thinking (vitakka), and finally to proliferation (papañca) - the mind's tendency to complicate and elaborate experience beyond what's necessary.

This teaching reveals how we construct our sense of self and world through layers of conceptualization, moving from the immediacy of contact to being "harassed by concepts of perceptions colored by proliferation." Kearney emphasizes how feeling precedes and conditions all subsequent mental activity, challenging our culture's overvaluation of reason by showing how emotion actually underlies our sense of reality. Part 1 establishes the problem of mental construction; Part 2 will address the path to freedom from these binding patterns.

Tonight and tomorrow night we're going to look at the Madhupindika Sutta. Madhupindika is usually translated as "the honey ball," though I translate it as "the sweet essence." This is a quite famous discourse, and we're going to take two nights to unpack it. The talk is going to be abstract, technical, intellectual, obscure, serious, mysterious, and difficult. So you can all start taking a nap right now and just tune out.

Madhupindika—M-A-D-H-U—means "the sweet essence," and Pindika is P-I-N-D-I-K-A. This is number 18 in the Majjhima Nikaya.

Our story begins with the Buddha visiting Kapilavatthu, staying in Nigrodha's park outside the city. He's in the park meditating when a wealthy man, probably a merchant, comes walking through. This man's nickname is Dandapani. Danda means stick, pani

means hand—"stick in hand"—and he was called this because he was famous for his walking stick, which was made of gold. So he was wealthy, ostentatious, and quite well known, with an image of himself as being very interested in Dharma.

He's wandering through the park on his constitutional when he sees the Buddha sitting under a tree. He thinks this is the opportunity to ask a question. So he walks up, stands leaning on his walking stick, and asks, "What does the Samana teach? What does he declare? Here you are sitting under this tree—what's your teaching?"

The Buddha replies: "Friend, I teach so one does not stand arguing with anyone in the world, with its devas, its maras and brahmanas, its samanas and brahmanas, its rulers and peoples. I teach so that no perceptions underlie a brahmana who lives detached from desires, without confusion, with worries cut off, free from craving for any kind of becoming."

The first part of his answer—"I teach so one does not stand arguing with anyone in the world"—represents a quite typical move of the Buddha. He's asked what we could call a philosophical question, and he responds with an answer that belongs in the realm of ethics: how one lives. Basically, he describes the ethical result or expression of the teaching—how one lives if one is free from compulsion, free from drivenness.

This is important because for the Buddha, the teaching is always about how we live. That's what the Buddha is always interested in: broadly speaking, ethics. He creates theory, which can be quite elaborate—and we're going to go into it tonight and tomorrow night—but it's all about shedding light on how we live and changing how we live. It's all about ethics.

His first response is about ethics and is directed precisely at the situation in which he finds himself. Dandapani is standing, leaning on his stick—not very respectful. Incredibly disrespectful. You can tell that he's not a Buddhist when he doesn't address the Buddha as Bhante or the Blessed One. He says, "What does the Samana teach?" Samana means the reverend, the philosopher, whatever. But his attitude is very aggressive. He's standing above the Buddha, leaning on his stick, as if to say: "So, you down there, what's your trip? What are you on about?"

We don't know whether he realized who he was talking to. Maybe he did.

I mean, the Buddha was quite famous. But if you hadn't met him before, how would you distinguish him from any other person in rags sitting under a tree? And so the Buddha was alone—no, he was alone. And this is his hometown? Yeah, he visited a number of times. We don't know. We never know. All we get is that he's living in Kapilavastu. So we never know which visit it was. We don't know. Can't tell.

So the Buddha's first response is to turn Dandapani's attention inwards to his own condition. You pretend or purport to be interested in Dharma, and yet the way you behave indicates you're completely alienated from that interest. So what drives you? Why are you acting in this way? What is the source of your arrogance?

It sounds to me like he's saying, why are you spoiling for an argument? Because the Buddha says, I don't argue. But why do people argue? What's underneath that? And so the first sentence is about ethics and the second one is what we might call depth psychology. Now the Buddha goes into the depths of the psyche—why it is that people live in conflict.

So he says, "I teach so that no perceptions underlie a Brahmana." This is a Brahman, but here it would mean practitioner, not a member of the Vedic priesthood. So no perceptions underlie a Brahmana living detached from desires, without confusion, with worries cut off, free from craving for any kind of becoming.

So the Buddha moves into the underlying source of what moves us, what shapes our chosen way of life. And here he's saying we are formed and moved by the underlying perceptions. I teach so that no perceptions underlie someone who lives appropriately.

So here we have the first technical term. There's a number of technical terms in this discourse: underlying perceptions. First of all, perception, which we've mentioned briefly. Perception is the recognition of a situation as being familiar. So perception gives us our familiar, meaningful world. It creates our sense of normality. And what we perceive, we take for granted as being real, what's really out there. And perception is habitual. It's a product of repetition from the past.

So, for example, if you hear someone speaking in your native language, you just hear them giving you a message. But actually what the ears hear are a whole series of sounds, and it's the perception that turns it into a message. We recognise those words as containing these meanings. But if it's our own language, it's so deeply habitual that we don't even recognise it happening. We just hear the meaning. So it's a shortcut.

If you ever try to learn a second language, you discover how much work and how much time and effort it takes to develop that perception. It's not to be taken for granted. But because perception is habitual, in fact we do take our perceptions for granted. We don't look further. We don't investigate what underlies our perceptions and above all we don't understand that our normal everyday perception is a product of drivenness and delusion and therefore cannot be trusted. So this is the Buddha's perspective.

Actually, one example about perception—how it works in a meditation retreat—it hasn't happened here but often if you're teaching Dharma to a group of meditators, sometimes you get the challenge that comes up which clearly in the mind of the challenger is a brilliant, profound and unassailable challenge, and they say: "Ha ha, but what about the real world? What about that? What about the real world?"

Well, this "real world" is the product of perception. What the person is talking about is their habitual perceptions. And that's what appears to us to be real.

And it's usually for most people not to be questioned. If you do challenge these habitual perceptions, often the response will be aversion.

Underlying perception, or anusetti, refers to the deepest and most habitual movements of what we would call the unconscious mind. The Buddha talks about the anusaya, the underlying tendencies. This is the closest that he gets to talking about what we would regard as the unconscious mind.

The underlying tendencies are the potentialities deep within the heart-mind. They represent a potential for something to happen, something to arise, given a suitable trigger. If you're a long-term meditator, you might have had the experience of feeling that you've definitely grown out of some particular obsession. Then years later you're meditating away and suddenly—bang! There it is. You think, "That has been skulking in the background for the last ten years, and now here it is. It hasn't disappeared."

This might be an example of the underlying tendencies. Actually, it hasn't been skulking down there. It's a potentiality, not a real thing. But there's this potential, this pattern, such that given the appropriate conditions coming together, this will arise, this will pop up. These are the anusaya, the underlying tendencies.

Here the Buddha is talking about the underlying perceptions—the deepest, most habitual, most unconscious way in which we perceive ourselves and our world. What he's drawing attention to is the fact that we do not see these underlying forces. These underlying tendencies dominate the way that we live. They dominate what we think is going on, who we think we are, who we think other people are, and what we do about it.

What gives them their power is the fact that we don't see them. They're invisible. We are like puppets on strings, and of course what makes a puppet a puppet is the fact that they don't know that they're puppets. They don't know that they're being manipulated by the strings. We are being manipulated by these underlying perceptions. They are the deep habits that create our sense of reality, of normality, and they're associated with craving, drivenness, and delusion.

That's clear enough, isn't it? Not too complicated?

So awakening is being spoken of as a life in which no perceptions underlie the practitioner. There are no perceptions, no underlying perceptions. Nothing underneath the surface that's skulking and ready to jump up and condition us. For the practitioner who is in that condition—for whom there are no underlying perceptions—lives detached from desires. This means a life that is no longer driven, no longer obsessed.

But to find this we have to penetrate beneath surface appearances. These are very deep, and to get to them, we've got to go very deep to expose them.

Basically, what the Buddha has just done—if you think about the situation—is this: he's minding his own business. This arrogant fellow comes up, stands over him, treats him disrespectfully, and asks him a question. The Buddha, as they say in the Zen world, opens his mouth and shows his liver. He just gives him the whole teaching all at once—hits him with the full blast of the Dharma.

This is very interesting because he would not have done this unless he had seen some potential in Dandapani. For all this surface arrogance, there was someone who had the potential to be moved by the teaching. Otherwise the Buddha wouldn't have bothered with him.

So Dandapani actually does have some potential, but he is not interested and he walks off. I have to look up the sutta again, but he kind of waggles his eyebrows and twirls his stick and strolls off. Basically, I think his response would have been, "I've got absolutely no idea what you're talking about and I'm out of here."

Dandapani blows it. He blows his chance to be transformed—not because of his initial arrogance. The Buddha accepted that and addressed it directly. But he blows it because of his failure to stay and ask a question. He didn't stay and say, "Okay, you've just taught me something and I have no idea what you're talking about. Could you explain it to me?" He responds to his own inability to understand what's going on by concluding this is not worth taking seriously and walking away.

This is quite a common reaction.

It's very easy when faced with a situation like this to walk away. It's the easiest thing to do.

So in the evening the Buddha comes back home. The way that they would live, they would camp out somewhere. In the morning after the alms round they have the meal and then they go out and scatter and people do their own practice. They come back in

the evening and they share stories, Dharma talks, questions and answers and so on, have a social time and then crash out for the night and get up early in the morning and head off to alms round and so on.

So the Buddha comes home in the evening and he tells the bhikkhus the story of this encounter and he repeats what he's told Dandapani: "Friend, I teach so one does not stand arguing with anyone in the world. I teach so that no perceptions underlie a practitioner who lives detached from desires, without confusion, with worries cut off, free from craving for any kind of becoming."

But it turns out that it's not just Dandapani who is confused. The bhikkhus have absolutely no idea what the Buddha is talking about. None. This goes straight over their heads. But their response is quite different. They actually ask for an explanation. Could you expand on this? Could you explain what's going on here? And so the Buddha does.

You get the second teaching: "As for the cause through which we are harassed by concepts of perceptions coloured by proliferation, if there is nothing there to delight in, welcome and hold to, just this is the end of the underlying tendencies to obsession, aversion, views, doubt, conceit, desire for becoming and delusion. Just this is the end of turning to violence and weapons, to quarrels, fights, disputes, recriminations, malicious words and false speech. This is where these evil, unwholesome states cease entirely."

So this is the Buddha's expansion on his initial teaching. First of all, the idea of the underlying perceptions—these have been expanded into concepts of perceptions coloured by proliferation. *Papañca saññā saṅkhā.*

So we've seen that perception is what gives us our normal everyday world. It gives us our sense of normality. Once we think we know what's happening in the world or in any given situation, at that point we stop paying attention because we already know. This is why it's so easy driving a car to space out. Because I know how to drive the car. Compared with my first driving lesson when push this, press that, turn this, look here—so I really have to pay attention. But once it's habitual, I can just turn off and think about something else and just do it.

So this is perception. Once we decide we know what's going on then we don't look again because we think we know.

Now this is where perceptions become concepts of perceptions. So perceptions already freeze the world but then they get doubly frozen through concepts of perceptions. And the concepts are even more frozen and more divorced from what's actually

happening than the perceptions. And these concepts are closely associated with *papañca*, usually translated proliferation, could also be translated as complication. And we're going to look at this later.

Now, the Buddha addresses the cause or condition. As for the cause or the condition through which we are harassed by concepts of perceptions coloured by proliferation, the term he uses here is *nidāna*. And the bhikkhus would instantly recognize this term. This is a key technical term, and it's always used in the context of dependent arising.

Dependent arising is all about conditionality. If something is happening, something else is conditioning it. And we've been talking about this in the practice all the way through. So we've been saying if I'm investigating an experience, one way I can do it is I can ask the question, what's feeding this? So what's happening to cause this? Something is happening, or something else must be happening to stimulate this. Otherwise this would not be happening. And in turn, what does this feed? If I cultivate this, what's the result? There will be a result. So what is it?

So when we ask what feeds this, in technical terms, we're asking what is its *nidāna*?

When we ask what feeds this, in technical terms, we're asking what is its *nidana*. And when we ask what does this feed, we're asking what does this function as the *nidana* for.

So *nidana* introduces the idea of conditionality. A *nidana* is something which is caused by something else and in turn causes something else. A *nidana* is something which is caused by something and in turn causes something else. So it's part of this network of conditionality. And as soon as the Buddha drops in this term, everybody knows he's talking about dependent arising.

So as for the cause or the condition through which we are harassed by concepts of perceptions colored by proliferation—what's causing this? How does this flow?

"If there is nothing there to delight in, welcome and hold to, just this is the end of the underlying tendencies to obsession, aversion, views, doubt, conceit, desire for becoming and delusions."

If there is nothing there to delight in—remember we talked about delight before when we were talking about craving? *Nandi*. Delight is the gratification that comes from satisfying a desire, but it's always associated with agitation. It's like, "That was good, I've got to do it again." So it's stimulated, excited, agitated, and it seeks repetition. Once is not enough. Twice would be better. Twice was good, but another would be even

better. So seconds were very good, but I've got to go back for thirds. The thirds were great, except it's getting a bit heavy, but I'll try the fourths. Damn it, it's all gone. These greedy bastards were ahead of me.

So this is delight, and it's always associated with restlessness, agitation, and therefore repetition. So it's actually painful although it feels like it's good, but if we look at it closely, it's actually painful.

And holding—"If there is nothing there to delight in, welcome and hold to." Holding indicates the state of being stuck. Can't move on from it.

When the Buddha says, "if there is nothing there," the "nothing"—well, what he's talking about so far is the process of what we've called the constructed state, the flow of constructed and conditioned events, *samsara*. When he says, "if there is nothing there," that nothing indicates the unconstructed, the not-born, the not-become, *nibbana* itself.

So in this teaching, in this bit, he says: As for the cause through which we are harassed by concepts of perceptions colored by proliferation, if there is nothing there underneath it, then that's it. No more problem. Colored by what? Colored by proliferation or complication. We're going to get to proliferation later on.

Is this making any sense at all? If it's making sense, you're way ahead of the *bhikkhus*, because the *bhikkhus* are still completely confused and they still don't know what's going on, except that they're too embarrassed to say so because the teacher has just explained it to them and it's kind of disrespectful to say, "Mate, we've got no idea what you're talking about."

I find that a little bit strange. Some of them would be fully awakened. Maybe these were particularly dull because they get scalded later on. But not by the Buddha. It could be the newbies. He could have just ordained a new bunch. It's quite possible. Isn't it even possible though that *arahants* who aren't particularly intellectual wouldn't grasp it? Yes, that's quite possible too.

So the Buddha, having explained this, gets up and leaves. He goes into his hut, settles down for the night. But the *bhikkhus* are left with this problem that the Buddha has just given them a teaching and it sounds very profound, but they've got absolutely no idea what it's about. So they need someone to explain it to them.

"Who will expound this in detail?" they ask. And so they decide upon Venerable Mahakaccana, who is in part of this camp because of all the disciples, Mahakaccana was the most skilled in explaining in detail what has been taught in brief.

And this actually introduces us to a basic structure of the Buddhist teaching. Often you get teachings which are very brief and need to be unpacked, which is what we do in these dharma talks. So this is commentary. And the process of commentary would have begun in the Buddha's lifetime—here we see it. We see an initial teaching, very brief, condensed! Then we see it unpacked and expanded—commentary. And then we're going to see this one expanded and unpacked even more—commentary on the commentary. This is typical of the Buddhist traditions.

Much of the intellectual firepower over the past two and a half millennia has been devoted to unpacking these teachings and explaining in detail what has been said in brief. As you can already tell, the suttas are often very compressed. It's like they're composed in shorthand, meant to be unpacked. The Sanskrit term sutra (sutta is Pali), and later on, centuries after the Buddha, this system became highly developed among literate Indians. You would compose a sutra absolutely packed with meaning—in fact impossible to figure out without a commentary. The person who composed the sutra would also compose the commentary. A classic example is Patanjali's Yoga Sutras, if you've ever looked at them.

So the bhikkhus go up to Venerable Mahakachana, tell him the whole story, and ask him to explain what's going on. What's the first thing he does? He scolds them. "You had the Buddha sitting right in front of you. You could have asked him, but you've come to ask me? What is the problem with you people?" The bhikkhus are all embarrassed and shamefaced, but they say, "Well, what to do? He's gone and you're here, so could you just explain it?"

So Mahakachana says, "Okay, okay." And this passage is particularly famous, often commented upon. Mahakachana says, "Depending on eye sensitivity and forms, visual awareness arises. The meeting of the three is contact. Contact conditions feeling." Have you heard this before? Yes, Monday. So we've gone through this before.

And then he adds: "What we feel, we perceive. What we perceive, we think about. What we think about, we proliferate. Because of what we have proliferated, we are harassed by concepts of perceptions colored by proliferation, regarding past, future and present."

He continues: "Depending on ear sensitivity and sounds, depending on nose sensitivity and odors, depending on tongue sensitivity and tastes, depending on body sensitivity and tangibles, depending on mind sensitivity and phenomena, mind awareness arises. The meeting of the three is contact, contact conditions feeling. What we feel, we

perceive. What we perceive, we think about. What we think about, we proliferate. Because of what we have proliferated, we are harassed by concepts of perceptions colored by proliferation regarding past, future and present."

So this is the teaching which we'll go through. Of course it goes through the six sense fields which we talked about last night—and the six sense fields are all about the immediacy of experience and the feeling that is always part of that immediacy. The realm of affect, of stimulus and response. We are touched by something and we respond. That's built in.

So depending on eye and forms, visual awareness arises. The meeting of the three is contact, contact conditions feeling. We are moved to do something, to respond, before we make any kind of choice about it.

It's just automatic, it just happens. And so this is at the very basis, this is ground zero of experience. What Mahakachana is describing here is natural process. There's a sensitivity, there's a corresponding object, there's the corresponding awareness. They meet and feeling arises. This is just natural process.

It's not good, it's not bad, it's just nature. Today it's been raining. Previously it was sunny. It's not good, it's not bad, it's just nature. It's just what happens. That's it. There's no problem and there's no person who has a problem. It's just natural process.

Then the second sentence: "What we feel, we perceive. What we perceive, we think about. What we think about, we proliferate."

The first thing you notice is that here, someone has just appeared. There's no "us" in the first sentence. There's a sensitivity, a sense object, awareness—bang, they come together, feeling. But in the next sentence, there's someone there who is feeling. Someone has just appeared. This is the self. "What we feel, we perceive." So it's no longer physical and mental events arising and ceasing. It's someone who is feeling and perceiving.

From feeling comes agency. There's someone around. There's someone doing something. And from feeling comes perception. So our recognition of what's going on, of our familiar world, emerges out of our affective responses, or we could say, speaking broadly, our emotional responses. They are what create or condition the perceptions.

In other words, first comes the heart's response, then comes the head's understanding. First comes what we would, in our culture, normally call emotion. Then comes reality. I think this is a very important principle, particularly in a culture which overvalues reason. We're all supposed to be operating on reason. Fine. Except reason is based on emotion. So if we don't address that, the reason is skewed.

So what we feel, we perceive. What we perceive, we think about. We are presented with a world that we recognize, that is familiar, that makes sense. And then Mahakachana says this includes vedana, so we're already responding, we're already engaged, but we don't leave things there. We need this world to mean something, and so to create meaning, we start thinking about the world, about this world which is created by feeling and perception. So we start thinking about what we perceive, our normal perceptions.

Have you ever done that? Once or twice, perhaps? So what we perceive, we think about. Now we're creating this world of concepts that sits on top of the perceptions. We've got the contact, the feeling, the perception, and on top of that, the thinking.

What we think about, we proliferate. Or we complicate things. This is papañca.

And this is the mind going into hyperdrive in its determination to read more into the experience than is necessary or even useful. Have you ever thought about something much more than was necessary or useful? This is proliferation. This is papañca. Complication.

We do this because we're driven by affect, by feeling, and everything that comes with it. So this proliferation creates a world which is distorted, complicated, and a product of craving and delusion.

We've got two steps in. And then the third sentence: "Because of what we proliferate, we are harassed by concepts of perceptions colored by proliferation regarding past, future and present."

Notice in the second one, we feel, we perceive, we think. There's someone there making choices. There's agency. We are doing something. But when the process matures in this third sentence—"because of what we proliferate we are harassed by"—we are no longer doing it. It's happening to us. We are now the victims of circumstances beyond our control.

Have you ever had that feeling, that sense, as thoughts are rampaging through the mind: "I'm not doing this. This is happening to me. If I had any choice in the matter I would stop, but I don't"? This is what Mahākaccāna is talking about. We're completely driven by forces out of our control in a world that seems separate and alien from us. This is our normal everyday world in which we live.

What dominates now are concepts—in Pali, saññā—and these are fixed ways of experiencing and labeling the world. What's happened is we've lost touch with the directness of experience and we're living in a world of shadows. Notice that we're no longer in a world of perceptions, but in a world of concepts of perceptions. There's an extra layer put on top of the perceptions.

The perceptions themselves are already the product of habit. But now on top of that there's an extra layer—concepts of them. So there's even more alienation. It's like a kind of cling wrap that covers everything.

Sometimes meditators will have the experience that they're trying to do something really simple, like follow the breathing, for example—directly experience the body and the mind—but we find ourselves somehow not connecting with it. It's like there seems to be some barrier. "I feel out of touch, separated somehow from the experience, isolated, not completely with it."

Sometimes we don't even notice this until somehow we stumble into an experience where we're genuinely intimate with the experience. We're simply with it. "Wow, this feels good." And then we lose it. And then we realize just how alienated and separated we normally are from simple experience.

So these are the concepts of perceptions, colored by proliferation. Does that make sense?

"What did you call it before? Did you call it saṅkhāra?"

Saññā. The concept is the translation of saññā, which is very similar to saṅkhāra. It's a different... S-A-N-K-H-A. From the same root, saṅ with khā.

This is an old Indian technical term that the Buddha would have inherited. It's an old term, a pre-Buddhist term. It basically means classification, enumeration, classifying, conceptualizing, analyzing—making sense out of something through some kind of system of classification. Here it's being used in a general sense of concept.

"Patrick, where do the unconscious potentialities sort of seep into that hierarchy of proliferation?"

They're way at the bottom. That's part of the dependent arising—that there are certain things operating so deep that they're generally invisible. In the standard formula of dependent arising, there's a standard twelve-fold formula, and the Buddha says delusion conditions constructions, constructions condition awareness.

So with awareness, we see what's going on. At the bottom is delusion. These conditioned constructions, and this process of the delusion conditioning the constructions—this will be down in that subconscious level. And what we get is the finished product. We get a sense of something happening at the level of awareness. But there's already something going on before we get to it, before we notice it.

You can tell that in your meditation practice. It's like there's something under there. We talk about going deeper in the meditation. It's like taking that awareness and going deeper down and then noticing things that previously we never saw, that were unconscious.

"Because of what we proliferate, we are harassed by concepts of perceptions coloured by proliferation regarding past, future and present." You notice that with concept we have a world of experienced time. Past, future and present appear now at this point with concepts. This is what the Buddha calls permanence, and only concepts provide permanence.

So let's take proliferation, papañca. Let's say I'm sitting meditating and my mind is in a spin. It's just pouring off thoughts. Now for this group, obviously you have to just imagine that there are some meditators who undergo this. Obviously you can't call upon direct experience, but just imagine that someone's going through this process.

This process is the manifestation of impermanence. It's a very good manifestation of it. It's constantly changing. It's constantly moving. It doesn't stay still for a second. So the proliferation is directly experienced as change.

But the concepts created by the proliferation are perceived as permanent and containing time. "It's always been like this for me. I always thought this was going to happen and now it's happened and it's going to be like this forever." So we have time—past, future and present—but it comes about through the concept.

The experience itself is just right now and it's changing all the time. But the concepts of the experience tell us, no, this is all about what's permanent. This is all about what happens, what survives from the past going through the present to the future.

So I'm lost in thought. The actual experience is constantly dancing and changing. What's permanent is the concept about it. "I always get lost in thought and it's always like this." Does that make sense? So where there's concept, there's time. Where there's no concept, there's no time.

What Mahakaccana is presenting here is how it happens that from the natural process of the immediacy of experience, the mind creates, gets into this process which ends up with our minds running completely riot. Our minds are totally out of control and therefore our lives are totally out of control. And we're lost in drivenness and delusion.

So what Mahakaccana has done is give a particular view of how the constructed world of the constructed is constructed—of how it works, how we built it. So we have built this world in which I'm here and I've got a problem and this is the real world and I'm stuck because this is reality, this is normal, this is me. He's laid out how we create the problem, and then he starts laying out how we create the solution to the problem. We'll look at that tomorrow.

"I've noticed in my environment that we spend so much time thinking that concept, when we skipped over perception and gave that just hardly any attention, jumped over it to then get lost in the thinking about what's not there."

Yes, because it's so familiar. We talked before about the power, the attraction of narrative—the narrative power of an experience. And we tend to go for the drama, basically. We like the drama. Something nice and juicy to chew on. Exactly. And especially when the result is so satisfactory. Viz me.

"Would it really be possible to exist and live just with pure perception? I mean, we kind of need procedural memory..."

We'll get to that tomorrow. So let's have those questions tomorrow, because this is Mahakaccana. He's laid out the problem. Tomorrow he'll lay out the other side.

So tonight he's been laying out the *sankhata*, the constructed, and tomorrow he'll lay out the unconstructed. So we get a sense there. So did they understand the six dimensions? Well it's not over yet. We'll find out tomorrow.

I think all the wisdom traditions have some story like this. This is interesting because of the psychological structure of it. It's very detailed.

You asked if from feeling comes agency—is that a kind of chicken and egg problem? Do you need agency to have feeling? Feeling precedes agency for sure. It precedes everything except the actual touch. And it precedes meaning as well.

The other question was about the unconscious—if it's what we don't know we don't know, is the process of meditation really just looking at the coloring? You mentioned perceptions having a coloring—coloured by perception, coloured by proliferation. So is it about becoming more sensitive to that coloring?

Yes, becoming more sensitive to what emerges out of the unconscious. As you say, if it's unconscious we don't know. But what the Buddha pays attention to—the Buddha does not pay attention to the unconscious because it's not part of empirical experience. He's only interested in empirical experience.

What we know is this arises and it ceases. We can expand that: this arises when that arises, and this ceases when that ceases. So remember the model of the four truths? There we had craving and *dukkha*. So what we have is what arises into view, into awareness and how that plays. That's all we've got. That's all we can ever have. If what's underneath is—who knows?

So he doesn't actually say there is an unconscious mind, because there's no empirical basis for it. What he says is you can experience the fact that there are these deep potentialities because sometimes, bang, something comes up and you realize, "Oh, I was caught in that fifty years ago." And it's happened in the same way.

And this is the Buddha's radical empiricism. If it's beyond experience it's just not going to go there. Whatever you say about it is just blah blah blah. So don't even waste your time.

I told you it would be abstract, technical and obscure and I was right. Thank you very much.

CHAPTER 28

The Sweet Essence - Part 2

Patrick Kearney · 1h02

> *In this second part of exploring the Madhupindika Sutta (MN 18), Patrick Kearney examines Mahākaccāna's profound teaching on the process by which we create suffering through conceptual proliferation (papañca). The discourse reveals how we begin with immediate sense contact—the meeting of sensitivity, sense object, and awareness—but then layer on concepts, perceptions, and thinking that ultimately trap us in a prison of our own mental constructions.*
>
> *Kearney explores the technical terms ṭhāna (ground) and paññatti (concept), showing how every experience requires a foundation but how we mistakenly take these conceptual grounds as solid reality. Through examples from Zen stories and meditation practice, he illustrates what it means to experience without adding conceptual overlays—the "cleanness" of bare attention where concepts are used as tools rather than mistaken for reality.*
>
> *The talk addresses practical questions about labeling in meditation, planning, and memory, demonstrating how awakened action can be spontaneous and effective without the burden of self-consciousness. This exploration of dependent arising (paṭicca samuppāda) and emptiness (suññatā) offers profound insights into the nature of liberation—the "sweet essence" that is paradoxically no essence at all.*

Last night we explored the first part of the Madhupindika Sutta, "The Sweet Essence"—one of the more challenging yet fascinating discourses. We began with the Buddha meditating when Dandapani approached him with arrogance and aggression, questioning his teaching. The Buddha responded with the full force of his wisdom, but Dandapani, not understanding, simply rejected what he couldn't comprehend and walked away. Rather than pausing to ask questions and seeking understanding, he chose dismissal.

The Buddha returned home and recounted this encounter, including the teaching he had given. The monks, unlike Dandapani, acknowledged their confusion and asked for clarification. When they still didn't grasp the meaning after his expansion, they approached Mahakaccana, who was foremost among the disciples in explaining in detail what had been given in brief. After gently scolding them for not pressing the Buddha further, Mahakaccana offered his famous exposition.

He systematically examined each of the six senses, but let us focus on the final one: mind. "Depending on mind sensitivity and phenomena, mind awareness arises. The meeting of the three is contact. Contact conditions feelings. What we feel, we perceive. What we perceive, we think about. What we think about, we proliferate. Because of what we have proliferated, we are harassed by concepts of perceptions colored by proliferation regarding past, future and present."

Essentially, Mahakaccana illuminated the process by which we begin with elemental experience—occurring right now through all six senses—and then follow a trajectory that creates a kind of prison through obsessive conceptualizing. We cling to these concepts and mistake our ideas about what's happening for what's actually happening. We construct a prison from our concepts, driven by completely uncontrolled proliferation—the mind simply spewing forth endless mental formations. We lose touch with the world of direct experience, living as though in a dream without recognizing we're dreaming.

After mapping this process of entrapment, Mahakaccana explained the path of awakening from this dream—which is our focus tonight.

This represents a central aspect of our practice. What we do is study our dreams and observe ourselves creating them, thereby constructing our prison—what we consider normal, what we take to be real, and the limitations each of us experiences within this supposed reality. Through becoming truly intimate with this entire process of creating a self—an imprisoned, suffering self—the very act of seeing clearly begins to dismantle it. Cracks appear in the edifice, and we can work with these openings, gradually teasing them apart until the whole structure begins to collapse.

The ultimate process, which we'll explore fully, doesn't eliminate concepts entirely, for they remain fundamental to navigating the world. The crucial difference lies in understanding that a concept is simply a concept. Think of a concept as a sign in front of a building. Outside this center stands a sign reading "Blue Mountains Insight Meditation Center." Are those words themselves the Blue Mountains Insight Meditation Center? Certainly not—they never could be; it's impossible. Yet does this render the sign useless? Not at all. The sign serves its purpose perfectly, especially for first-time visitors driving along the street who see it and think, "Ah, Blue Mountains Insight Meditation Centre—this is the place."

Concepts are both useful and necessary, but from the Buddha's perspective, to fulfill their true purpose, we must understand their real nature. We need to recognize that a concept is a concept, and what it points toward is something else entirely—something different.

Mahakaccana began this inquiry into what lies beneath what we think is really happening.

In other words, what do we find underneath the concept, underneath the dream?

Mahakassapa continues his analysis, and you'll notice that his entire inquiry in this sutta is based on the six sense fields. He's still using this fundamental template.

He says—and he does this for each of the sense fields—when there are eye sensitivity, forms, and visual awareness, we find a ground for conceptualizing contact. So if you have eye sensitivity, you have visual forms, you have visual awareness, that's where we find a ground for conceptualizing contact.

You notice he doesn't say the meeting of the three is contact. He's coming at it from a different angle. The standard teaching says the meeting of the three is contact. But here, Mahakassapa is saying where you have those three things, you find a ground for conceptualizing contact.

And then he goes on: where there is a ground for conceptualizing contact, we find a ground for conceptualizing feeling. Where there is a ground for conceptualizing feeling, we find a ground for conceptualizing perception. Where there is a ground for conceptualizing perception, we find a ground for conceptualizing thinking. Where there is a ground for conceptualizing thinking, we find a ground for conceptualizing concepts of perceptions colored by proliferation.

So you get this multi-layered cake, which he's gone through before, but now he's looking at it from a different angle. The first layer, the second, the third, the fourth—boom, boom, boom. Previously he was talking about it from the perspective of how we create a person who is a victim of circumstances beyond their control and is harassed, endlessly harassed by these proliferations, caught in self, caught in time.

Here he's going through the same multi-layered cake, but he's looking at it in terms of its radical simplicity of ground and concept. *Thana* and *paññatti*. And here we have two more technical terms.

What's ground? *Thana*. And *paññatti*—conceptualizing.

First of all, ground. Now, as soon as Mahakassapa says that, everybody in the audience knows he's talking about dependent arising. It always comes back to dependent arising.

Back in the eighties, I spent a fair bit of time at Wat Suan Mok, and was influenced by the teachings of Ajahn Buddhadasa. He really emphasized the centrality of dependent arising and he said: if you understand dependent arising you understand what the Buddha is talking about; if you do not understand dependent arising you do not understand what the Buddha is talking about. It's really that simple. And you can see that again and again—it all comes back to this.

We've talked about dependent arising. Its basic message is that experiences arise dependent upon other experiences. So if something happens, the arising of that something depends upon something else. And when it ceases, its cessation depends upon something else. So everything is embedded in this multi-dimensional network.

Now, for something to arise, for something to happen, it needs a base, a foundation, a ground. It has to be located somewhere. It has to be founded on something. Otherwise it could not manifest.

Let's take as an example this teaching of contact, the immediacy of experience. Contact is the coming together of sensitivity, sense object, and their corresponding awareness. We've spoken about this on a number of occasions.

Notice how this is structured. You have three elements, each one grounded on the other two. And together, when they come together and they ground each other, then—bang—something happens.

So you've got a network of events, and each event—sensitivity, awareness, sense object—is grounded on something else. Take for example awareness. We've been working with awareness all through the retreat. When I am aware, I am aware of something. It's not particularly controversial, is it?

So another way of looking at it is awareness is grounded on its object. It needs that object in order to exist. Awareness is grounded in the other direction.

For there to be awareness of an object, there has to be a corresponding sensitivity that can pick it up. Take, for example, hearing. There's awareness of sound, which has to be grounded on the sound itself. But equally on the other side, it has to be grounded on the hearing sensitivity.

Now let's say you change the hearing sensitivity. There are species, of course, that hear sounds that we do not, because their hearing sensitivity operates at a different frequency. So there are species that are hearing things that to us is silence. And maybe it's vice versa. Maybe we hear things that other species don't hear. Because for the experience to arise, it's got to be grounded.

So with awareness itself there are two sides. It's grounded on the object, but it's also grounded back on the sensitivity itself. And this sensitivity grounds the whole thing.

Now all of this is just natural process, and as we said, there's absolutely no problem with it—it's just nature. But what happens when we place too much importance on what grounds experience?

Let's look at, for example, the six sensitivities: seeing, hearing, smelling, tasting, touching, minding. Where are the first five? Well, they have specific location. Here. So seeing can only occur here. Hearing can only occur here. Touching can occur throughout the whole body, but it can only occur here. It cannot occur there. It's grounded here.

Mind is a bit trickier. Does mind actually have location? There's a sense in which it feels like it does, in that when I think, sometimes I have the sense of thinking here. But at other times, if I get lost in a fantasy, it separates from here. We've been talking about this—the role of mindfulness of body. Part of it is to keep the thinking process itself grounded on the five physical senses. So this experience is grounded. It's here.

But what if I take the ground too seriously? What if I take as real: "Well, if it's grounded here, there must be someone here who's doing all this. So here I am—this is me, this is the soul"? And if there are concepts going on, these concepts must be grounded on me. They must be about me. And if they're about past and future, they must be about my past and future. And so we become obsessed with our particular stories.

So that's ground. Then you get concept paññatti. When there is eye-sensitivity, forms, and visual awareness, we find a ground for conceptualizing contact. When there is a ground for conceptualizing contact, we find a ground for conceptualizing feeling.

Now concept here always has the implication of meaning. Concepts give meaning. They tell us what it means—what the experience actually means, what its significance is. And for there to be meaning, there has to be some degree of interpretation.

So let's say a thought. A thought pops up. I can conceptualize that as "this is a thought." Or I could conceptualize it as "this is just a thought." Now the meaning is different. And with that different meaning, there's a whole different relationship.

If I'm a meditator and I have this: "Oh, this is just a thought," I'm not putting anything extra on it. It's just a thought. It doesn't signify anything else. Or the thought arises and my concept might be "this is my thought and it's about me."

So the only difference is the meaning that I put on it, and the meaning is just a concept. So I change the concept and I change the significance of the experience, and everything that follows from that.

Concept is very important. The concept creates the world of meaning. What I think—even what I assume is going on—is all created by concept.

Now what Mahākaccāna is doing here, he's pointing out the ubiquity of concept.

It goes incredibly deep into the mind. Mahākāčana talks about contact, feeling, and perception—the really basic, fundamental movements of the mind that create an experienced world. But he's pointing out that when you look at what we actually do, we conceptualize contact, we conceptualize perception, we conceptualize feeling. We're adding something to it all the time because we're imposing an interpretation on it. It has to mean something. And that is the realm of concept.

But what this does is cut off the simple immediacy of contact, perception, and feeling. Yesterday we talked about how it's like cling wrap that's been wrapped over the experience. There's something getting in the way. It's not completely clean. There's a degree of alienation there. And this sense of alienation goes extremely deep.

How does labeling the experience fit with this when we're using the Mahasi method? If you identify with the labels or get stuck on them, you've got serious problems. The labels are meant to simply direct awareness, to aim the awareness. To do this kind of work, the awareness and attention have got to be very refined.

How do I develop a refined attention? I start by working with the obvious, but I learn to aim as precisely as possible the awareness through the act of attention. The name, the label, is all about the aim. At some point, it gets in the way, and then you drop it. If you need it again, you use it again. But if it gets in the way, you drop it.

The classic instance of getting in the way is if you're doing the standard Mahasi three-step—lifting, pushing, placing—and then at some point you realize you're going "lifting, pushing, placing, lifting, pushing, placing, lifting." What's happened is that you're using the concept to aim awareness, but instead of awareness going to the actual experience, it's gone to the concept, gone to the name. You've got a kind of bizarre mantra. The ease with which this happens demonstrates the ease with which we get lost in concept, how we mistake the concept of the event for the event itself. This is something that becomes clearer the more refined awareness becomes—you can see this process happening at deeper levels.

The actual label is part of perception, isn't it? Perception includes recognition, which is a kind of deeper, more unconscious labeling. But that's different from what we're talking about here—taking a name and consciously using it.

For example, do you think right now that you can see me? That's a concept. And yet it seems real, seems to be the actual thing. But it's a concept—hopefully a useful concept.

Mahākāčana points out that this whole process requires a ground, needs to be grounded on something. We assume that what we take to be real is solid, but we can't maintain that perception unless the ground on which it's based is also solid. But what is the ground? If we actually search for the ground, what do we find?

We looked at contact, the immediacy of experience. The ground there is a dynamic interrelationship between three phenomena: sensitivity, sense object, and awareness, each of them grounded upon the other two. In other words, it's like a house of cards with no table underneath it.

This is the very foundation. And all it is, is this little house of cards. Pull out one card, the whole thing collapses, and there's nothing underneath it. So where's the ground?

This is what Mahāpajjhāna then starts talking about. When there is no eye sensitivity, no form and no visual awareness, we do not find a ground for conceptualizing contact. When there is no ground for conceptualizing contact, we do not find a ground for conceptualizing feeling. When there is no ground for conceptualizing feeling, we do not find a ground for conceptualizing perception. When there is no ground for conceptualizing perception, we do not find a ground for conceptualizing thinking. When there is no ground for conceptualizing thinking, we do not find a ground for conceptualizing concepts of perceptions colored by proliferation.

Here he's pulling the rug out. This "no," this "not," tells us that we're in the area of anattā—not-self—and śūnyatā, emptiness. This is the realm of the not, the no. What he's specifically talking about here is the cessation of the sense fields, and therefore the cessation of everything else that is built up on top of them. No eye sensitivity, no form, no visual awareness. Cut, cut, cut.

Now if there is no eye sensitivity, no ear sensitivity, no nose sensitivity, no tongue sensitivity, no body sensitivity, and no mind sensitivity, what does that mean? Dead.

So is he saying, "Look, don't worry, I can solve all your problems. Line up here. Single bullet to the head. Guarantee no further problems"? No, he's not saying that. He's saying something quite different, but quite challenging.

To get a sense of what he's talking about, let's look at another discourse—a discussion between Mahākoṭṭhita and Sāriputta. They were friends, and there are a number of discourses where after a day's meditation they gather in the evening and have a little chat. Some of these chats became suttas. In this particular evening, what they're talking about is what happens—they're talking about the cessation of the six fields of contact. In other words, what Mahākaccāyana is talking about.

Specifically, what remains, what's left over after the six fields of contact fade away and finally cease? What's left? What is there?

Mahākoṭṭhita asks Sāriputta, "Is there something still left?" And Sāriputta replies, "Ma hevaṃ"—which could be translated as "Not that."

"Well then, is there nothing left?" "Not that."

"Is there both something and nothing left?" "Not that."

"Neither something nor nothing left?" "Not that."

What Mahākoṭṭhita is presenting are the four logical possibilities: A, not A, neither A nor not A, both A and not A. These are the four possibilities. There's nothing outside of that range of possibilities. Is there something left? Is there something not left? Is there something both left and not left behind? Is there something neither left nor not left? All possibilities are covered, and he gets the same answer each time: "Ma hevaṃ"—"Not that."

Now this answer is interesting. It's not simply "no." If you break it up, it becomes ma plus hi plus evaṃ. Evaṃ is emphatic, hi is emphatic, and ma is a prohibition. It's both a prohibitive denial and an emphatic denial. It's both "no" and "don't even go there."

Don't even go there. That does not apply when the Buddha was asked similar questions. It's a different response, coming at it from a different angle, but much more emphatic. It's just boom! That does not apply.

This is more like philosophical discussion elsewhere, but here it's not "don't do that"—it's like bang. Much more direct. It's got a certain Zen flavor to it. And Sariputta goes on to explain, which is not very Zen, because in Zen they would never explain.

He says: "To say that there is something left after the six fields of contact cease without remainder is to proliferate what should not be proliferated"—where you could say it's to complicate what should not be complicated. "To say that there is not some-

thing left, that there both is and is not something left, that there is neither something left nor nothing left after the six fields of contact cease without remainder is to proliferate what should not be proliferated, is to complicate what should not be complicated."

In other words, you're just adding another concept on top of it.

"As far as the six fields of contact extend, that is the range of proliferation. And as far as the range of proliferation extends, that is the range of the six fields of contact. From the fading away and cessation without remainder of the six fields of contact, there is the cessation of proliferation only"—the calming of proliferation.

These terms—cessation (nirodha) and calming (upasamati)—both indicate nibbana. They both indicate awakening.

What do they mean by the cessation of sense contact? I'm sure they don't mean that we should be blind and deaf. Well, let's have a little Zen story to try to explain this.

This is from Case 20 of the Book of Serenity. Lohan Kuichen asks Fayan Wenyi, "Where are you going?"

This is the context of the story. In China, in the Chan tradition, and even today in Korea in the Seon tradition, the basic rhythm of meditation monks and nuns is that each year they have a summer retreat and a winter retreat, each lasting three months. If you're a meditation monk or nun in these traditions, you spend six months of every year in intensive retreats—three months on, then a break for three months. Three-month retreat, break for three. Three-month retreat, break for three. And you do that for however many years you want to keep doing that.

At the end of each retreat, people scatter. They go on pilgrimage, quote-unquote. Now, pilgrimage could be anything. It could be "Let me out of here, I'm going to take a holiday." Or it could be "Now I've got to go to the study monastery and study sutras and Vinaya." Or it could be "Now I've got to go to the fields and put some work in." Or whatever. Or it could be "For the next retreat I want to go to another monastery where there's another teacher," and you could be doing the rounds. It could be anything.

Lohan is the teacher and Fayan is one of the students—a senior student. So at the end of the retreat, people are leaving, Fayan is leaving, and Lohan says, "Where are you going?"

It's an innocent question, which in Zen context is never innocent. Equally, the question "Where are you coming from?" is never an innocent question.

Fayan said, "I am on pilgrimage, following the wind." So he's got no specific plan. It's not that he's got a fixed idea of what he's going to do. He's following the wind.

Lohan said, "What are you on pilgrimage for?"

So what's your purpose in doing this?

Fa Yen said, "I don't know."

Lo Han said, "Not knowing is most intimate."

Fa Yan suddenly attained great awakening.

Do you get a sense of what's going on here? If there's no laying of any concept on it, that is complete intimacy. And with intimacy, awakening can come.

Of course, Fa Yen was ripe. He'd been doing a lot of meditation. And of course, Lo Han knew he was ripe. He knew Fa Yen just needed a shove.

It's very common, for example, that in the context of a retreat, people often say that when insight arises, it arises more often in walking and daily activity than in sitting—because the pressure's off. Equally, people will say that insight often arises after a retreat. Again, when the pressure's off.

So Fa Yen had been in a pressure cooker for three months. And just when he's leaving, that's when the teacher pounces. And because he's so ripe, Fa Yen gets it. Not knowing is most intimate. No concept added on top of it. Nothing getting in the way.

And this is what Sariputta is getting at. He says, to give any answer to that, to create any concept about it, you are just complicating what should not be complicated. You are proliferating what should not be proliferated. The question itself is just more proliferation, much less any answer.

Any concept or description that we produce as an answer has to be grounded on something. But Sariputta is speaking about a state in which there is no ground for anything at all.

This brings me back to the question from last night a little bit: Where does planning fit in with this? Or procedural memories like the memory of how to walk? Or like, say the Buddha wanted to go to a certain city so that he could go and spread the word there. He had to plan that in his mind.

That's right. And as he was planning it in his mind, he was quite clear it's just a plan in his mind. His self wasn't wrapped up in that. No, and he had no investment in the reality of that future event. He didn't mistake his concept of that possible future event to be real. It was just a thought, a plan coming up in the present. It was just mental activity happening now. That's it.

How does that fit with the cessation of all sense stuff?

That's actually what we're talking about. The conceptualization, the imposition of meaning that gets in the way—it gets in the way because we hold to the ground. We get ourselves mixed up in it. We think, "This is me. Ah, this is content." Bang. We've just put a concept on it. And we hold on to the concept and we believe the concept to be true. And all of our energy is going to the concept and not to the actual experience.

The experience is a sense of cleanness where you're not putting anything on it at all, where in that intimacy there is no felt sense of past, of future, of present, or even of purpose. It's just the activity itself. "I'm just doing it." Not even the "I"—that gets in the way. There's just the doing. There's just the activity.

The first time I got a sense of this was actually long before I got involved with Buddhism—back in my misspent youth, when I did acting classes. The classes were in what was called the Method, developed by the Russian Stanislavski, who I've recently discovered was actually influenced by yoga and Buddhism. Buddhism has been part of Russian culture for centuries, from Central Asia.

In these classes, we would do exercises in a theatre in the round, with students gathered around and the teachers observing. The teacher would give the class an exercise, and anybody could get up and have a go. It might be something like: look for something and then find it. So you're on this stage with everyone watching, and you simply look for something and then find it.

The highest praise you could receive was that it was "a clean action." In other words, you were not acting *as if* you were looking for something and finding it. As far as any external observer could see, you *were* looking for something and then you found it. There was nothing put on top. That putting on top—they called that acting. A layer on top of the action.

When you actually did it—when you were on stage doing this exercise—you always knew if you were clean or not clean. The difference was so obvious you didn't need to be told. But when you were clean, there was a smoothness and a beauty to it that was really quite extraordinary.

That was the first time I got a taste of this, and I was reminded of it years later when I was doing meditation and things began to come together. Just recently, when I was doing my own meditation retreat in Malaysia—I do these self-retreats in a hut—every day I clean the hut and the veranda. First I sweep, then I mop.

One day I was mopping, trying to be continuously mindful, and I was just doing the mopping. Suddenly I realized what the Zen expression meant when they said to do something "with your hands empty." There was no mop and there was no veranda and there was no one mopping the veranda. It was just so obvious. But of course, as soon as you put a concept on it, it starts to crumble.

So this is what's meant here by cessation. It's not cessation in the sense that you don't see, you don't hear, and so forth. It's cessation of any concept about seeing, hearing, smelling, tasting, and so on. You're not putting anything on it.

But here's the paradox: if you're not putting anything on it, it's not cessation—because if you say, "That's cessation," you've just added something. You've just stuck in a concept. If you say, "Oh, that's contact," bang—you've just put something on it. If you say, "It's not contact," bang—you've just put something on it. And so forth. It's the dropping of all that which is the cessation of everything.

A student asked: "What about perceptions? I was thinking, when you said you look at me, you're looking at Patrick as a concept. If I was to walk along a street and see you coming in the distance—seeing a person coming in the distance, and then I'm looking at this person, and suddenly I have recognition. That's perception. But then from that perception comes proliferation, conceptualizing—as you realize how lucky you are that you've bumped into him. But the perception... does that fall away as well?"

You know, perceptions aren't falling away. We have perceptions. I need to have a memory of you to recognize that it's Patrick. And I actually say, "Oh, it's Patrick." I can be aware of the perception. It's the same as when I'm in the dark looking at something and I can't quite make it out... "Oh, it's a cup."

What this is talking about is the cleanness of the experience of it. It's the dropping away of any barrier.

Well, you could say it's the dropping away, in this case, of perception-perception. The perception. It's like the extra bit added on. Oh, I'm perceiving. So it's taking everything away except the natural process. But the natural process includes everything that the mind-body does. So it includes walking down the street, recognizing someone, going up, having a chat, and so on.

In one of the emptiness suttas in Majjhima Nikaya, the Buddha talks about how it's in a state of emptiness that he can do things like the work involved in being a Buddha and talk to kings and to potentates and to businessmen and to followers and so on. When he does that, when he's being engaged in worldly activities, he enters into a state of emptiness in order to be able to do that most effectively. Which means that when it's happening, he's not getting in the way.

Does that make any sense?

Yeah, it makes sense. I'm just processing it in my mind, the cleanness of perceptions.

And along with that, the cleanness of action.

Yes.

Again, this comes out in the Zen stories, the way that they're structured. So you have a story in which a student goes to the teacher to find out what's going on, but doesn't understand the encounter, because it's really weird, gives up, decides he's going to leave, and he's advised, well, at least say goodbye to the teacher. So he goes in and he says goodbye to the teacher, and the teacher says, oh, you should go, well, then go and see so-and-so, and refers him to another teacher. And he goes to this other teacher, he has an encounter with the other teacher in which he realizes what's going on and he has his great awakening and he comes back to the first one.

Now in the midst of all this, you have that, when he goes to see the first teacher to say, I'm out of here, I'm going. And the teacher says, oh, well go and see someone else. Did that teacher plan that statement? Did he have this as a policy option in the file to deal with this particular student? No. It just came out. There was no planning. He didn't think about it. He says, well do this. And it turned out to be the thing which helped stimulate the awakening of that student.

Or let's say when I'm doing the interviews someone comes in and they present me with their story. And what I have to do is listen very carefully and try to say something useful. Before I say something, usually I've got no idea what I'm going to say. Zero. But while the person is speaking, I have a sense of, I have to try to sort this out so I can say something useful, then probably what I will say will not be particularly good. But if there's none of that, if I'm just listening and just seeing, and then I just say something, that's when I'm at my best. And often I surprise myself. Like, where did that come from? I don't know where that came from.

So this is... It's an action which is clean because it's not adding any conceptual overlay on the purity of the experience. This is what they're talking about when they talk about clear attention.

Is that sati? I think somebody said that that's what it is, bare attention, seeing things as they are. But that's always easy to understand and practice when there's the five senses, the five physical senses. When it comes to mind, bare attention on mental objects is one thing that I do with, what I intend to do with settling in with this mind, this natural state, where I just open my eyes and I watch my mind. And just let... concepts be concepts so I think that comes back to that bare attention with mental objects bare attention with like seeing you perceiving Patrick bare attention with that just to see it as Patrick just Patrick without adding further on to it without adding on oh here comes Patrick blah blah blah so then when you have an encounter with someone there's a spontaneity there which would otherwise not be there.

So could this be an example where in English there actually is already a translation? Because it sort of sounds like a lack of self-consciousness. And self-consciousness could be like a made-up Pali translation, only it's not. Self-consciousness in the sense of... Some of what you're talking about is when you're not suffering from self-consciousness it's a lot easier to do things. Self-consciousness can be seen as consciousness of oneself with paranoia added.

There's a quality of paranoia to it or even yes an imagined other maybe rather than necessarily paranoia yeah so what if you had could you have self consciousness without any imagined other would that be possible sometimes the imagined other is there laughing.

But could you have self-consciousness without any imagined other? Would it still be self-consciousness?

I'm thinking about the concept and the thing of being locked or freed from concept. So if I'm in a room and the door's locked and I can't get out, I'm a prisoner of that conceptual room. If the door is unlocked, it doesn't mean I can't use the room anymore. It just means I'm free to come and go.

I've just moved back to my old hometown and am meeting people who haven't seen me for ten, fifteen, and twenty years. I really see the difference between people who are locked into the concept of who I am versus those who are free from that conceptual prison. Some people respond to me because they're completely locked into their concept of who they think I am from twenty years ago. They're completely trapped in that framework, and I'm not that person anymore.

Other people recognize me—perception is there, they know me as a person they knew—but because they're not locked into the concept of who I was, they're open to experiencing who I am now. So it's: "You're the person I recognize, who are you?" There's that openness to the direct experience of what is, while still being able to use the conceptual framework of recognition.

So it's using concepts, not being used by them. That's essentially what we're talking about. Hence with the awakened ones—just because they're not locked into concepts doesn't mean they can't use them.

One of the implications of this is that you have two approaches. There's the "let's clean out the consciousness" approach—like dipping a bucket into the ocean and repeatedly throwing away our delusions and attachments, trying to get them all out. Or you can cut through the whole mass by not identifying. They're there, but by not identifying with any of them, you slice clean through. That's a whole different move.

But it requires—and this is why this practice is so central—that intimacy is something we start with by patiently cultivating over time. If you look at our story with Fa Yen, he had who knows how many years of hard work, but at some point, "Oh, got it." These moments meditators routinely report—suddenly this flash of seeing when things drop away and it's all clear. This is the insight side, but the serenity is the patient working away, being intimate.

So dropping away the proliferation—dropping it, recognizing it, dropping it, recognizing it, dropping it. This is the humdrum day-to-day work of meditation practice. But at some point the process ripens and then something falls away.

You mentioned that often the insight comes and the pressure is off, and you were wondering whether there's a link with effort. Often wrong effort comes from a concept—a concept of what it should be, what should be here, what should not be here. "This experience is not good enough, I've got to somehow push through it to get to..." Or "I should not be thinking this, so I've got to suppress it."

Underlying that is a concept of who the meditator should be, what the meditation practice should be, what the experience should be. But it's just a concept. Giving up those concepts, there's definitely a link with effort. When we're in a world of concepts, it's much harder, if not impossible, to find right effort.

Right effort in its purity is associated with the dropping away of these concepts. But it's a gradual process—you become more refined with it over time. This is the serenity aspect—working on it bit by bit, getting better and better and better at it. But then there's the insight side, where it ripens and suddenly—bang—"Ah, that's what it is."

So there are the two sides: the practice side and the realization side. The serenity and the insight. What we can do is the serenity.

So Mahākaccāna gives this teaching and the bhikkhus, if I recall correctly, are reasonably pleased.

And the next day they report all of this to the Buddha. The Buddha approves, saying, "Yes, I would have said the same thing except I just wanted to bugger off and watch some TV."

Then Ananda says to the Buddha—Bhante, Ananda was the Buddha's younger cousin, probably about twenty years younger than the Buddha, and he served as the Buddha's attendant for the last twenty years of his life—Ananda says, "Bhante, just as one exhausted by hunger and weakness coming upon a honey ball, a madhu pindika, would find a sweet, delectable flavor when he tasted it, so too, any practitioner with a good heart who investigates the meaning of this dharma discourse with wisdom would find joy and inspiration in his heart. Bhante, what is the name of this dharma discourse?"

"As to that, Ananda, you may remember this dharma discourse as the Honeyball Discourse, or the Discourse of the Sweet Essence, Madhu Pindika Sutta."

This again is interesting. These discourses were often named at the time. "Wow, that was interesting. What would we call this one?" Marketing. But in particular, the Buddha says, "You may remember this dharma discourse as..."—in other words, you're going to recite this. So they craft a form for recitation and now you can give it a name. What shall we call it? They're creating teaching as they go.

Now the sweet essence—what is this sweet essence? Well, of course it's the essence of absolutely no essence whatsoever. It's the unconditioned. It's the taste of nibbana itself. Nothing at all to write home about.

That's enough for tonight. Thank you.

CHAPTER 29

On Dukkha & Dukkha Ñāṇa

Patrick Kearney · 1h25

In this comprehensive dharma talk, Patrick Kearney explores the crucial distinction between ordinary dukkha (suffering) and dukkha-ñāṇa (understanding of dukkha) as it unfolds in insight meditation practice. Drawing from the Dhammacakkappavattana Sutta (SN 56.11) and the four noble truths, he examines how dukkha functions as both a fundamental teaching and one of the three universal characteristics (tilakkhana).

Kearney traces the historical development of the vipassana-ñāṇa system from the early Paṭisambhidāmagga through to Buddhaghosa's Visuddhimagga, explaining how the linear progression through sixteen stages of insight emerged in the Theravada tradition. He provides detailed analysis of the dukkha-ñāṇas: bhaṅga (dissolution), bhaya (fear), ādīnava (danger), nibbidā (disenchantment), muñcitukamyatā (desire for deliverance), and paṭisaṅkhā (review).

The talk emphasizes the critical importance of understanding anattā (not-self) when navigating these potentially dangerous territories of insight, distinguishing between psychological approaches that deal with 'people and their problems' versus dharma practice that reveals the emptiness of both self and suffering. Kearney warns of the risks inherent in commodified mindfulness approaches that lack proper grounding in the three characteristics, while celebrating the 'boundless joy' that emerges when dukkha is truly understood as universal rather than personal.

Tonight, by special request, we explore dukkha. We'll trace a journey from dukkha to dukkhañāṇa—the understanding of dukkha as understood in insight meditation—because it's centrally important, most difficult, and can be misunderstood. It's very easy to get stuck there, so let's survey the whole territory.

We've encountered dukkha before in the Dhammacakkappavattana Sutta, the first discourse. The Buddha begins with the middle way and goes straight into the four truths, which revolve around dukkha: dukkha itself, its arising, its cessation, and the path leading to its cessation. Notice that what's central is the dynamism of dukkha—it arises and ceases.

This occurs within the background of dependent arising: if something arises, it arises because of something else. If it ceases, it ceases because of something else. The practice is all about relationship. In the Four Noble Truths, the Buddha points out that if you're concerned with dukkha, you must examine the relationship to drivenness—what he calls craving, literally thirst.

Dukkha is a compound word based on the root *kha*, meaning empty space, while the prefix *du* conveys the idea of bad, painful, unpleasant, or undesirable. We could understand dukkha as meaning the painful emptiness we find at the center of our being—what David Loy calls the sense of lack, something missing. The tradition also sees it as the empty space that is the hub of a wheel where the axle doesn't fit properly, so the vehicle moves slowly with great grinding, if it moves at all, or becomes completely bogged down.

Have you ever felt that your practice or your life has been completely bogged down and you can't get it to move? This is dukkha. It's always characterized by drivenness—this is craving—and you could say it's the gap between what is happening and what we want to be happening. As long as there's that gap, there's dukkha. The cessation of dukkha represents bodhi, awakening, or nibbāna—the going out and cooling of the fire.

Beyond dukkha as a key technical term—for which there's no English equivalent, making any translation necessarily inadequate—dukkha is treated by the later tradition as a universal characteristic, a sāmañña lakkhaṇa. This is one of the three characteristics: anicca, dukkha, anattā—impermanence or change, dukkha itself, and not-self.

These three characteristics are what insight meditation focuses on. Strictly speaking, insight meditation begins when the object of awareness is one or more of the three characteristics. Until then, we're doing preliminary serenity practice to reach that point.

We discussed this in the Satipaṭṭhāna Sutta. Remember when the Buddha talks about the nature of arising and ceasing? The practitioner lives observing body as body, but then he switches: the practitioner lives observing the nature of arising and the nature of ceasing. There's a shift where what's actually being observed is change itself—impermanence itself—rather than something which is changing.

Impermanence is always mentioned first, then comes dukkha, then not-self. Impermanence is extremely important. The Buddha told his son Rāhula: "Develop meditation on the perception of impermanence, for when you develop meditation on the percep-

tion of impermanence, the conceit 'I am' will be abandoned." Abandoning the conceit "I am" is code for full awakening. We've discussed asmimāna, the conceit "I am," in terms of not-self.

The word translated as impermanence is *anicca*. *A* is the negative prefix meaning "not," and *nicca* means stable, constant, permanent—*nitya* in Sanskrit, *nicca* in Pali. In ordinary, everyday usage, *nicca* refers to what can be relied upon. In Pali you get the expression *niccadāna*—a perpetual gift. If some wealthy person makes suitable provision in their will and a meditation center receives a perpetual gift of thousands of dollars per annum, suddenly the committee is very happy and can make long-term plans confidently.

because they have a reliable source of income. So this is nicca. Nicca bhakta is a reliable food supply. And so on.

So to be anicca—impermanent—means to be unstable, inconstant, discontinuous, and therefore unreliable, not to be trusted. And if we rely on something which is unreliable, then sooner or later we are disappointed. It will happen. It's just built into the relationship.

So that which is anicca, impermanent, is also dukkha. Does that make sense? It's the unreliability inherent in change that means that which is anicca, impermanent, is also dukkha. But if you say it in English—that which is impermanent is painful—it's like scratching your head. Why? It doesn't make any particular sense, or at least it didn't to me when I first read it.

In the Buddha's time, the idea of the nicca, or the nitya in Sanskrit—the permanent—was very important because this is the ground of things. This is what gives everything its stability. So for example, in the Upanishads, the nitya, the permanent, the constant, is the Atman. This is the self—in English usually written with a big S—the Self that underlies everything.

In other traditions the nitya might be God. So the creation swells about, full of suffering, we are a pilgrimage people, but underneath all this is God, and that is permanent, and it holds everything together and it gives all this floating impermanence meaning and purpose because this is the ground.

But the Buddha is saying there is no such ground. It just doesn't exist. There's nothing that underlies and stabilizes what we experience as the world. And perceiving this fact—at least for him it's a fact—perceiving this creates anxiety.

So if we're tracking impermanence and change and we haven't yet felt anxious because of it, we haven't really perceived impermanence. If we really see it, then we're horrified. It's extremely anxiety-inducing.

It reminds me of the classic story—I looked it up in Wikipedia. There's some doubt whether it actually comes from Hinduism, but let's call it Hindu. The story goes about a learned Brahmin who had a bright young son, and the son was asking him about cosmology. Remember we said in ancient India that cosmology was you had the four great continents, Mount Meru in the center, surrounded by the great ocean, all held together by the great wind.

And the boy was very inquiring. He was told about this model. He was very impressed. And he said, "But what supports the great wind?" And his father says, "Oh, that's a very good question, my lad. I'm glad you're alert and paying attention. There are four enormous tigers—north, south, east and west. And the whole edifice sits on them."

So the boy thinks about it and he says, "What's underneath the tigers? What supports the tigers?" And the father is very impressed. He says, "That's an excellent question. Under each tiger there's a huge elephant. So everything's completely stable."

And the boy thinks about this and he says, "But what's underneath the elephants?" And the father says, "This is a superb question. You've got a very sharp and inquiring mind. Under each elephant there's a giant turtle."

And the boy thinks about this and he says, "But what's underneath the turtle?" And the father is really pleased because he says, "Not many people inquire this far, but the esoteric teaching is under each of these giant turtles is an even bigger turtle."

And the boy is really impressed. And he says, "So what's underneath that turtle?"

And at this point, his father gets a bit anxious and he says, "My boy, it's turtles all the way down."

This is pure Nietzsche. It's turtles all the way down. Fundamentally, there's nothing there. And to actually see this, to intuit it in some way, is to provoke anxiety.

Now, regarding the three characteristics, there's one famous text in which the Buddha presents what he thinks these are about. He says: "Whether Tathagatas appear or do not appear, this reality is constant—the stability of Dharma, the natural order. All

constructions are impermanent. This is what a Tathagata awakens to, this is what he realizes. After awakening to and realizing it, he explains, teaches, declares, lays it out, reveals, analyzes and clarifies it, saying: 'Look!'"

Whether Tathagatas appear or do not appear—a Tathagata is an awakened one, so the Buddha is a Tathagata—whether Buddhas appear or do not appear, this reality is constant, the stability of Dharma, the natural order. In other words, this is simply the way things are. Whether or not I'm here to tell you about it, it's just the way things are.

And he goes on to say: all constructions are dukkha, all phenomena are not-self. After awakening to and realizing—this is what a Tathagata awakens to, this is what he realizes. What is the content of a Buddha's awakening? It's this fact: all constructions are impermanent, all constructions are dukkha, and all phenomena are not-self. And this is what any Buddha teaches when he teaches.

What he's saying is that these characteristics—impermanence, dukkha, not-self—they are simply part of nature. They're what we might call the laws of nature. They're simply what is going on. We might know about it, we might not know about it, we might care about it, we might not care about it, but the fact is this is what's going on. Full stop. End of story.

So let's just briefly look at this teaching. You notice how the Buddha changes the language: all constructions are impermanent and dukkha, but all phenomena are not-self. Why does he change?

We talked about constructions before. Sankhara comes from the verb karoti—to build, to make, to produce, to act, to perform, to do. From karoti we also get karma. It's the same root. And karma, of course, is action. So karoti is the verb, and the prefix sam- means "with" or "together." So the verb sankharoti means to put together, to construct. A construction, a sankhara, is anything that is put together, constructed, made up out of parts.

This building is a sankhara, this body is a sankhara, this retreat is a sankhara. It's put together, constructed, made up out of parts. But further, sankhara means anything that in turn puts together, constructs, creates. So it's also active.

This hall is constructed, but it in turn constructs. It provides a suitable environment for meditation practice. There are people out there busily paying the bills for the heating and so on. There are people who clean it up so it doesn't get too dusty. And as a result, we can sit here for a month and develop a meditation practice, and this practice is constructed in part by this hall.

So anything that constructs, anything that is constructed, this is sankhata. And what is not constructed is the asankhata, otherwise known as the not-born, not-become, not-made. And this is the realm that we enter into with bodhi, awakening, and nibbana, the cooling of the fire.

And of course, we've touched on this before: what is it that we find in this realm of the not-constructed, the unconstructed? Sometimes people call it the unconditioned. I think it's more accurate to call it the unconstructed.

If we ask what we find in this realm, we discover nothing that can be adequately spoken about. And why not? Because speaking itself is a construction. Speaking is just another construction. And thinking about it—thinking too is just another construction. So there's nothing that can actually be said about it, because whatever we say is a construction and therefore is not the unconstructed. Does that make sense?

So all constructions are impermanent, all constructions are dukkha, and all phenomena are not-self. The term here is in Pali, dhamma—so all dhammas are not-self, or in Sanskrit and in English, dharmas. We've talked about dharmas already.

Again this comes back to dependent arising. The Buddha sees the world in terms of process rather than solid, independently existing things. So for the Buddha, reality is all about process and relationship, not things. And when we examine process, we don't find things that are hard, that are solid, that last unchanged over time. What we find are events. Something arises—bang. And again, it's the language the Buddha uses. He says something arises and then it ceases. The language is very dynamic. He's not talking about a solid something that's there and that lasts a certain period of time. He's talking about an event which arises and ceases.

So dharmas are these events, but in particular they are experienced events. This comes back to what we were talking about before—the Buddha as radical empiricist. The only thing he's interested in is the nature of human experience. In a sense, this makes him very secular because he doesn't make ontological commitments. He doesn't create fanciful belief structures about a transcendent God or whatever, or transcendent Atman, self, or Brahman, or whatever. He just doesn't go there. He's interested only in the nature of human experience. Anything beyond that, he just doesn't want to talk about it—complete waste of his time and everybody else's time.

He believes in devas, he believes in heavens and hells, but he believes in them on the basis of his own experience. He's experienced them. Now, it's difficult to argue with that. One might say, "Well, I haven't experienced it." Fine. But in saying what I've experienced, I'm not saying anything at all about what you have experienced. Or one might

start getting aggro about it, and one might say to him, "Buddha, mate, you know, with the greatest respect, if you have experienced heavens and hells, then you are a lunatic and you really need some help. I mean, you're a nice guy, you've said some really interesting things, but you are in serious need of professional assistance." Fine, one might have that opinion, but the thing is, again, it doesn't tell you anything about his experience. It tells you about your own experience and your own opinions, and the kind of cultural conditioning that results in having these opinions.

So the Buddha is only interested in the nature of experience. And what we find when we look closely are events that come and go. These are experienced events, and these are the dharmas, the phenomena.

So all constructions are impermanent, all constructions are dukkha, and all phenomena are not-self. Now phenomena include all of the constructions—all of the above—but it also includes the not-constructed. Because even though there's nothing we can say about the not-constructed, we cannot speak about it, we can experience it. And therefore it's a dharma. Does that make sense?

So these three—anicca, dukkha, anatta—these are universal. They cover the whole range of human experience. So these are the universal characteristics. And you notice that for the Buddha, this is not a doctrine that has been revealed from above. It's not a question of "the scripture says so." It's simply that if you look deeply enough at the nature of human experience, this is what happens. Whether there are people who wake up to it or not, this is what happens. So this is purely naturalistic teaching.

Anyway, this brings us to dukkha-nyana. Nyana essentially means understanding.

It's a word based on the root ñā, to know, to understand. With the addition of the action suffix ṇa, we get ñāṇa—the root plus ṇa. In Sanskrit and Pali, this creates what's called action nouns. So a ñāṇa is a knowing or an understanding.

This term appears often in the Buddha's teaching. For example, he frequently uses the compound ñāṇa-dassana—understanding and seeing, or knowing and seeing. In English you often see it the other way around: seeing and understanding, or seeing and knowing. I'm sure you've come across this compound before. It's very common. "Knowing and seeing in this way, would you go back to the past? Would you run forward to the future?" We talked about that before in a previous talk. And the same root gives us paññā—wisdom.

So ñāṇa is an understanding. But the Buddha's teaching is kind of all over the place in terms of the way that the suttas are laid out. Now, this is an oral tradition, but they're classified and grouped together in collections called nikāyas, and there are five of these

nikāyas. They're collected in a way which has caused great anguish and frustration to modern scholars because it seems to be just completely all over the place. If you line up the nikāyas on a bookshelf and start reading from page one and go through, you might be tempted to wonder what the hell is going on because it's just all over the place. This is typical of an oral tradition because these were never written.

But the way I like to look at it is if you imagine the Dhamma—both the way things are and the teaching of the way things are—as like an enormous relational database. Does anybody not know what a relational database is?

Many years ago when I was working temporary jobs in the public service, I got offered a job in the then Public Service Commission. This is in Canberra. I had done these really basic computer courses, including database. I was taken into this office by this senior executive, and she's interviewing me and looking at my documents. She seems to be pleased. She looks up at me and says, "We need someone to work on a relational database. Do you know what a relational database is?"

Now I had never heard of one. So my mind went into overdrive and I said, "Yes, a relational database is a database that relates one thing to another." And she smiled and accepted this answer. So I knew that she didn't know what a relational database was either.

But it all seemed to be going well, except that then we crossed to the other side of the office—the whole floor—and went to the big boss's office. It was a bit embarrassing because he was younger than I was. He studies my documents and looks at me and says, "Do you know what a relational database is?" And I looked at him and thought, "I'm not going to bluff him." And I said, "No." But he hired me anyway. It was a very good job—a great job. I quite enjoyed it.

A database is like a table. So you have a list of things. You might have several columns in the list. So you know what that is—a table with columns. Let's say you might have three columns: first name, middle name, last name. Then you get another table with several columns, and one of those columns is the same as one of the columns in the first table, which means you can relate that table to this table. And then you have another table with several columns, and one of the columns in the second table is the same as one of the columns in the third table, so you can relate this one to this one, which means you can relate this one to this one to this one. Is this beginning to make sense?

So you can have multiple tables, and each one of them is connected in some way with at least one other table. And the whole thing is the database. Imagine the Dhamma to be this huge relational database.

Now if you work with a database—which is what I was doing at the Public Service Commission—you put all the data in and then you ask a question of the database. You go do-do-do-do-do and then hit the button, and it churns out a report. And the report gives you

particular information about certain relationships among all this data. You've asked it a question, and you've got this report.

Now, having proudly produced this report on a sheet of paper, are you holding in your hand the database? No. You're holding one report from the database, particularly if it's a complex database. Let's say you work away at this job for a year or two, and you end up with this pile of reports that you've generated. If you pick up the whole pile, is this pile of reports the database? No.

If you look at the suttas, the Buddha or someone turns up, and some event takes place—an event which comes and goes according to conditions. Some particular person asks a particular question in a particular circumstance. Remember Dandapani, stick in hand, meets the Buddha. A particular person, arrogant, interested in Dharma, has potential. That event takes place. The Buddha wraps him with an answer. That answer, and in fact the whole sutta, is a report from the database.

Does that make sense? Is that sutta the Dharma? No. It's one report. The whole five collections of suttas, pile them on top of each other. Is this the Dharma? No. It's simply a whole series of reports generated from the Dharma.

If we're looking for the Dharma, where would we find it in the Buddha's time? We're talking about a computer database—you look for it in the server. Where do you find it in the Buddha's time? The entire community who have memorized all this and who have practiced it and realized it. It's like in Australian indigenous culture, the law. There's no one person who knows the law. It's the community who knows it. It can't be confined to one person. It doesn't matter if you can list all the songs. That's not the law. It's some of the law.

So the Dharma exists in the minds of the community, the Sangha, based on what they know intellectually and what they have realized intuitively. So this is the Dharma, and from this the different reports come up. The Buddha's teaching appears from our perspective—from the perspective of a literate society—to be completely disorganized, but it is organized, just in a very different way.

Now the early tradition decided they needed to organize jñāna understanding. It's quite clear that it's based on this essential framework: anicca, dukkha, anattā. That's the framework. It's quite clear that the job of the practitioner is to go from here at the beginning all the way to there, to awakening, and that this journey takes you through these three characteristics.

So, after the Buddha, presumably after the Buddha, comes the job of developing some kind of systematic way where you can organize all the teachings—the relevant ones for the purposes of the path—in a systematic, linear way that takes you from there to there. And the first attempt—what they did—was they developed a system of vipassanā jñānas. These are sometimes translated as insight knowledges or understandings of insight, which would be another way of translating it.

Now this is the heritage that frames what we are doing here. The first attempt to create a system of jñānas, of how this whole process of seeing and understanding actually unfolds, begins with a book called the Paṭisambhidāmagga, The Path of Discrimination. This is a very early text. It appears in Khuddaka Nikāya. Remember I said there are collections of the suttas? There are five of these collections, and the last one is Khuddaka. Khuddaka means miscellaneous. This is the glad bag. This is where everything's chucked in that didn't fit in the first four. And it's very miscellaneous. It includes stuff which, according to modern scholars, some stuff is very early, and there's some stuff which is very late.

And in here you get this book, The Path of Discrimination, and it's late. It's in the Sutta Pitaka, the basket of suttas, but in terms of its genre, it's an Abhidharma text. And Abhidharma came later. Abhidharma is the systematic philosophy and psychology, and it comes later—people trying to systematize all these reports from the database.

It probably dates from the third to second centuries BCE. It's so early, it's still oral. So it wasn't written down; it was chanted. But even the tradition says this does not come from the Buddha. It was attributed to Sariputta. Of course, Sariputta is foremost in wisdom. So even the tradition said, no, this isn't Buddha. This is after Buddha.

And this is a text found only in the Theravada. No other tradition of Buddhism has it. So this is a point where this particular stream is heading in its own direction and starting to form what we call the Theravada.

So Paṭisambhidāmagga, Path of Discrimination, is the first major path manual, the first attempt to systematize the teachings of the Buddha on the subject of liberation and bring them together into one orderly system. And it produces a system of eight vipassana ñāṇas, eight stages of insight understanding.

Those of you who are familiar with the ñāṇas—I'll just go through them quickly. These are comprehension, sammasana ñāṇa; arising and passing away, udayabbaya ñāṇa; dissolution, bhaṅga; fearfulness, bhaya, or bhayatupaṭṭhāna; misery, ādīnava; disgust, nibbidā; desire for deliverance, muñcitukamyatā; re-observation, paṭisaṅkhā; equanimity regarding constructions, saṅkhārupekkhā; adaptation, anuloma; change of lineage, gotra; path, magga; fruition, phala.

Centuries later, in Sri Lanka, a scholarly monk called Buddhaghosa wrote a bigger tome called Visuddhimagga, Path of Purification. He based it on the Path of Discrimination, which has eight vipassana ñāṇas, but he subdivided some and he ended up with sixteen. And it's this system of sixteen that Mahāsi Sayādaw inherited, and his system of meditation is based on these sixteen ñāṇas.

Any questions about that? Is that clear? The historical bit?

But you see, the basic point is this is an attempt to impose order on the process of liberation. And the first thing that strikes us about this system is its linear nature. You've got sixteen ñāṇas. Count them: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16. And the practitioner starts at ñāṇa one, and then when they graduate they get a little tick, they get a gold star, they move to ñāṇa two, and when they've done that, another little gold star, ñāṇa three, four—tick, tick—five... sixteen. Bing! Jackpot! Then start again.

Why do some people go round systematically and some don't? This is exactly the question that we're going to look at, because it's a very interesting problem. Some people go round and round and round forever and ever. Oh, you don't go forever and ever—you go round once. You're not going to go round forever and ever. Seven lifetimes max. John Howell said it was more like snakes than ladders.

I used to refer to it as Buddha's greasy pole. You're either climbing up or you're sliding down. You can't stand still.

Patrick: Is there any mention of the... I know when I studied with Tom Wallace we talked about the stages of...

No, they're different. Let's get to this because first of all—we'll definitely get back to this, and remind me if I slide away from it.

First of all, this emphasis on a linear development over time is typical of the Theravada. Theravada is very much concerned with process over time. Other traditions, not so much. So in the Mahayana, for example, you get this debate that's been going on for centuries: sudden awakening versus gradual awakening. You see in the

Tibetan system, where by and large gradual awakening won, but there's still sudden awakening streams. In Zen, by and large sudden awakening won, but there are still gradual aspects to it.

So there are Buddhists who have never been convinced by this business of 1, 2, 3, 4, 5, 6, 7, 8, whatever it is. And they say, no, you either cut through or you don't cut through. And when you cut through, you cut through now. It's got nothing to do with any kind of linear movement over time. And you find teachings in the Buddha's teachings which would support both sides.

In terms of the order, how can you get a linear system? It's based on the order of the three universal characteristics. When they are mentioned by the Buddha, they are always mentioned in the same sequence: anicca first, dukkha second, anatta third. Always in that order. Why is this order important?

First of all, they're listed in order of subtlety. Anicca is the easiest characteristic to notice. Have you noticed over the past month that your experience has changed? Of course. It's easy. It's obvious. Anicca is the most accessible to observe. To go deep into it is another matter entirely. When we go deep into impermanence, as I said, it provokes anxiety.

Dukkha is more subtle and harder to see. That is to say, the universal characteristic of dukkha is harder to perceive than its obvious manifestations. You can easily see dukkha in its gross forms. Could I have a volunteer? *Bash!* Dukkha. Or, in a meditation context, you could generate it artificially—sit there for two hours, do not move. Then after two hours, ask: what did you experience? "It hurt!" Ah, very good. Dukkha.

So sure, dukkha is easy to experience in its obvious forms. But the universal characteristic of dukkha is very subtle. To actually find it, you've got to go quite deep.

Anatta is the most subtle characteristic and the most difficult to see, partly because it's so counter-intuitive. "Of course I exist, so what are you talking about—not self or no self or non-self? Philosophical claptrap!" So it's counter-intuitive, but it's also the most subtle because it's not a something—it's the absence of something. The absence of what we assume is here: the self. It's not a something in itself; it's the absence of something.

The factor that brings some order into this system is, I think, samadhi, or more broadly, the serenity aspect of the practice.

Nal, your question was about the linear path of jhana and the linear path of jnana, and what's the connection between them? When the Buddha talks about the meditation process, in some texts he'll track what happens in the citta as we develop the practice. He tracks out a linear path of development: first this happens, then this, then this, then this. This linear path of development comprises the four jhanas, the four absorptions.

For example, first you're sending your awareness again and again to the meditation object. This is initial application, vitakka. Then once you develop some momentum, it starts going bang, bang, bang, bang—sustained application, vicara. Later on, these two drop away and it feels like you're not doing it; the awareness is sustained with the object effortlessly. There's some excitement initially, and then later on that excitement drops away, and so on and so forth.

So he has this linear development of the changes that take place in the citta as we go deeper and deeper into samadhi. You always have the citta that's doing the practice, and then what it is that this citta knows and sees—jnana-dasana. What that citta will know and see will depend largely on how much samadhi there is.

For example, how much do you see and recognize of the nature of your own experience when the mind is roiling with the five hindrances, versus when the mind has no hindrances? Do you get a different view? Yes. It's very different.

So what brings order into this is the degree of concentration. The Buddha will lay out a system: this is what happens in the citta as the practice develops—this is serenity. This is what the citta will know and see as the practice develops—this is vipassana, this is insight. This first one has to do with the citta, the heart.

This other approach encompasses the whole world, including the heart. Does that make sense?

Regarding the status of the jhanas—I think there are nine stages, though I can't remember precisely which ones—but they are perhaps more well-known than the vipassana jhanas, aren't they? Yes, I think so overall. It's easier to find in the texts. There's not too much reference to the vipassana jhanas, but there's abundant reference to the samatha jhanas.

Certainly this system of vipassana jhanas seems to be peculiar to the Theravada tradition. Perhaps they don't even have it in Tibetan Buddhism—I'm not sure. But everybody recognizes the samatha jhanas. This particular system of vipassana jhanas appears to be a distinctly Theravadan way of understanding how the whole process unfolds.

So it's the samadhi side that is citta-specific—the concentration practices that work directly with the heart. And this brings some order into the practice.

As the mind, as the citta becomes stronger and more refined, there's meant to be a progression: first, "Ah yes, definitely anicca!"—going deep with impermanence. Then, "Ah, there's some dukkha underneath the anicca." And finally, "Ah, underneath that there's anatta." So you get this linear progression depending on how deeply you go with the samadhi.

I wonder about that framework, though, because it's not always the case. It's definitely not always the case. Some people have a different temperament and pick up dukkha more readily than anicca. Others have a temperament that's naturally attuned to anatta, even though it's considered the most subtle characteristic.

So there's some degree of order, but it never captures the reality completely. It's always untidy.

For a start, if you truly perceive any of these three characteristics—anicca, dukkha, anatta—you have all three. They come as a package. You can't have one without the other two. They're always present together.

All three are already there, plus individual students have vastly different sensitivities. Some people are naturally sensitive to one aspect but not to the others. We've discussed how some people are very sensitive to dukkha, while others are quite attuned to change, and still others are naturally sensitive to anatta. People have completely different ranges and degrees of sensitivity to these different patterns.

As a result, any given student's experience may not follow a tidy progression through the vipassana jhanas. If you ever teach meditation, you'll find students suddenly appearing in jhanas they have absolutely no business being in according to theory. You might want to tell them, "Just stop it, get out, go back to the beginning"—but it doesn't work that way.

Any given student could stumble into one of these jhanas when, according to any kind of linear system, they shouldn't be there. But they are there.

So this system is an attempt to impose order, but it's not entirely successful. For some people, they progress bang, bang, bang, bang—just like a textbook. But for others, it's all over the shop, and you get a whole range of responses.

This is one reason why in the Mahasi method, if you go to Burma and work with a sayadaw, they will usually insist—absolutely insist—that when you sit, you follow the rising and falling of the abdomen, and when you walk, you follow the lifting, pushing, dropping of the foot. They insist on these two particular meditation objects.

If you say, "Look, I really don't like this," they'll reply, "Your likes and dislikes are irrelevant—just note them." If you say, "It's not really working for me," they'll respond, "Make more effort, be more persistent, just do it."

The reason for this rigidity is that they have learned to read the experiences that arise dependent upon those particular meditation objects. With those specific objects, they can place you in the jhanas and track your progress. But if you have another meditation object—if you walk into an interview and say, "My mind itself is my meditation object"—then all bets are off in terms of trying to pinpoint what's actually happening.

So it's partly a control mechanism, but it's also a blueprint, isn't it? Though you need people who can actually read the blueprint—otherwise, why bother?

And you've got to have people doing that particular thing in order for the blueprint to be available. If you want to work with this person, they can't read you unless you do this. So you do this.

This shapes how you actually report your experience. It becomes standardized curricula, really. The great masters themselves—if you went to see Mahasi himself, he probably would be able to cope with a range of meditation objects because he's great enough to have that sort of flexibility. But his students aren't necessarily so flexible.

In Malaysia, there's been a lot of Mahasi teaching, and when I started teaching there, I had the feeling that the standard of Mahasi teaching most students had been exposed to was not very high. I actually spoke to Bhante Aggacita, who's the abbot and an old student of Sayadaw U Pandita. He confirmed this, saying that a number of people feel the standard of teaching is declining over time. The lineage is already in decline for that reason.

So you have this system of ñanas. There are the early ñanas—three of them. Just briefly, these are: discerning mind and body (nama-rupa-pariccheda-ñana), understanding conditionality, and finally, comprehension or mastery. These three ñanas basically constitute a general introduction to the three characteristics. They're like the beginner's introduction to anicca, dukkha, anatta.

They culminate in a deeper understanding, a perception of impermanence. So you get this spiral thing—a kind of introductory level of the three characteristics, and then you get a deeper level of impermanence. We go back to one characteristic.

The fourth ñana, udayabbaya-ñana, arising and ceasing, is all about impermanence. That's where the understanding of impermanence becomes predominant and the mind is very settled and stable. You need a certain amount of samadhi to be able to get there.

So the first three ñanas basically give a quick tour of the three characteristics. Subsequent ñanas deepen and extend that insight, opening it up wider, applying it to more realms of experience and going deeper with it. It's like a spreading out to every situation and a deepening down all the way to the unconstructed.

You have the first three as the introduction, and then from number four onwards, spreading out and going down. The fourth one is udayabbaya, understanding of arising and passing away, where impermanence is predominant. After that comes dukkha. This is what we're focusing on tonight.

Before we get into that, first of all, an essential aspect of ñana is its universality. Ñana is always universal. Insight is always generalized. What's the difference between dukkha and dukkha-ñana? It's the difference between the particular and the universal.

Ordinary, everyday dukkha is particular. This situation that I'm in right now—this is dukkha. I don't like this. But perhaps not that situation over there. So an escape from dukkha seems possible within the realm of the impermanent. This retreat is getting incredibly tedious, but an escape from this dukkha is possible because it's over soon. I can hang out, it'll be over, then no more dukkha. I'll go home and lead a civilized life.

Within this understanding we feel that there could be an alternative which could work. This is what we find when we're doing the practice. Has this ever happened to you, that you find yourselves living alternate lives? You find yourself, for example, reimagining the past. "If only I had done that instead of this, my life would have turned out much better." Have you ever done that? Has it ever seemed convincing at the time?

So here there's a recognition of dukkha, but not its universality. We imagine that just a slight change in circumstances could make everything completely different—then we would be okay.

You can also imagine an alternative future: "When I get out of here, things will be different. It will be much better when I get out of here." Or we can imagine an alternative present: "Right now I'll take a break and then things will be better."

All these fantasies seem real. All of them have power over us because our understanding of dukkha is still particular, not universal. We believe that if we could just change these circumstances, there would be no more dukkha. In that situation we have dukkha, but we do not have dukkha ñāṇa.

So let's get into the dukkha ñāṇas. The first one is bhaṅga, dissolution. This is also the maturity of the perception of impermanence. If something is impermanent, that means it has a beginning, it has an end, and it has something in between. The Buddha says there's an arising, there's ceasing, and in the middle there is change while enduring. So something endures, but it changes.

You find different views of impermanence depending on which angle you look at. Sayadaw Vivekananda gave the example: imagine you live in an apartment building overlooking a freeway or raised highway, and the traffic moves from your left to your right. If you look straight out the window, you have cars come and go—come, they're there, they go. They arise, they're there, they cease. Arise, they cease. Arise, they cease.

If you turn to the left, you have cars come, come, come, come—arise, arise, arise, arise. Turn to the right, you have cars go, go, go, go—disappear, cease, cease, cease, cease. So you get different views of impermanence depending on which angle the mind looks at it.

The maturity of impermanence is when the mind sees the cessation aspect. Every time it looks, it sees things disappear. This is dissolution, bhaṅga. It's still part of impermanence, but it's the border into dukkha. Because when we perceive the dissolution, this is where we perceive the groundlessness, the bottomlessness of experience. Everything's disappearing. There's no ground. If we ask what lies beneath, nothing at all. Just everything disappearing.

What determines the boundaries between the events? Each event could be broken up into smaller events. It depends on how strong your mindfulness is and how strong your samādhi is and what angle the mind is looking at. These are not absolutes. They're always appearances. They vary depending on circumstances.

In a weak aspect, sometimes this can take the form of a meditator apparently losing concentration and being unable to focus on anything at all. Things were going really well. Everything was clear. The mind was completely focused. Now you try to focus on an object and you can't find it. Sometimes it's like trying to hold onto something that slips out of your hand. As soon as you grab it, it slips away. You can't focus. The whole practice seems to have collapsed.

In its strong form it can be like falling into a black hole, this abyss, bottomless abyss. What the mind is intuiting at this point is the bottomlessness, the turtles all the way down. And this is horrifying. The groundless nature of experience is being exposed.

And so the next ñāṇa is bhaya ñāṇa, fear. Bhaya is fear. The understanding of fear or terror in a weak form, this might be just a sense of existential unease. I feel uneasy, I don't know why. I just feel very uneasy. Nothing's going right. I feel helpless. In a strong form, it could manifest as panic. But it always has this quality of a loss of control. I'm not in charge.

"Patrick, what kind of time frames are we talking about with these things?"

Anything from a nanosecond to a year, to ten years, to a lifetime. Time is completely irrelevant here. People can slip through these very quickly or they can come, rest into one ñāṇa and just be there for months, years at a time. Apparently stuck. Just, not necessarily stuck, just appreciated. Yes, when experiencing it.

In the Visuddhimagga, Buddhaghosa doesn't call it bhaya ñāṇa, he calls it bhayatupatthāna ñāṇa, which is understanding of appearance as fear. So not understanding fear, but appearance as fear. And he asks the question: Does the knowledge of appearance as fear itself fear, or does it not fear? In other words, what's the relationship between the appearance of fear and fear?

He gives a couple of similes. There's just one I want to mention. Imagine a person who sees three great charcoal pits burning. Now, the three indicate the three times: past, future, and present. Anybody who steps into any of those pits would suffer an excruciating death. So they generate fear. Now the person looking at the charcoal pits burning away does not personally feel afraid of them because she's not about to walk into them. But she understands that anyone who does fall into them would suffer enormous pain.

So this is Buddhaghosa's attempt to explain the difference between fear and appearance as fear. And this simile suggests detachment. So the universe is fearful and there's no hope in it at all. But if the mindfulness is strong and the concentration is strong, this prevents the practitioner from being emotionally entangled in it. So in other words, fear—real fear—suggests taking danger personally. I am in danger. But the ñāṇa, when it's mature, indicates there is danger, but there's no one who is in danger.

It could be roughly compared to watching a scary movie. So fear arises, but even as the fear is present, there's the understanding that the situation isn't real, and so the fear itself is not grounded. So this suggests, as Buddha goes through saying, there's a detach-

ment here involved. If we're in a world of appearances only, there's no need for actual fear. So this is a way of distinguishing between fear and fear as ñāṇa, as understanding, which always implies some degree of not-self.

"What if you had experiences like this one about fear, but you didn't have a clue what it was about, so it wouldn't actually be understanding?"

Then you'd be in trouble. And people can be in trouble. People can end up in the mental health system as a result of going through insight into the three characteristics. This is serious stuff. Either one. We'll talk about this a bit more at the end of this.

What Buddhaghosa's understanding presupposes is that there is a strong grounding of anattā and concentration in the meditator. But what if the practitioner does not have such a grounding? This is the question that's being raised here. If Yasa hadn't run into the Buddha...

He could have been in serious trouble.

So people can have psychological breakdowns as a result of either meditating or having an insight that a meditator would recognize as being on the curriculum. If it's personal, if it's about me, then you could go crazy.

Alternatively, fear could be turned into insight if the identification can be abandoned. So you might have someone in serious trouble recognizing the groundlessness of experience and the futility of life, but then be turned around if they can be persuaded this is not personal—it's about nature, not you.

This is the delicate balance, particularly important in Dukkha ñāṇa. Absolute centrality: do not take it personally. It's rule number one in this game. Do not take anything personally, because it is not personal. But if we take it personally, it can be dangerous, and it is dangerous, and people have serious problems.

This is the great risk of the commercial commodification of mindfulness. People are talking about mindfulness as if it's a way of developing a better self, as if it's all happy-clappy. And what happens is people start to develop insight into not-self—or maybe not even insight into not-self, but without any insight into not-self—and they're going crazy.

It happens to some people and it passes because everything passes, and they recover from it. But they're shaky. Maybe they'll just never go anywhere near this meditation spirituality again and stick to nice safe materialism. But there'll always be an edge.

There'll always be at the bottom this fear, because there'll always be the intuition that really there isn't anything down there. And it'll come out at the very latest—it'll come out at death. And they could well have a very terrifying death experience.

And then comes ādīnava ñāṇa. This is understanding of danger or disadvantage. This is essentially the recognition of the impossibility of the situation. There's no refuge. There's nowhere to escape. Any fantasy of escape is seen to be just that—a fantasy. It's just nonsense.

Then comes nibbidā ñāṇa. This is disenchantment. And disenchantment, of course—remember we talked about that in anattalakkhaṇa sutta. That's the turning point in anattalakkhaṇa sutta. And that anattalakkhaṇa sutta goes through impermanence, dukkha, not-self in a very compact way.

In nibbidā ñāṇa, disenchantment, the practitioner abandons the search for satisfaction. It's like, nothing's going to work. I can get out of this meditation center, I can go home—that's not going to work. I can quit my job, collect my accumulated savings and head off to a tropical paradise—that's not going to work. I can buy a nice new car—that's not going to work. So why not just give up? Why not just stop struggling and surrender?

The Buddha points out that these three ñāṇas—fear, danger or disadvantage, and disenchantment—are essentially the same. Rather, they're different stages of maturity in the same understanding. So in Paṭisambhidāmagga it doesn't differentiate between these three. But Buddhaghosa separates them out.

And there we get muñcitukamyatā ñāṇa—the desire for deliverance. This is also known as the "get me out of here" ñāṇa. And sometimes people do escape the meditation center at this point.

These could be the people who go rushing off into the night never to be seen again. You get different symptoms here—sometimes intense physical pain and restlessness, sometimes people who disappear into their room to sleep most of the day. "Get me out of here." It's just unbearable. "I can't stand this anymore." The mind's desperate to escape.

Notice how in these ñāṇas, affect is central. *Vedanā*—it's all heart stuff. What moves the heart is *sukha* or *dukkha*, pleasure or pain, and it's all about desire. So in this ñāṇa, desire for deliverance, the question of desire really comes down to it: What is it we want?

For the Buddha, the fundamental question is: Do we desire the constructed or the unconstructed? Our habit is to desire the constructed. This is the world we are familiar with—the real world, the world of normality. All our desires go into that world. In contrast, we don't know anything about the unconstructed. We can't, because anything we know about it is just more of the constructed. So we actually cannot know anything about it.

If we don't know about it, how can we desire it? We're caught in this catch-22. But if we become thoroughly disenchanted by the constructed—because we've learned to fully understand it—then we learn to desire something else. There must be something better than this. I don't know what it is, but there must be something better. This is the desire for deliverance.

But still, what is it that I desire?

This again brings up the question of secular mindfulness or mindfulness in the psychotherapeutic tradition. If I am in a particular practice tradition—let's say I'm working within the Theravada or some other established tradition—then I may have at least a theoretical sense of what it is that I'm desiring. What's the alternative to this construction? I can have at least some kind of theoretical understanding.

And so I can feel encouraged, even if whatever it is is completely mysterious, even if it can barely be perceived as an image in art—a thangka, a statue of the Buddha, a temple. But there's something that tells me there's something else that's better than the so-called real world. Then that desire for deliverance can have a direction, a target.

Also, if I have teachers or senior practitioners I can look up to as embodying some kind of understanding, then I can have a lived sense of what this might be. This is one of the things that John Hale gave to me as a teacher. I would look at him and I could see, "Oh, this is what the practice is about." He gave me a lived sense of what it is that I'm aiming for. And that's incredibly grounding and encouraging.

But if I'm living in an entirely secular context, then at this point I might be tempted to despair. I don't want all of this, which is familiar, which is normal, which is the real world. But what's the alternative? And I could be stuck.

So again, the dukkha ñāṇa brings up the dangers inherent in doing this practice. This practice is dangerous. We're messing with the mind.

What gets the practitioner through all this is basically *anattā*—a growing understanding of not-self, which is the understanding side, the *vipassanā* side. On the *citta* side, this is matched by a developing mindfulness and equanimity. As the mindfulness gets stronger, the equanimity gets stronger.

And of course, you've also got the concentration, so the heart is getting stronger, clearer and more settled and more balanced. So it can go through experiences which before would have completely flipped me out, but I can go through them now because the understanding of not-self is getting stronger and the heart is getting more balanced, more equanimous.

When the equanimity really starts to take off, then we move into *paṭisaṅkhā ñāṇa* or *paṭisaṅkhānupassanā ñāṇa*—review. In practice, these ñāṇas have all sorts of experiences that characterize them, but often what will happen is that the meditator will start going through all the previous experiences they've had of dukkha.

It's like marching. I remember when I went through this, one of the weirdest things was I'd sit there and it was like I was in the stands of a military parade ground, and marching in front of me was all the dukkha that I'd gone through.

Kind of marching past and saluting me as they went by. It was really weird.

But review also reviews the other characteristics as well. So it's like all the characteristics can be swimming in front at this point. But it can be like a guided tour of the nature of human suffering, but it's becoming increasingly refined. And the sense of not-self is getting stronger and stronger. So the sense of any personal threat is just fading away. And it becomes really interesting. "Wow, look at that. That's really weird. That bit of dukkha. Why is it so painful? Not enough anatta. Not enough equanimity." It gets very refined and very interesting.

I remember one time I was doing walking meditation and I suddenly realized, "Wow, even awareness hurts." That is really weird. That's fascinating.

And this ñana is rather similar to sammasana, the third ñana, except much deeper, much more refined. But again, mindfulness is developing. And mindfulness develops because it doesn't matter what it is—just be with it. Just be with it. Just be with it. Just note it. Look at it. Sometimes you can't note. It's impossible. But just be with it. Just accept it. Just face to face. This is what it is. Don't avoid it. If we're avoiding, face to face with the fact that I'm avoiding. Just face to face with it.

The mindfulness gets stronger and stronger. With the mindfulness comes the equanimity. This allows the concentration to develop. And this allows this very subtle sense of not-self to gradually come into prominence. And again, not-self is the most subtle because it's not a something. It's the absence of a something.

But when anatta becomes predominant, then the dukkha ñanas end and we move into sankharupekkha ñana—equanimity regarding all constructions. And at this point the mindfulness and equanimity dominate the heart. What's apparent is not-self, and everything's a lot smoother. And then this is where anatta is now predominant, and this is the one that just keeps rolling along.

The question of the distinction between dukkha and dukkha ñana—we could say more broadly, the distinction between psychology and Dharma. This is relevant for our culture.

Just very briefly, you could say that psychology deals with people and their problems. I would say, as a non-psychologist: Dharma does not. Dharma does not deal with people and their problems. Dharma practice cannot solve anyone's problems. If anybody comes to the Dharma to solve their problems, they're wasting their time.

What the practice can do is show us that we and our problems are empty and without self. That's Dharma's job.

In the First Truth, the Buddha is clear that the practitioner's job is not to solve their dukkha, but to understand it.

In the Four Noble Truths, the duty attached to the first truth, dukkha, is to understand—to fully understand dukkha—not to solve it, not to get rid of it. And when we understand our dukkha, we realize there is no "we" involved. That's what the Dharma offers.

As the Buddha says to Venerable Kaccāna Gotta, a mature practitioner "has no perplexity or doubt that what arises is only dukkha arising, what ceases is only dukkha ceasing." So Dharma allows us to give up on the "me" and "my problem." And when that happens, my problem is not solved—it's dissolved. It's a whole different thing.

So Dharma and psychology are two different projects. But they are not in parallel universes that never intersect. Of course they intersect. For example, we can, from our practice, learn something about our psychological makeup. And this, in turn, can help us with our practice. They can help each other.

We learn from our story. When I do the practice, I learn from my story and I create a variation of the story. My story gets a new meaning, and this meaning can be very useful because meaning is powerful. It may even give me a different mode of attention. What I'm working with when I meditate is attention. We may learn from our story—which belongs to the realm of psychology—where the best place is to aim our attention, which is in the realm of practice. What are the conditional relationships most worth exploring to shed light on our situation?

So these two are separate, but they intersect. They're not completely cut off from each other. One can help the other. But they are two distinct projects—they're not the same project.

At a fundamental level, we learn we are never going to find the right story. It's just not going to happen. All stories are unsatisfactory.

At Wat Suan Mokkh in southern Thailand, Ajahn Buddhadāsa built what he called a spiritual theater and put all sorts of exhibits inside it. He had these little paintings along the wall, and one of them showed this fat Chinese monk doing the stretch that we do in the morning where we push the ceiling up with our hands. He's got this big belly and this big grin on his face. There's a verse underneath in Thai with an English translation, and the English translation goes: "O boundless joy, now I see there is no happiness in this world."

This is the essence of the dukkha ñāṇa—the joy that comes out of it. And it's boundless, because there's no one there. There's no self involved.

CHAPTER 30

On Effort

Patrick Kearney · 1h07

> *In this dharma talk from a month-long retreat, Patrick Kearney examines the nature of right effort in Buddhist meditation practice. Drawing on his experiences in Thai and Burmese monasteries, he contrasts the "meditation as war" approach with a more balanced understanding of sammā vāyāma (right effort). Kearney explores how the Buddha's own journey from extreme asceticism to the middle way informs our understanding of skillful effort, referencing the Devadaha Sutta and the teaching given to Venerable Sona about tuning a vīṇā.*
>
> *The talk emphasizes that right effort is not about striving for future attainments but rather making the present-moment choice for intimate presence with whatever is arising now. Kearney discusses two approaches: determined effort (direct engagement with specific mental states) and intimate witnessing (upekkhati - seeing with equanimity from very close proximity). He explores how our relationship to time, self, and the reality of kileśa (defilements as "stuckness") shapes our practice, ultimately pointing toward effort as a chosen intimacy with present experience rather than a battle against ourselves.*

Tonight, by special request, we're going to talk about effort.

I mentioned many years ago that in the 80s, I spent a lot of time in and out of Thailand—in the latter part of the 80s as a bhikkhu, before then as a layman. When I was still a layman, one place I always visited was Wat Suan Mok. They had this program going where they would teach retreats for lay people, usually spaced-out hippies from the nearby tourist islands. In one of these retreats, very unusually, Ajahn Po gave us a talk. The star of the monastery was Ajahn Buddhadasa, who gave these magnificent Dharma talks, but the abbot was Ajahn Po.

He ran the place, and I was very impressed by him. He's one of the best monks I've ever come across. If you were looking for him, you were just as likely to find him up on the roof hammering a nail for the repair of the buildings as to find him anywhere else. He was in many ways a model of how to be a bhikkhu. So I had a lot of time for him, but I had never heard him give a Dharma talk. His English wasn't that good and he was a man of action rather than of words. So when he turned up to give us a talk, I thought, this could be good.

He sat down, looked at us, and his opening line was: "Meditation is war." He glared at us and said, "War against what? Defilement. War against defilement. What is defilement? Lust. Lust is defilement." He proceeded from there, but from that point he completely lost his audience—which I'm certainly not interested in doing.

But this "meditation is war" is a traditional motif to describe what meditation practice is all about. Sayadaw U Pandita was very fond of the image. He described the relationship between serenity and insight meditation: insight meditation is like you're charging across no man's land with a fixed bayonet and the enemy are just blasting away at you, whereas every now and again it just gets too much so you dive behind a boulder—and that's serenity practice.

This way of looking at meditation, which again is very traditional, emphasizes the aspect of commitment, energy, effort, perseverance, self-reliance—all those qualities. Courage, determination. The image is based on a quite realistic appreciation of our situation.

The fact is that we are stuck in our suffering, and what we want is to move towards transformation. It's up to each one of us. No one else can do it for us. Buddha is not about to descend from his altar and give us a helping hand. No amount of praying will make the slightest difference whatsoever.

In embarking on this project, what it requires us to do is to go against a lifetime of habits. We have been carefully cultivating habits which the Buddha would call akusala—unwholesome. We have been vigorously doing this for our entire lives and then suddenly we are expected to go in the opposite direction. If I don't do it now, it won't be done. So you can see where they're coming from.

As Ajahn Po pointed out, meditation is war on kilesa—defilement. Defilement is the standard translation of the Pali word kilesa, and we've spoken about this earlier in the retreat. In the Pali tradition, kilesa is taken from the verb kilesati, to stick, to adhere. The image is: if you have a white cloth and you get some mud, you throw it at the cloth, the mud sticks to the cloth, the cloth is dirtied—it is defiled. So, defilement.

But what the image is presenting is an image of stuckness. The problem is the mud is stuck to the cloth. Now there's no problem with the cloth and there's no problem with the mud. The problem is the stuckness. This is the essence of kilesa. It's literally more stuckness than defilement, but we are defiled by this condition of stuckness. In other words, by what we cling to.

It's all about our clinging. When we take up a meditation practice, we're going against these deeply ingrained patterns of clinging, launching ourselves into a journey we have never attempted before. We're heading to a destination that we have no understanding of. So, not so easy.

What this practice will reveal to us very quickly and efficiently is exactly our obsessions—what we're stuck to, what we cling ferociously to. This is what will be revealed, again and again and again, most obviously in the experience that we call distraction. This past month we've spent a lot of time talking about distraction and how to work with it.

So this image of war has got something on its side. But it does have one disadvantage, because war always entails winning and losing. In this particular war, I'm battling against myself. This is a civil war—some parts of me want to get enlightened, versus other parts of me that say, "Nah, I just want to relax. I want to keep doing what I've been doing." If I'm in battle against myself, then ultimately I have to lose. I must be on the losing side.

What inspires my heroism in this war? It's my desire for a better self. I'm not really satisfied with the self that I've got. I wish I could trade it in and get an upgraded model, but it's not so easy. I come to the meditation practice hoping that I will be improved in some way by the experience.

Now, this is a war that I'm already familiar with in my ordinary everyday life. This is the war that we see in consumerism and ambition. I don't like what I've got. I want something better. So I'm going to struggle to get it in the belief that once I get it, then everything will be okay. There's a quality of drivenness in this project. This is what the Buddha calls taṇhā—literally thirst, but usually translated as craving.

When I come to the practice, I import this relationship into what I'm doing. But the weird thing is that what brought me here is the realization of the futility of living like that. I've been on the planet long enough to realize that it actually doesn't work. I'm always struggling for something or someone better to turn up in the future, and it never does. This is what brings me to meditation in the first place.

What I find is that I import into my meditation practice the very condition that I'm struggling to escape from. It's like I am charging into battle, but the enemy is the one who is charging into battle. So I end up going around in circles.

When I get into this struggle, into this war, it's easy to forget that the only strategy that can actually win this war is what we could call presence—being present. We could call this a chosen intimacy with whatever is happening. This is a strategy of play rather than of conflict.

Play is similar to war in that it requires energy and commitment, but unlike war, it does not look forward to a result, and in particular to the right result. It doesn't look forward to anything beyond itself. When we're playing, what we're doing is just playing. We're not trying to get something out of it. We're just playing.

When we look at the pain that drives the practice in the first place—why we come here, the pain that we're trying to escape from—we realize that this pain comes precisely from our failure to be intimate with the present. We have developed a habit of hurrying towards the future, and we do this because we imagine that it will bring us closer to what we actually want.

So we're always disconnecting from this, which is happening now, because we're busy grasping something else, something that will be realized only in the future. But it will never be found now. It's always in the future. We're moving towards a better future, and we're doing this all the time. Of course this has become a whole ideology—an ideology of progress.

But when we do this, we find that we're permanently disconnected with what's actually happening now. And this disconnection guarantees that our pain keeps going, continues.

So what we're looking for is a sense of play, which is the practice of this moment for its own sake.

When we're battling for something, what we are battling for is always something that will come in the future. And right now we can know it only in the form of an image that the mind throws up—an image. So we're disregarding the present in order to lean forward and hold onto an image which, when we look at it, has power over us precisely because it feeds our obsession with ourselves. Because the images that constitute our imagined victory are all characterized by a very strong sense of "me finally arrived at the place that I've always wanted to be"—because in that place I become the person that I've always wanted to become, no longer this person who isn't good enough, he's never good enough.

So this relationship to the practice is always looking forward, projecting forward, leaning forward, grasping forward. And that necessarily results in a disconnection with the actual experience that's happening now.

Now, before the Buddha became the Buddha, when he was still Siddhartha and a Bodhisattva, that was exactly the trap that he found himself in. And we talked about this earlier in the retreat when we were talking about the middle way. In his later years, he was reminiscing with his students about what he did in his ascetic practices before he attained awakening. And he described his practice, his approach to practice in this way:

"I thought, suppose with my teeth clenched and my tongue pressed against the roof of my mouth I beat down, constrain and crush mind with mind. So with my teeth clenched and my tongue pressed against the roof of my mouth I beat down, constrained and crushed mind with mind. While I did so, sweat ran from my armpits."

So we've already gone through this passage. Siddhartha was crushing mind with mind. He was definitely at war.

And to do this kind of practice, he must have been looking for a result. He must have been looking for something which would happen next—some reward for his effort. So he had an image of himself as being fully awakened, and he wasn't prepared to settle for anything less. That's why he walked out of his previous practice communities. And if only he could work hard enough, he could fulfill that ambition.

And the ascetic practice is the practice of the macho workaholic: "I've just got to work harder." And if he was not yet awakened, then obviously he wasn't working hard enough. So he had to work harder and harder and harder.

And it got to the point where, as he explained to his students many years later:

"I thought, whatever painful, wracking, piercing feelings due to exertion practitioners have experienced in the past, in the future, or in the present, this is the utmost. There is none beyond this."

It's like, what is humanly possible to do? I have done. I cannot work any harder. I can't even keep working this hard for very long because I'm going to die soon from my effort.

And he goes on to say: "Yet I have not attained any state surpassing the human by this racking practice of austerities, any distinction in understanding and seeing worthy of cultivated ones."

So you could say that Siddhartha found himself in the situation in which he had won the race. No one was as hard working or as effortful in his practice as he was. He had succeeded all expectations in his performance review. And yet, still, it wasn't enough. He still hadn't attained what he was looking for. He still hadn't attained peace.

Now—and this is another issue that we've been talking about during this retreat—you notice that when Siddhartha was doing this kind of practice, he was caught up in the reality of time. Time, to him, was very real. Now I suffer. Later I'll get the payoff. And I'm putting up with this suffering now because of my belief in the future payoff.

Later on, in the Sweet Essence, which we also went through, we saw that if he's obsessed with time—with the reality of time, the belief in the future and in the past—then he was caught up in papañca, conceptual proliferation, as we translated it, or complication. In other words, his conceptual mind is in hyperdrive.

And when we're caught up in time like he was, then we're also caught up in self, because the self requires time. I can't believe myself to be me without a felt sense of the reality of the past and the future. It's incoherent for me to believe that I am Patrick who is the teacher without a sense that I came in here before and I will leave later. Without that, I can't sustain the identity.

And our relationship to time and to self is closely related to our relationship to effort. So we're striving to get something. This very project assumes the reality of the future. It assumes the reality of the image that I have in my mind of what it is that I'm striving to get. It assumes the reality of the one who is doing the striving and the one who will be finally triumphant over all difficulties and achieve whatever it is that I'm trying to achieve.

And we find it frustrating because no matter how hard we try, what we're looking for hasn't arrived yet. Sometimes it turns up briefly, but then it crumbles. So we've got to start again.

And since what we want isn't happening, we assume we must make more effort. Obviously we're not trying hard enough. So we push harder, or we collapse in exhaustion because it's all too difficult. We pick ourselves up off the floor and try again, only to collapse once more. Try, collapse, try, collapse. And we get caught up in that civil war we've been discussing.

I'm reminded here of my old teacher, Sayadaw U Pandita, who tended to encourage this kind of relationship. His catchcry, at least what I remember from many years ago, was basically "more effort." Make more effort.

In the traditional Mahasi approach in Burma, people would undertake two or three month retreats. The bhikkhus traditionally observe vassa, a three-month retreat period each year, so a three-month retreat is very traditional. Lay people, who comprised most practitioners at these centers, settled on two or three months as an appropriate duration because they felt this gave enough time to develop the momentum required for meditators to attain the first stage of awakening. If they didn't achieve this in that period, they were much better off going home, taking a break, and returning the following year.

The government at the time—this was early independence, from the late 1940s into the 1950s—actually encouraged this kind of project. If you were a civil servant in Burma, you could take meditation leave, paid leave to go and meditate, because the government was very enthusiastic about supporting this practice.

When they began bringing in foreigners, however, a different dynamic emerged. You had people coming from the other side of the world who managed to land in Burma. Once they left, the teachers had no idea whether they would ever see them again. So if they were there, the teachers wanted to keep them there until they achieved results. The problem was that Westerners proved much slower than the Burmese in making progress. Burmese practitioners advanced much more quickly. Westerners were very slow.

So they needed more time. The attitude became: you just keep going until you crack it. Just keep going. People would stay six months, a year, two years, doing this very intensive practice—compared to which what we're doing is a holiday camp.

During my time there, the foreigners had their own meditation halls, basically because the Burmese were so fascinated by foreigners who came to meditate. They always divided by gender—men's meditation hall and women's meditation hall. There were more women's halls because many more women meditated than men—at least two women's halls and one men's hall.

Every single day in the men's hall, at least one Burmese lay meditator would approach me because he was so happy and pleased that a foreigner was coming to practice Buddhism. He simply had to talk to me and express what a wonderful thing it was. So every day you were being interrupted by these enthusiastic characters wanting to talk. Eventually, the teachers created a separate meditation hall for foreigners to protect them from the curiosity of the Burmese. We had the foreign meditators' men's hall where I used to sit.

There was a period when this hall became characterized by the greatest epidemic of sloth and torpor I have ever witnessed in my entire life. It was phenomenal. I used to meditate with my eyes open because of my early Zen training, so I could see all of this. It was a marvelous symphony of sloth and torpor going on all the time. And strangely enough, people were not making very good progress.

The atmosphere, the culture, was one of heroic effort. You would hear muttered conversations. According to the schedule, you were allowed to sleep four hours per night. If you wanted to know why, the answer was simple: Buddha slept four hours. If it's good enough for Buddha, it's good enough for you. So four hours of sleep per night was scheduled.

Sometimes you would hear these whispered exchanges: "How many hours are you sleeping?" "Four." "I'm sleeping three." There was this macho drive. And of course, everybody was completely exhausted and falling asleep all day in the hall, completely bogged down.

U Pandita felt he had to stimulate something, so he gave us a talk about effort—the three stages of right effort. He compared it to a three-stage rocket, being very scientific. The first stage has enormous engines and incredibly powerful thrust, and the rocket starts to rise, defying gravity.

Heroic effort, heroic effort.

And then finally you get some momentum and the first stage drops away—it's the second stage. And then you have to make more effort, more effort. And then finally you get into orbit and the second stage drops and you've only got the third stage. And what do you do? You make more effort.

He hammered on for about an hour. I don't know about anybody else, but I was utterly demoralized. One of the meditators went to see him later, privately—not even through the interpreter—and said, "Sayadaw, I can't even make it to the first stage of heroic effort. Am I just wasting my time here? Should I just go home?"

And he said very quietly, "Look, don't pay any attention to what I'm saying. I have to say these things. Just pay no attention. Just pay no attention. I have to say these things."

So it was very strange. We were caught up in this culture gap. The teachers had to say certain things, regardless of whether or not it was a good idea. That was their job. That was what was expected of them. Their job is very tightly controlled by the culture.

And I noticed one night, according to the schedule, the hall would close at 9 PM. There was an 8 to 9 sitting. From 9 to 10 PM there was walking meditation outside. From 10 to 11 was the final sitting period, which was done inside your room. Eleven o'clock, go to bed. Four AM, get up. Hall opens at 5 AM.

One night I came out of the hall for the 10 to 11 walking meditation. I was doing my walking meditation and I stopped and I looked around and I thought, "Where is everyone?" And I realized, of course, all the Burmese have gone to bed. Obviously. And they'll be in the hall at 5 AM the next morning.

In other words, in Burma, Burmese are quite relaxed. Now, if you want this much effort out of a Burmese audience, you demand this much. But if you've got fanatical foreigners who've gone all the way there to attain enlightenment and they hear the demand for this much, what they'll try to do is this much. So a lot of this was cultural confusion that was going on.

But this rhetoric of "more effort" is very characteristic of the Burmese, and frankly a lot of it is just kind of PR. It's not to be taken all that seriously. But people have got caught up in it.

If we're looking for what the Buddha calls right effort, samma vayama, it's found in the commitment to recognize what is already here. It's got nothing to do with what we imagine might happen in the future. This I think is really important.

Right effort has got nothing to do with what we imagine might happen in the future. I'm not striving for anything. What I'm striving to do is to recognize what is already here.

So let's look at how the Buddha speaks about effort. We'll go through a few texts. There's one discourse called "An Auspicious Night." And the center of it is this verse about the practitioner. Just a little bit that I want to present here.

The Buddha says: "Do not run after the past, nor long for the future. The past is left behind and the future not yet reached. Instead, see deeply into each presently arisen phenomenon while neither scattered nor disturbed."

So, first of all, the relationship to time. Do not run after the past nor long for the future. Time gets in the way. And time presents itself as mental images. That's all it presents itself as. And these images, of course, can be accompanied by a great deal of energy that we feel in the body and in the mind.

So coming to the end of a retreat, typically most people's mind thoughts are preoccupied by future rather than past. And images of the future have a very strong flavor of reality and they stimulate a lot of energy. We've built up a lot of energy in the retreat and now this energy is being harnessed by fantasies about the future.

The future comes to us only as a concept, only as an image. So do not run after the past nor long for the future. The past is left behind, the future not yet reached. In other words, they don't exist except as presently experienced phenomena.

Instead, see deeply. This "see deeply" - the verb in Pali is *vipassati*. The noun is *vipassana*. So we know vipassana as insight and we normally see it as a noun, but it's also a verb: the verb "to insight," and here translated as "to see deeply." But insighting is an activity; it's something we're meant to do.

Instead, see deeply into each presently arisen phenomenon. It can only be done in the present. The object of the investigation can only be the present, because that's all that exists. We cannot insight past or future. We cannot insight our past records of failures. We cannot insight our hopes and desires for the future. We can only insight this, now.

Now it's possible that right now is arising thoughts of the past or the future. We insight them as they arise. But you notice that the relationship to time is one of dismissing the reality of time and just staying with the present. The practice can only be done now, and the result of the practice can only be experienced now. We cannot experience a future result. It just cannot be done.

So what we're looking for is a sense of commitment and a relationship to the present which is characterized by a sense of harmony. And there's a pleasure in it, because with this relationship we no longer need to look to an imagined future for something we feel is missing now. That relationship is painful - it's *dukkha*. The sense that there's something missing and I've got to grab something in order to ease the present suffering. But when we don't have to look to an imagined future, there's a sense of ease, balance and harmony in that relationship.

And as we said, we find this relationship in play. When we play, we're doing... Well, the opposite of play, to me, is work. And when I'm working, I'm doing something now in order to gain something else later on. So when I had a day job, I would turn up at the office, not because I particularly wanted to turn up at the office, but because at the end of the week I wanted the cash. This is work.

Now, one could, of course, go to the office and play, which would be a much better relationship. I sometimes find that relationship in my work, and it's really nice when I find myself doing something and I forget about anything else - because I'm not looking for a future result, I'm just doing it for the sake of doing it. And there is an ease and a pleasure in that relationship. When we're playing, we have nothing to gain and so we have nothing to lose, and it's a whole different relationship.

And so in this practice we've been emphasising the play aspect. Don't stress out. Plenty of time. No set schedule. Explore. Be interested. Be curious. What's going on here? What's this all about? Try this. Try that. Experiment. See if this works. See if that works. If you're interested in it, go for it. All of these kinds of structures and instructions are designed to try to cultivate a sense of play, which has a lot to do with effort.

So in one discourse - and we've looked at this before - the Buddha compares right effort to music. And this is the famous story about Venerable Sona. Sona, as we said, was a rich young man who got religion and became a bhikkhu, and he was one of these young macho types who was determined to make it to full enlightenment as soon as possible. But he was becoming disheartened because no matter how hard he worked, he wasn't getting a good result. So he would work harder, but he still didn't get a result, so he worked harder.

And he was just getting completely fed up with the whole thing. And the Buddha was called in to talk to him, and of course the Buddha would have recognised exactly this pattern because that was what he did when he started out. So the Buddha spoke to him about his practice of music when he was a layman. Sona played the veena, which is an earlier version of the sitar - a stringed instrument. And the Buddha asked him to reflect on his experience as a musician: "When the strings on your veena were too tight, was it well tuned and easy to play?"

Well, no.

When its strings were too loose, was your Veena well tuned and easy to play?

No.

When its strings were neither too tight nor too loose, but adjusted to a balanced pitch, was your Veena well-tuned and easy to play?

Yes.

So too, Sona, if effort is too forceful, this leads to agitation, and if effort is too weak, this leads to stagnancy. Therefore, resolve on a calmness of effort, attain balance of the faculties, and there take up the meditation theme.

Avoid being too forceful, avoid being too weak. If there's too much force, there's some kind of agitation. If there's not enough effort, there's a sense of stagnancy. And so finding right effort is very largely a matter of recognising wrong effort and having recognised it, doing something about it.

So is there a sense of strain, of agitation within the citta, within the heart-mind? Maybe I'm trying too hard. And maybe that trying is a pushing away of something I don't want to see, or a desperate grabbing onto something in my obsessions.

Is there stagnancy? Is there a dullness in the mind? So what's happening there? And if I need to stimulate energy, how would I do it? It might be simply getting up and walking or moving in the open air. Or it might mean more effort in the sense of closely focusing on the meditation object.

But there's a continual tuning of the instrument that's required. And the tuning is effort. The effort factor is this process of tuning the instrument so it's just right, not too tight, not too slack. And we can tell that's the case when the music comes out satisfactory. So it's the quality of the music that tells us where we are.

In another discourse at Devadaha, the Buddha addressed this whole issue of too much effort. This discourse is quite interesting. It's very philosophical. And it's a debate that the Buddha has with Jain ascetics. And one of the reasons why it's interesting is because he's debating, as it were, with his former self. When the Buddha was practicing, he did this ascetic practice and he recognised what was wrong with it and its futility, and then he discovered what actually works. So now he's talking to other people who are caught up in that same ascetic practice and he's putting the boot into them and he knows exactly where to aim it because he was in that same boat.

But there are also some philosophical aspects as well which are quite interesting. The Buddha spends a fair bit of energy tearing apart the idea that everything that happens in the present is the result of past karma. And that view has crept into Buddhist traditions although he did his best to actually get rid of it.

But anyway, at one point, he gets onto the question of how action and effort can be fruitful. He often used agricultural metaphors. So I'm working in the fields. I want a fruit. I want a result. So how can I practice in such a way that I will get a result?

So he says, how is action fruitful? How is effort fruitful? Here a practitioner is not overwhelmed by dukkha and does not overwhelm himself with dukkha. He does not give up the pleasure of the dharma and is not infatuated with that pleasure.

So it's interesting that he starts with the question of pleasure and pain. If we have this habitual attitude of too much striving, practice becomes a bitter pill that we have to swallow if we are to get well. So we may be overwhelmed by dukkha or overwhelm ourselves by dukkha, bringing too much pain into the practice when it's actually, at best, not necessary. At worst, it just gets in the way.

So the first thing he does is draw attention to issues of pleasure. He does not give up the pleasure of the Dharma. Literally, it's dhammika sukha, dharmic pleasure. And this pleasure of the Dharma has a lot to do with again the relationship to time. So in that discourse on an auspicious night, the night is auspicious precisely because of the giving up of past and future. When we live in the present, there is a pleasure in that. So when I'm present...

This ordinary everyday experience can give us tremendous pleasure—the pleasure of the weather, the environment, the simple joy of walking along a veranda when we're truly present to the experience. So he does not give up the pleasure of the Dharma and is not infatuated with that pleasure. It's always a balance. Again, don't grasp onto it and try to make it into something more.

He understands: "When I make determined effort, this particular source of dukkha fades away in me because of that determined effort." And: "When I intimately witness, this particular source of dukkha fades away in me as I cultivate equanimity."

So he gets to what we actually do, and you notice how adaptable the model he's presenting is. First of all, the kind of practice varies depending on one's understanding of dependent arising. Throughout this retreat we've returned again and again to this basic principle of dependent arising. Whatever happens in experience happens because of something else. This arises because something else arose, and this ceases when that ceases.

In the Four Noble Truths, the basic model he presents examines the relationship between craving and dukkha. When craving arises, dukkha arises. When craving ceases, dukkha ceases. So the idea is looking beyond not just the meditation object itself, but beyond it to the network of relationships within which it's embedded.

The experience of practicing is changing. Why is it changing? Something is happening that feeds this. So this particular bit of dukkha, this particular unpleasant or painful situation, has a source, a cause, a condition. The word the Buddha uses here is nidana,

which we've referred to before when discussing the sweet essence. It's part of the basic language of dependent arising. As soon as someone hears this word, they know he's talking about dependent arising—the whole web of interrelationships.

Notice he's saying "this particular source of dukkha." He assumes we're paying close attention to experience, that we can distinguish this particular source of dukkha from that one. So there's a sensitivity, a refinement assumed in the practice. It's assumed that we're studying the flow of experience, interested in how one thing leads to another. Different situations require different responses.

This is the key point: it's not one-size-fits-all. It's not just "make more effort," nor is it just "make less effort." Sometimes you find fashions in meditation practice. The Burmese emphasize the "make more effort" model. When teachers came out of Burma and started teaching in the West, they tended toward making more effort. Then, when they noticed students tying themselves in knots, they said, "Well, maybe not." Then other forms of meditation practice emerged, very consciously saying, "Don't make more effort. Don't make too much effort at all. In fact, don't make any effort. Just sit there. Whatever happens is meditation, so don't worry about it. Just let the mind cruise along. You just be there for it. Don't make effort."

So you get shifts from one fashion to another. But what we see in the early teachings is that it's never one-size-fits-all. Sometimes, yes, more effort. Sometimes, definitely less effort. It's a question of being able to discern which is appropriate. This requires skill from the meditator.

The two forms of practice the Buddha describes are: first, determined effort. This is very familiar—this is the Burmese way. This involves directed attention, deliberately directing attention to something, possibly aimed at directly challenging a problem.

A problem has arisen, bang—just go for it. So for example, the mind is dull. I practice in such a way as to stimulate energy. The mind is dull, so I put more effort into directly confronting that dull state of mind. How do I know the mind is dull? What are the symptoms? Oh, well, there's heaviness. Is the heaviness in the mind, or is it in the body, or is it both? Pay attention. Really look at it. Go straight into the center of it. This is applying determined effort aimed directly at the problem.

Or the mind is restless. So I practice in such a way as to deliberately calm the flow of energy. Deliberately bring it down. I'm doing something to address this. In either case, I directly confront the situation and I do something about it, but it's something aimed at this particular situation. It's precisely aimed. And to accomplish this, I need what we talked about early in the retreat: sati sampajañña, mindfulness and clear understand-

ing. We talked about it as mindfulness being essentially presence, and clear understanding being the intelligence associated with that presence. So intelligent presence. We're bringing our intelligence to the project.

So sometimes determined effort. And sometimes intimate witnessing. When I make a determined effort, this particular source of dukkha fades away in me because of that determined effort. And when I intimately witness, this particular source of dukkha fades away in me as I cultivate equanimity.

Now this intimate witnessing is a compound verb based on the verb upekkhati, which is a verb we do not have in English, as far as I'm aware. It's "to equanimize." You know the noun equanimity. This is the verb "to equanimity." I don't think we have a verb for equanimity, do we? "Equanimize" is pretty good, though that's my invention. It's like two words, like "with equanimity"—doing something with equanimity added on, but "to equanimize" itself. It's a verb in Pali and Sanskrit. And again, it's an activity.

It's interesting that when you look at the basic terms that the Buddha uses, their nouns, they're all based on verbs. They're activities. This is typical of the Buddha's dynamic approach. A thing is its activity. Its identity is what it does.

Anyway, this verb, which we've already mentioned actually, comes from the root īkṣ, "to see." So this is seeing, and you get the prefix upa, which denotes nearness or close touch. So seeing. Now seeing implies a direct, present engagement, but it also implies distance. If I'm seeing something, I'm separate from it. And then you add upa, which denotes nearness or close touch, so I'm seeing it, but from very, very close by.

So this intimate witnessing—very, very close, but there's a detachment, so I'm not getting caught up in it. I'm separated out from it, but I'm very, very close to it. Have you ever had that kind of experience when you meditate? It's like really, really, really close, but it's not like boom, you're in it. You haven't fallen, haven't entangled yourself in it.

There's that sense of separation, but very close by. And this is equanimising. This is *upekkhatī*. So intimate witnessing. Bhikkhu Bodhi translates it as "looks on with equanimity."

In this state, there's no attempt to influence anything. They're not doing anything with the experience, just staying really, really close to it. Mindfulness becomes strong, it becomes continuous. Remember when we talked about the chorus in the Satipaṭṭhāna Sutta—the Buddha was talking about *sati*, mindfulness, and then he talks about *paṭisati*. The *paṭi* denotes continuity and depth. So when the mindfulness becomes strong, clear, continuous, equanimity develops. And the mind comes into its own natural balance. The *citta* comes into harmony.

When the mind changes and it comes into harmony, then the object known by the mind changes. And again this is dependent arising. Change the mind which is experiencing something and the something changes. Change the something and the mind that knows it changes.

So this is a more hands-off approach than determined effort. This is not trying to do anything with it at all. It's just staying intimately present to it. And the Buddha says, "When I intimately witness this particular source of *dukkha*"—and again it's particular, it works with this source of pain, not with that one, but this one—"this particular source of *dukkha* fades away in me as I cultivate equanimity, as I develop equanimity."

The suttas are very compact, so you don't usually get much in the way of examples. When it comes down to it, for me, right effort is essentially a matter of choice. You could say that presence is a chosen intimacy with whatever is happening now. It's just what's happening now. It's got nothing to do with past or future. It's just now. And staying present to it, but that presence requires a choice.

This choice is unusual because, as we started off by saying, our obsessions are habitual. So we keep making the choice to pursue our obsessions, and we do it out of sheer habit, apart from anything else. Because we've been doing this for decades. So it seems hard to make the choice to be present to this now. Essentially it's just a choice.

One sign of wrong effort is when any hint of tension develops in the body, because it's not physical. It's a choice. And if there's any kind of striving towards past or future, then there's too much. There's something extra added to it. It's a choice now.

But the thing about this choice is that it has to be made now. This is something I realized in Burma many years ago. I discovered when I started practicing there—I discovered with some horror that the project was to stay continuously mindful all day. And when I thought about the enormity of this task, I realized I can't. It is absolutely impossible. I could never do this. But then it occurred to me that what I could do was be mindful now. And so it's this relationship to the present which is central to effort. It's not about doing it all day.

It's about doing it now. And this "it" is a choice—the choice now to be present to this which is already happening. It's the relationship between this not-past-and-not-future now, while still tracking the cause and effect of dependent origination. Because it's observable now.

This brings us back to something we touched upon at the very beginning when we talked about mindfulness as remembering the present. In modern dharma discourse, usually when people say "the present," they will add the word "moment"—the present moment. You'll notice I've been careful to avoid this language. The Buddha does not use the word "moment" when he talks about the present.

If you think about it, what is a moment? A moment is a very brief period of time which, if you blink, you'll miss it. It's merely the preliminary to what's going to happen next. We can think about the present as a moment partly because of our rushed relationship to time normally. For us, the present is rather like a transit lounge in a major airport—we land, restlessly hang out, and then dash off somewhere else. We're always going somewhere.

But this understanding has a lot to do with our technology. We can measure time in ways that in the time of the Buddha they couldn't even conceive of. They had a very different relationship to time. For them, I think, the present was not a moment—it was a space.

Remember at the very beginning of the retreat I suggested the meditation experiment: see if you can find the border between this present moment and the future. See if you can find the point where the present becomes the future. Because if it's a moment, a moment is very small and has very clear boundaries. So can you find the border where the present becomes the future? Can you find the border where the past becomes the present?

No. All we've got is the present. That's all we have.

So even when I'm tracking cause and effect relationships which are linear over time, when I'm tracking them they're all in the present. It's a big present. But it's present because it's what is being seen, heard, smelt, tasted, touched, or minded now. It's the nowness which is crucial. And the nowness is not some tiny little moment.

What gets in the way of this practice is not distraction. Distraction is not the enemy of this practice—it's the content of the practice. What gets in the way is habit. Because when we get lost in habit, we go unconscious, we sleepwalk. And that is the opposite of mindfulness.

If you look at habit—the habit that gets in the way of our practice—how does it present itself to us? It presents as a choice made now, but unknowingly. I make the choice to drop into this thought stream, but I don't know that I've made the choice. I wake up to it later.

The practice presents as a choice made now, but knowingly. That's the difference. It's knowing that choice. But the effort, the work, is always to remain present to this now—not to get caught up in past and future.

Any questions or comments?

"You mentioned you know right effort when you do wrong effort. Do you think that's true of a lot of the right view, right intention, right speech, etc.?"

I think that's the way we learn things. It's like we learn by doing and we make lots of mistakes. So making mistakes is very important, if not essential. But of course, we get a feel for it at some point.

So we develop a feel for right effort, and again it has much to do with our relationship to time—when past and future are either not there at all or simply not pulling at us. They might remain in the background, but they're not exerting their usual gravitational force. There's a sense of flow and ease, an absence of strain, yet with clarity intact.

You can cultivate a taste for this quality. You can learn to recognize it. And in that recognition, there's pleasure—the pleasure associated with Dharma practice. Once you develop a sense of this pleasure, the mind will naturally incline toward returning there. It's like discovering a beautiful garden; you want to visit again and again.

Whereas when practice is strained and forced, the mind naturally resists returning. It has to be flogged back into that state, which creates aversion rather than attraction. The wise path cultivates the conditions that make the mind want to return to wholesome states, not because it's forced to, but because it recognizes the genuine satisfaction found there.

Thank you very much for listening.

CHAPTER 31

The Awareness Game (Workshop)

Patrick Kearney · 1h03

> *In this opening workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney presents a fresh approach to understanding awareness (viññāṇa) as the foundation of all meditation practice. Rather than using the philosophically loaded term 'consciousness,' he defines awareness simply as 'the presence of whatever is present' — comparing it to light that reveals objects without itself being seen.*
>
> *Kearney challenges the assumption that meditation requires heroic effort, contrasting the intensive approach of Sayadaw U Paṇḍita with the lighter touch of Sayadaw U Tejaniya. He emphasizes that awareness is already happening naturally — it is an elemental quality of nature that the Buddha classifies as a dhātu (element). The key insight is that we don't need to create awareness through effort; we simply need to remember it through choice. He introduces the verb 'to aware' (from the Pāli vijānāti), noting that Mahasi Sayadaw's instruction 'to note' was originally this same verb in Burmese.*
>
> *Through two practical exercises — the 'awareness game' — participants explore dropping in the mental reminder 'aware' and then naming what sense door is active (seeing, hearing, touching, minding). The discussion reveals how awareness presents as a dyad of subject and object, how different personality types (including those with ADHD) experience awareness differently, and why the Buddha placed mindfulness of body (kāyānupassanā) at the center of the Satipaṭṭhāna practice. This playful, curious approach sets the foundation for the intensive retreat ahead.*

This morning we're going to start the retreat by talking about awareness, because if we're doing a meditation practice, everything that we do revolves around awareness itself and our relationship with awareness. Getting this right is absolutely central. So we're going to begin with talking about what we mean by awareness.

The term the Buddha uses is *viññāṇa*. Classically you see it translated as consciousness. I prefer to avoid that translation because the English word "consciousness" has been used extensively in Western philosophy and it's acquired all sorts of technical connotations that don't really apply. So I prefer to use the word "awareness." It's more basic.

If we ask, "What is awareness?" we could say that awareness is the presence of whatever is present.

What does that mean? We could start with something quite basic, like seeing. For example, right now, are you seeing? Is that happening? If your eyes are open, then the answer is probably yes. And what does it mean to see? Doesn't that mean that there's a visual field in front of you? This room and the people in the room are present to you. Since they are present to you visually, you see. There is visual awareness. Awareness is the presence, the fact that something is present.

In the case of seeing, awareness is not the room. It's not the people in the room. It's the fact that the room and the people in the room are present.

Now, as a result of decades of intensive meditation practice, I've developed a supernormal power which enables me to make you completely disappear. I'll show you. You're gone. You are no longer present. Oh, you've come back. You are present. Absent, present. Awareness, visual awareness, no visual awareness.

You can see on the one hand how simple it is. But on the other hand, do you remember the discovery that you could make the world go away by shutting your eyes when you were little? Did you ever make that discovery? Was it an amazing discovery? It was quite mind-blowing. But now, of course, we just take it completely for granted because we take awareness for granted. We're never actually aware of it.

This is awareness, and as you can see, it's the most obvious thing in experience, because you cannot have an experience without awareness. If there's an experience, there's awareness. But it's also the most mysterious thing because we never pay any attention to it. In the case of seeing, we pay attention to what we are seeing. We assume that what we are seeing is what's important—that's what it's about. We never pay any attention to the fact of seeing, to the awareness itself.

So it's obvious, but it's mysterious, because awareness isn't a something. It's the presence of something. We tend to overlook it because it is so obvious that we just don't notice it anymore.

But when we take up a meditation practice, we become interested in awareness. This is the central fact that we begin to get interested in.

Awareness has been compared to light, and it's quite a good simile. We have the expression, "he saw the light." But do we actually see light? We can argue that no, we don't see light—we know there is light because we see things.

So is there light in this room? Yes. How do I know there's light? Because the room is present to me. But I don't actually see the light. I see you. Therefore, I know there's light.

Awareness is like light. We know that there is light because the world is present to us. We know there is awareness because the world is present to us.

Imagine stepping into a dark room at night, a room which is completely dark. We step into it. What is present to us? Only darkness. We switch on the light and suddenly the room and everything in it is present. The quality of presence is awareness. The room and everything in it is the object of awareness—it's what we are aware of.

This brings us to the object of awareness. If there is awareness, there is an object of awareness. In other words, there is something we are aware of. If I'm aware, I am aware of something. If I'm seeing, I'm seeing something. If I'm thinking, I'm thinking something. This something is the object of awareness.

Usually when we talk about meditation practice, we often discuss it in terms of the meditation object. The most popular meditation object is probably the breath. "I want you to sit there and for the next hour be aware of your breathing." In other words, the object of awareness is the breathing. But notice—that's not the awareness itself. The awareness is there as well.

So when we're working with awareness, we have the object of awareness—what we are aware of—and we have the awareness itself. They always go together.

Awareness is something which is already happening. It's part of nature. The Buddha classifies it as an element, an elemental quality of nature. It's already happening. We are already aware. We don't have to do anything to be aware.

In the Buddhist tradition they say it is the mind's nature to be aware of an object. That is what it does, and it does so regardless of whether or not we want it to. It just does it.

So for example, if I ask myself the question, "Am I aware now?" the answer is always yes. Always. One hundred percent. And if I ask myself the question, "Am I making any particular effort to be aware now?" the answer is no. It's just happening.

So awareness has this quality of being already here. There's nothing we have to do in order to be aware. And this can be interesting from a meditation perspective.

Years ago, when Sayadaw U Tejaniya first came to Australia, he opened up his retreat by asking the punters, "Are you aware now?" To which the answer, again, is obviously yes. Then he asked the question, "Are you making any particular effort to be aware

now?" And the answer to that question is again, obviously, no. But then he added, "That's all the effort you ever have to make in meditation practice. You never have to make any more effort than that."

I have to say that came as a bit of a shock, because I was trained in the U Pandita school of Mahasi meditation, which is all about more effort. So there was a bit of discombobulation there. And we are going to explore this whole issue of effort in the meditation practice. Of course it's particularly important if we're about to embark on meditation for a month.

Let me channel U Pandita: "Can you make heroic, unceasing, relentless, remorseless and heroic effort for a month without a break?" Nope. Maybe not. Or you could try the Tejaniya approach: "Can you manage to notice that you're already awake?" It's quite a different approach. So this is the sort of thing that we want to explore.

Let's look at it in this way. Let's try another question. Right now, are you sitting? Is there anyone in this room who's sitting? Yes? Very good. How do you know? How do you know you are sitting? Well, don't you just know? In other words, we are already aware of our posture. We already know we are sitting. It's already available. There is this basic awareness of, essentially, how the body occupies space, and it's already available.

But did you notice any difference between your awareness of the fact that you were sitting before I asked, and your awareness once I asked? Was there any change?

Now, the English word "awareness" is pretty much always presented as a noun. But awareness also indicates an action. Notice the difference between these two questions: "Are you aware you are sitting?" versus "Can you aware your sitting posture?"

The first question is asking you about your state of being. Are you aware or not? How are you now? The second question, "Can you aware your sitting posture," is asking you to do something. In English, we don't use awareness as a verb. But in fact, it does work as a verb—the verb "to aware." In Pali, there is such a verb, *vijānāti*, from which we get *viññāṇa*. In Burmese, there is also such a verb.

Those of you familiar with Mahasi's approach to meditation, have you heard the expression "to note"? You must note this, that, or the other. Now, the use of this verb is somewhat confusing. When Mahasi was teaching in Burmese, he used a standard Burmese verb which essentially would be translated as "to aware." But when his English-speaking Burmese students were translating him into English, they scratched their heads and said, "But English-speaking people don't say 'to aware.' So we have to use another verb."

So they came up with the verb "to note." But of course that creates all sorts of confusions, because for us "to note" means to make a note—so it's conceptual. But when Mahasi talks about his approach to meditation, he talks about noting, and what he means is to aware. This awaring is absolutely central to everything that he's talking about.

And if we ask, what is the source of awaring? Of awaring as an action? Where does it come from? What's its origin? What is its source? Is it effort? I would suggest no. Effort has got nothing to do with it. Effort comes later. Effort comes in the commitment to renew awaring. But what is the source of awaring? Where does it come from? Essentially it comes from choice—the choice made now to aware.

So this morning, as we play around with awareness, forget about effort and just choose. And you notice that with choice, we do not try to choose. That is complete nonsense. We just choose. Even if we refuse to choose, that's a choice. We don't try to choose. Trying, effort—these have got nothing to do with choice. We simply choose. And we do it now. It's really that simple.

So what we're going to do is play around with the choice to aware, just to get a sense of it. We want to develop the habit of choosing to aware. And to get a sense of it, we're going to play a game—the awareness game. It's important to emphasize that this is a game. In other words, do not try to play this game. If we try, if we're making effort, we're making something that is not heavy seem heavy. So don't make it heavy. Just play. Don't try. Do not make effort.

The game is this: we'll play it for about five minutes. Now, this is not meditation practice, so there's absolutely no need whatsoever to maintain any sort of meditation posture. There's absolutely no need whatsoever to stay in the hall. At the end of five minutes, I'm going to go outside and ring this bell, so if you're wandering about, just come back in after about five minutes. You can stay here if you want to. You can sit if you want to. You can wander around if you want to. You can lie down if you want to. You can go outside if you want to. Just do whatever you like—it doesn't matter.

But remember to mentally name "aware." In other words, every now and again, just drop in the word mentally: aware. Just doing whatever you're doing—aware.

Now, the idea is that when we drop in this word "aware," we are reminding ourselves that we are aware. We're not doing anything to be aware. We're just reminding ourselves: oh, that's right, I'm aware. And no effort is involved because mind is already aware. It's just a question of remembering—remembering to drop in the word "aware."

So do that, and just check to see what you are aware-ing. It can be anything. It doesn't matter what it is. Just notice the fact that you are aware-ing. And don't be concerned with how long this awareness lasts. It may not last very long at all. You may realize within seconds, whoops, I've completely forgotten. How long the awareness lasts is not the issue. The issue is to remember to drop in that word, "aware." And when you do it, see what happens.

Again, we're not concerned with what we are aware-ing. It can be anything. Just aware. That's all.

A student asked, "By dropping that word 'aware,' isn't it encouraging an effort?"

Find out. See if you're making effort when you do that. And if so, where is the effort? This is a game, an experiment. Let's see what happens. What we're trying to do is just become familiar with the territory. Now it's weird because we're already familiar with it, but we're so familiar with it we don't notice it anymore. So you just want to notice it. What does happen?

Beginner's mind. Don't take anything for granted. Just play with it and see what happens.

Another student raised the awkwardness of the expression: "Is there any reason it couldn't be 'to be aware,' which is more familiar?"

It's much more familiar because "to be aware" is the way we normally use it. And it turns awareness into a noun and describes our state: I am aware, I am not aware. But we are trying to get a sense of aware-ing as an action, as an activity. And it is unfamiliar. Even with consciousness—there is the verb "to cognize," but you don't see it used very much at all. In our culture, we simply do not treat awareness as an activity. It's alien to the way we use language.

But in the Buddha's language it isn't. He has a clear sense of the activity of minding, aware-ing, perceiving, and so on. So this is unfamiliar, but that very unfamiliarity may be advantageous. It may get you to notice something that otherwise you wouldn't notice. But again, it's just a game. Play with it, see what happens. If you don't like the game, you never have to play it again.

Remember, you're not meditating and you're not making any effort. Just play.

Okay, how did it go? What happened? And in particular, was there any effort involved? That would be a good place to start.

One participant shared: "To bring myself back when I got off..." So there was something, there was an activity. You had to do something. "I had to choose to."

Thank you. So there was a state of drift and then you made a choice? "Yes, and I guess because I'd gone out with the decision to do that, the choice, the kind of activity wasn't such a heavy thing, like 'okay, I'm going to choose.' It was more like 'oh.'"

So that was almost like when you're driving and you just go, "oh, I have to change gears." It wasn't really heavy or difficult, but it was something that had to be done. You just kind of do it—well, not quite automatically. You just do it.

Anyone else? How was it?

"I find as soon as that word 'aware' comes in, it's automatically in the body. It seems to have been patented, or maybe that's just the way it is. That 'aware' means, oh, what's happening in the body? And it will go to a specific place where there's stress or tension, if there is, or contact with something. So the mind seems pretty much conditioned that the first thing to be aware of is body."

I have the same sort of experience when I play this game. It's very physical. And it is interesting that the first satipaṭṭhāna is mindfulness of body—that the Buddha puts that at the center of the whole enterprise. To the point where... well, I like to say that meditation is not a spiritual activity. It's a physical activity. Because we do it with the body. And we do it not just with the body, but we do it *as* body.

"The other thing I noticed in retreat conditions is that it happens so frequently that I can't take it for granted."

So the difference in a retreat is that you're undertaking the project of noticing it. In my ordinary life, I'm busy doing something, so all my interest and concern is thrown into the something, and I tend to neglect the awaring of it. But in the retreat, we're interested in the awaring. What exactly happens isn't so important. We're creating a very boring environment, so it's the awaring itself which becomes interesting.

"For people that have ADHD, awareness is a very active thing. It's been called one of the advantages of having ADHD. I think that a lot of it depends on the kind of personality you have and how you experience it."

Yes, that's true. We each bring our own particular personality to the meditation practice, and that personality shapes the whole enterprise. And it's one of the dangers of a meditation technique which purports to be universal—"you must follow these instruc-

tions." But often that doesn't work because of the individual nature of the personality. The effect of those instructions can be radically different for two different people. So you really pay attention to, in this case, your particular relationship to awareness.

And that relationship sounds like it's quite active. So presumably you would be very careful about not adding too much activity.

Whereas somebody else might be really working on actively aware-ing. But it may be that for you, that's the last thing you want to do. You just want to step back and notice that activity is already going on and not add anything extra to it.

"I think I'm along the same lines. Every time I said the word 'aware,' I saw everything—things that I hadn't noticed at the beginning. So of course, you can't be aware all the time. Too much energy. Also, ADHD. And then I started getting anxious. I noticed my foot moving, and as I recognized that as anxiety, it moved faster. A very confusing, weird moment."

So it's like you're riding a high-energy horse, and the last thing you want to do is say, "Giddy up." But again, you're getting a sense of your relationship with awareness—how that relationship can work for you, how it can be effective for you. And how, if the meditation teacher emphasizes making more effort, you simply don't.

"Does that change when you're doing a meditation practice?"

No.

"But do the places where you stop change? Or is there a continuity between everyday awareness and meditation awareness?"

"Yeah, there is. It's recognizing that I'm no longer focusing on my breath, and then going back to it."

We shall explore that whole issue as we go through the retreat. It's a very interesting one.

"I thought it was a really pleasant exercise. It was nice not to use choice in the awareness. I just noticed where the awareness was. I didn't notice when I'd lost awareness, but I noticed the discontinuity of awareness and just enjoyed not forcing awareness on a particular object."

So it sounds like you enjoyed in particular not getting caught up in effort, not getting caught up in trying to do something.

"But it did involve remembering the awareness."

And did remembering the awareness feel active?

"It didn't. It just happens. But it was accompanied by a thought of, 'Where did that drop off? I didn't notice.'"

So the forgetting of awareness happened naturally, and the remembering of it happened naturally. And of course, the remembering of awareness is mindfulness, which we'll talk more about as we go through.

Let's play the game one more time, but we're going to change it slightly to get a different flavor—which I think you've already dabbled with, unless I misunderstood. Instead of saying "aware," we're going to name what we're aware of. As we've talked about, if I'm aware, I'm aware of something. One way of saying this is that awareness presents in the structure of a dyad: awareness and its object.

Awareness of X. And that's built in. If there's awareness, there's an object of awareness. If there's an object of awareness, there's awareness. It's always locked in.

Usually in our everyday life, what we're concerned with, what we're interested in, is the object. And we don't pay attention to the awareness itself. Whereas in this first game, we were persuading ourselves to get interested in the awareness itself. Now we're going to shift the focus to the other end of the dyad, to see the kind of awareness that we're doing.

For example, let's work with which of the six senses we're aware of: seeing, hearing, smelling, tasting, touching, minding. Minding includes thinking—most obviously it's thinking, but basically anything that's happening in the mind.

"In that exercise we just did, I found myself moving from noticing the sensations in my body, to seeing all the greenery, to hearing the rain. It bounced between all of those things. And then there was a thought, and I was lost in the thought for a minute, then I chose to come back. It just kept bouncing. But it was really nice, relatively relaxing."

"Yeah, it was lovely."

So this time, all that's different is instead of saying "aware," you just notice what it is. Seeing. Hearing. Touch. You just drop in what general kind of object is presenting itself to you at the moment. Does that make sense?

One would expect to be bouncing around. That would be perfectly normal. But every now and again, you just check: where is it now? Oh, that's where it is. Where's the awareness now? Oh, that's where it is. And again, you're not trying to make it go anywhere. You're not expecting it to behave in a certain way. You're just checking in. Oh, there you are. Oh, you're over here now. Oh, there you are. That's it.

"One of the reasons I like walking meditation is that if you lose your focus, you're very likely to stumble. And if you escalate from that to running a power tool, losing a finger—that's not paying attention."

Yeah, absolutely. You could say it's a basic human safety mechanism. We monitor what we're doing.

One thing I find interesting when I'm doing intensive meditation practice—well, one of the instructions I give at the beginning of a retreat, probably this afternoon, is: be graceful. As a meditation instruction, what this means in practice is be committed to noticing when you're clumsy. So if I stumble into something, trip over something, make a loud noise doing something—just pause. Oh, that's interesting. And check: what happened just then?

For me, usually it's because the awareness slipped away from the body into the mind, and I didn't notice it do so. That's when I stumbled.

Anyway, at this point we played another game. We actually did longer than five minutes, but the same principle: play, no effort.

Don't make effort. Don't meditate. Just drop it. Remember to simply drop in the word —seeing or hearing or smelling or tasting or touching or minding. And if minding is too abstract, thinking.

So how did it go? Is there a difference between dropping in the word "aware" versus dropping in where the awareness is going?

"Yes, definitely. I think we're more conditioned to focus on an object."

So it's easier?

"Yes, a lot easier because you're aware of an object, aware of a sensation, aware of a thought. It's just more what we're accustomed to doing. So that was almost natural."

Much more habitual, therefore easier.

"Still very fleeting. Because if you're aware, the next moment you have no idea what's happening."

One teacher uses the expression "to switch the awareness light on." It's like this image of stepping into a dark room and switching the light on. The problem is, the light then goes off by itself. So you switch it on again, but then it goes off. So you switch it on again. And what he points out is that it's not the meditator's business how long the light stays on. That's irrelevant. Just remember to switch it on. And that builds the habit. Don't be preoccupied by thinking, "Oh my God, it doesn't last very long."

"Well, that's the hard bit, because the controlling part wants to say, 'I need to be aware of that.'"

Yes.

"It's just not happening."

Yes. And that's where we get tangled up in too much effort and too much conceptualizing.

Anyone else? How did you find this second one?

"I agree it was easier to note the sensations and the different doors. I was aware that it was a multiple factor. There would be a strong physical sensation, and being with it, and then a bird would call. And the sensation in the body was still strong enough that I could feel it, be with it. And then going off to the bird, it was almost like they were intermingling a little bit, layering on top of each other. It happened also with any sounds that were happening, bodily sensations, and then visually, I would open my eyes and then the bird would call. So it was all coming together."

Yes. And was it coming together as the body or in the body?

"It was hard to stay with just noting 'sensation' because it would come up either as hardness or tingling or pressure or pain, rather than just a more neutral sensation. So it would move from one aspect to another, to another, to another."

Very quickly?

"Well, with regard to the sensation, it would stay. But to just say 'sensation,' it couldn't land there. It was more identifying what the sensation was."

Yes. And of course in this exercise, you don't have to.

You're just aware of it. We're keeping it very, quite deliberately, very simple.

"I was wondering if I was getting too involved," you might say. But actually, it sounds like the mind wanted to get involved, and you were being dragged along for the ride. In which case, you could have named it "involved" or "tangled." What's important is that you're opening up to seeing what the mind is doing. It can do whatever it likes, but awareness asks: well, what is it doing?

To sum up what we've been doing this morning: first of all, we've been emphasizing that awareness is part of nature. It's already here. It is already happening. It's just a matter of remembering it. And the remembering—that's the central bit the Buddha emphasizes. This is what in English is called mindfulness: remembering the awareness.

So the whole issue of effort becomes very interesting. How much effort do I have to make? What role does effort actually play? Do I have to make an effort to be aware? If so, what kind? What is it exactly?

When you take up the meditation practice, don't take up a heavy burden, something you've got to do. Rather, take it up lightly and play with it as a game. See what happens. How does it work? What does the mind do? Where does it go? There's more interest, more curiosity than effort.

Notice that awareness presents in the structure of a dyad: awareness and its object. If we name "aware," we're pointing towards awareness itself. If we name seeing, touching, and so forth, we're pointing towards the object. Either one includes the other. If there's one, the other has turned up for the dance. But our habit tends to be preoccupation with the object—that's usually the most obvious aspect for us.

So play around with awareness. Your mission, should you choose to accept, is to remember awareness. And do not take it seriously. Don't make an effort to be aware. Don't try to be aware. Just remember to play the game and be interested in the result.

That's enough for this morning. This afternoon we'll have a look at mindfulness itself, and then in the evening we'll talk more about the actual meditation method that Mahasi presents. We're taking it step by step.

If you feel the need, go and rest. If you've got the energy, go for it. Do whatever practice you find appropriate. But just be interested in awareness itself. Perhaps remember to drop in those little reminders: aware, seeing, thinking—whatever.

This is part of the process of settling in, settling down, and becoming familiar with awareness. We've entered a realm in which what we are doing is not all that important. What's central is the awaring.

So start to get interested in the awaring itself.

Any final questions or comments?

Good luck.

CHAPTER 32

On Mindfulness (Workshop)

Patrick Kearney · 42 min

> *In this foundational workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney offers a precise exploration of what the Buddha actually meant by mindfulness (sati). Drawing on the etymology of sati from the Pāli verb sarati (to remember), Patrick distinguishes between awareness—which is natural and always present—and mindfulness, which is the remembering of that awareness. Through simple experiential exercises like feeling the touch of one's hands, he demonstrates how awareness is inherently discontinuous, constantly being forgotten as we fall into habitual patterns and autopilot.*
>
> *Patrick references Susan Blackmore's consciousness research and her two key questions: 'Am I aware now?' (always yes) and 'Was I aware before?' (often no)—illustrating how we can be aware moment to moment yet forget that awareness instantly. He explains that Satipaṭṭhāna practice is not about restricting awareness to one object, but about tracking where awareness moves and remembering it continuously. The four Satipaṭṭhānas—body, feeling, mind, and dhamma—represent the entirety of human experience as potential meditation objects.*
>
> *The talk addresses the crucial question of effort (sammā vāyāma), drawing on Sayadaw U Tejaniya's teaching: 'Don't try to do anything. Don't try to prevent anything. But don't forget what is happening.' Patrick emphasizes that striving creates tension that obscures the fundamental fact that we are already aware. He recommends grounding practice in bodily awareness, particularly touch sensations, because physical experience is always present-moment and unmistakably clear—like 'an iron hammer hitting an anvil' compared to the subtler sense doors.*

This morning we were talking about awareness and getting a sense of what we mean by that. We spoke about it as the presence of whatever is present. Something is happening, and awareness is found in the fact that something is happening. Awareness is always linked to its object. If there's awareness, there's an object of awareness. If I'm thinking, I'm thinking something. If I'm seeing, I'm seeing something, and so on. Awareness comes to us through the six senses, which are six sensitivities: seeing, hearing, smelling, tasting, touching, minding. Awareness is the sense of presence, of something being present. If there is an experience, there is awareness. It's built in.

We talked about how awareness is just part of nature. We don't have to do anything to be aware. We are already aware. Which means we don't have to try to be aware. We are already aware.

So we played with the awareness game. There are different exercises that we can do to get a sense of awareness. The one that I've been doing for some time is this: Hold your hands together. Question: Can you feel your hands? Answer: Yes. Awareness. Question: Are you making any particular effort to feel your hands? Answer: No. Because it's just feeling the hands. That's it.

This brings in the whole question of effort that we talked about. U Tejaniya said that effort involved, for example, knowing that I'm touching my hands or knowing that I'm sitting is all the effort that I ever have to make in meditation practice, which is quite a radical thing to say. That's what he said.

So, we are already aware, but the question is, are we mindful? This brings us to this whole issue of mindfulness. The practice that we're doing, the Buddha calls satipaṭṭhāna, which can be translated as the establishing of mindfulness or the domains of mindfulness. You get different translations. It's the style of meditation practice that puts mindfulness right at the center. That's the key quality that we cultivate in this practice. So the question is, what does the Buddha mean by mindfulness?

Now mindfulness has become very fashionable, very popular, commercialized, corporatized, very much part of contemporary culture. But the way in which contemporary mindfulness is spoken of is not necessarily the same way that the Buddha himself speaks about mindfulness. What we're interested in doing this month is exploring the Buddha's understanding of mindfulness.

To get a sense of that we're going to do another meditation experiment, although this one is actually a genuine dead-set meditation experiment. We're not just going to wander about and be vaguely aware. We've got to start meditating now. What we're going to do is that exercise we were just speaking about. The meditation object is the touch of your hands. You sit and hold your hands, and that touch is your meditation object.

If you can settle into your meditation posture, sit comfortably, close your eyes, and ask yourself, holding your hands together: Can I feel my hands?

This is not a difficult esoteric meditation exercise that I might fail if I don't work hard enough. I'm just feeling my hands. And this experience of feeling my hands is awareness—the awareness of feeling my hands.

So keep feeling your hands. Is your awareness of your hands continuous? Or do you notice any breaks in your awareness of your hands? Is your awareness of your hands discontinuous? For example, you may notice thinking in the background of your mind and then suddenly realize thinking has taken over.

Did you lose the touch of your hand? Just feel your hands. Check to see if there are any gaps in your awareness of your hands. Are there any gaps? Or is your awareness of the touch of your hands continuous, with no break?

So was the awareness continuous or discontinuous? Discontinuous. That's a bit disappointing. Though I noticed during this exercise it's probably more continuous than it's been before.

This exercise actually originally came out of a book I read a few years ago called *Ten Zen Questions* by Susan Blackmore. She's an English researcher in consciousness and a Zen practitioner. The book has since come out with a second edition with a different title. She experimented with her Zen practice because in Zen sometimes you might use a question as your meditation object. So she invented ten koans, ten questions that she investigated sequentially.

I found the first two particularly interesting. The first question she investigated—and she would spend weeks meditating, trying to penetrate this—was: Am I aware now? After extensive practice, she came to the conclusion that the answer to that question in every single instance is yes. One hundred percent. The second question she worked with was: Was I aware before? And she said the weird thing was that the answer to that question was often no.

So how could the answer to the question "Am I aware now?" always be yes, but the answer to the question "Was I aware just then?" sometimes no? I forget exactly what she said about it, but what struck me was that she was pointing out the difference between awareness and mindfulness.

Awareness is natural; it's part of nature. It's already happening. But we easily forget it. We forget our awareness. The English word "mindfulness" is the translation of the Pali word *sati*, which comes from the verb *sarati*, to remember. So *sati* is actually memory. We won't be talking about mindfulness as far as the Buddha is concerned. What we're talking about is memory—but memory of the present, not of the past. This is what makes it different.

And of course, in railway stations you can see signs that urge the practice of mindfulness. You see those signs that say "Mind the gap." That's using mindfulness in exactly the way that the Buddha uses it. There's a gap between the train and the platform. Mind

the gap. Remember that there's a gap between the train and the platform. But it's not something that one remembers hours after the journey is over. The sign is asking us to remember it in the very act of stepping into or out of the train. In other words, it's asking us to remember the present. And the fact is, we often forget it.

The classic example I like to give is this: if you've ever been in a situation where you're driving down familiar streets and you realize you have no memory of the previous three blocks, you kind of wake up with "Oh my god, what's going on?" and start looking around. Now, if you think about that experience, if you ask yourself the question "During those three blocks, was I aware?"—my opinion is the answer would have to be yes. Because if it was no, I'd be dead. But if I ask the question "Was I mindful?" the answer is no, I was not. Because I forgot my awareness. And this, of course, is the experience of distraction.

So doing something like feeling your hands is easy. It doesn't require any particular effort. But doing something like feeling your hands for three minutes or five minutes—that turns into a job.

Awareness tends to be discontinuous. It moves. It seems to be broken up into fragments rather than being a single whole. And if we ask ourselves, when awareness moves, where does it move to? The answer in most cases is wherever habit takes it. Each of us has built up certain habits, certain long-term patterns of mind that simply take over if we're not doing something particular that we need to pay attention to. You could say that we fall into autopilot. And when this happens, we forget our awareness and we are prisoners of our past conditioning, because these habits are all expressions of past conditioning. This is the normal everyday experience of distraction when we meditate.

Mindfulness is characterized by a felt continuity of awareness. How do I know I'm being mindful? I know I'm being mindful if the awareness is continuous. And I put in that word "felt" because it's a discrete experience, a definite experience. Those of you who are experienced meditators, you know it. You know what it feels like. After some days of a retreat, you start to get into a groove and the awareness becomes continuous. It has a distinct flavor to it. This is the flavor of mindfulness.

So if we're developing a practice which centers on mindfulness, what we're interested in is remembering awareness. And this remembering actually has two flavors. Remember, we talked about how awareness always operates as a dyad—there's awareness of something. Awareness and its object. Sometimes mindfulness remembers the awareness, and sometimes mindfulness remembers the object.

For example, if you've had the experience of meditating, minding your own business, you slide off into thinking without knowing that you slid off into thinking, and then suddenly you realize, "Whoops, I'm thinking. I'm supposed to be meditating." Have you ever had that experience? Pretty common. At that point, you remember. What do you remember? You remember your awareness. "Well, that's right, I'm thinking. What am I doing thinking?"

But have you had the experience where the awareness slides off, you're lost in thinking, suddenly you know that there's thinking there, and the awareness goes bang, straight back to the meditation object? There you're remembering the object of awareness. So this remembering can have two aspects: I remember awareness itself, or I remember the object of awareness. These are the two flavors, as it were, of mindfulness.

So mindfulness remembers awareness, and it presents as the continuity of awareness. Awareness moves. And in this style of practice, we are not trying to prevent it from moving. Now, there are some meditation styles which do exactly that—styles that are more concentration or serenity oriented. If you're given the job to just focus on this particular meditation object and nothing else, what you're trying to do is stop awareness from moving. You're trying to keep it in one place.

But in Satipaṭṭhāna, that's not what we're trying to do. We're not trying to prevent awareness from moving. What we're doing is tracking how it moves and where it moves. We're following to see where it goes. And this is really important, because one thing that characterizes Satipaṭṭhāna as a style of meditation practice is that it is not restricted to any one particular object. It's not object-specific.

In the Satipaṭṭhāna Sutta, the Buddha talks about four Satipaṭṭhānas: body, feeling, mind, dharma. And basically this is technical code for everything. Every aspect of body and mind becomes a meditation object in this practice. This is what it's designed to do. It's not about restricting awareness, keeping it in one place. It's about tracking awareness, remembering awareness.

So if we ask in this practice, what is my meditation object in Satipaṭṭhāna? What is my meditation object in mindfulness meditation? The short answer is everything. Every aspect of human experience is a meditation object.

So it does not matter what the object of awareness is in this practice. That really, genuinely does not matter. What matters is that we remember our awareness. It does not matter what we are aware of—what matters is that we are aware.

Practice cannot be restricted to any one particular experience. And one of the implications of that is it cannot be restricted to any one particular technique, because there's no one technique which covers the entirety of human experience. So there's an element of creativity in this style of practice which is inescapable. We'll be talking about that later on.

A participant asks: "This morning you mentioned that you're using the term awareness as synonymous with consciousness. In the example of being aware of a sensory sensation and then starting to think and remembering—are you saying that in the process of thinking, maybe daydreaming or planning or something that isn't desirable, the awareness is not there when you go into thinking? Because you said that awareness is always there. So where is awareness when we're thinking or forgetting?"

What happens to awareness when you forget? Is it still there? Is it not there? It's a very interesting question to which I don't have a satisfactory answer.

There's a classical image: imagine you're on a beach near the water. You've got a stick and you draw a line in the sand, and the next wave comes up and obliterates it. You draw a line in the sand and the next wave comes up and obliterates it. This is an image of awareness without mindfulness. There's awareness, but we instantly forget it. It kind of flashes and it's gone. Flashes, gone. Flashes, gone. So we look back—was I awake? At the time, we were. But because it's weak, it doesn't last. It comes and then it disappears.

It's like when you're packing to go somewhere, like to a meditation center, and you're looking around the house and you think, "Oh yeah, that—I've definitely got to take that." In the meantime, your attention shifts. You saw it there and knew you had to pack it. Where is it? What happened? The awareness was there and then the eyes shifted and that awareness was forgotten. It was there but gone.

So awareness has depth. I can be very faintly aware of something and it's gone. I can be deeply, penetratingly aware of something and it stays—and can even be transformative. What we're doing in meditation practice is working with what's already available: awareness. But we're making it stronger. We're making it deeper. That makes a difference.

It's like waking up in the morning and knowing that you've been dreaming. You know it, but you couldn't say what you were dreaming about. You might have a vague sense of it, but it's forgotten. You were there, but then it's completely gone.

So in meditation practice, we're working with awareness.

We're making it stronger and deeper and clearer. Normal, everyday awareness can be very weak and very fleeting, but it's still there. Otherwise we couldn't function.

So as we've been playing around with awareness—am I aware? Yes, I'm aware. Am I making any particular effort? No, I'm not. So where does effort come in?

The effort comes in maintaining the felt sense of awareness over time. It comes in the commitment to remember. In other words, if we're going to do a meditation practice, we need to be engaged with it, with what's going on. There needs to be a certain sharpness of engagement rather than being completely dulled out.

It's like the fifth precept, the fifth way of training, which talks about refraining from the carelessness caused by intoxicants. If you come home from work stressed out and fling yourself in front of the TV, switch it on and just stare, the mind goes into drift mode. And that drift mode is a kind of intoxication. We don't really know what's going on. The mind is dull. It's being stimulated by the screen, by the sound, but nothing is really sticking. We enter into a kind of dull drift state of mind.

This is pretty much the opposite of what we're doing when we do a meditation practice. In a meditation practice, we're trying to be sharp and clear. This is what's going on now.

So we need this sharpness of engagement, but we also need to be relaxed. And this relaxation is quite important. If we're not relaxed, we are striving. And if we're striving, we become tense. And tension gets in the way of awareness.

One practitioner summed up the entire practice to his own satisfaction as "relax and be aware." Basically, that's it. Sometimes he would scold meditators: "Relax more!" Oh my God, I'm not relaxed enough—I've got to work harder! I'm not sure that admixture really worked.

Anyway, why is relaxation important? Because when we strive, we lose sight of the obvious fact that we are already aware. We don't have to try to be aware. We are already aware.

Now, if we're making too much effort in the meditation practice, what happens? We get lost in our concepts about the experience. We get lost in concepts about the meditation practice, and we lose touch with the actual experience.

Let's say we're doing something like staying with the touch of our hands—a simple exercise like that—and we notice that we tend to forget. We slide off and come back, slide off and come back. And let's say we make more effort to stay with the touch of the

hands. If we try too hard, then what happens is we get lost in concepts about what this meditation exercise is supposed to be. What I am supposed to be aware of. What this is supposed to feel like. What a meditation experience is supposed to be. We get lost in concepts of right and wrong, passing and failing, winning and losing. And all of these concepts distract me from the obvious fact that this is what's happening right now.

So this is a major problem with effort. The Buddha includes what he calls *sammā vāyāma* as one of the path factors. Classically translated as "right effort," I'm not sure that's really particularly accurate. It could be translated as right energy, right commitment. But the thing about that path factor—because it is called an effort—is that it is possible to make not enough effort.

In other words, for the mind just to go dull and not be engaged. And if there's not enough effort, it's not going to work. But it's equally possible to make too much effort, and if we make too much effort, we just tie ourselves up in knots and the whole process is slowed down. So it's about finding a balance, and it can be quite difficult to find that balance. We'll talk about it later in the retreat.

In the beginning of the retreat, I think it's important to learn to recognize and rest in the natural state of awareness. To recognize that I'm already aware—it's already happening—and to rest in that state. To learn to recognize awareness and not fight it. And in particular, not to fight ourselves.

We fight awareness when we try to make something happen. We have a view, an image of what should be happening, what is supposed to happen: I should be concentrated, I should be staying with my breath, I should not be thinking. We have this image, and this image defines the whole experience for us. We struggle to realize this view, to make it real, to make this image the felt reality. And this struggle creates tension and conflict. This very struggle hides from us the fundamental fact that we are already aware.

I like Sayadaw Tejaniya's description of right effort. It comes from his book, *When Awareness Becomes Natural*, and here he's quoting from his teacher, Shwe Oo Min Sayadaw. Tejaniya says: "Don't try to do anything. Don't try to prevent anything. But don't forget what is happening."

I think this pretty much sums it up. Don't try to do anything, to accomplish anything. Don't try to prevent anything. But don't forget what is happening.

We need commitment. When we allow habitual forgetfulness to take over, at that moment we have lost our commitment—not enough effort. But when we try to do something or try to prevent something, we make too much effort. We can find right ef-

fort when we are committed to reminding ourselves that right now, something is happening. So what is it? What's happening now? It's the commitment to remembering where we find the effort. But notice it's all focused on what's happening now—not focused on what I think should or should not be happening.

Does that make sense?

So in this practice, anything at all can be a meditation object. But for practical purposes, it can be very useful to have the body as the center of our focus, our anchor. Usually when we begin, we start with awareness of body. That's a very normal, everyday place to begin—being sensitive to physical experience. This means the five physical senses: seeing, hearing, smelling, tasting, touching.

One thing about this place is that the physical world is very in your face. Apparently this is summer, according to the locals anyway. It was summer in Brisbane, I can tell you that. But according to the weather reports, in a few days' time it'll be hot and dry.

And a day or two after that it could be cold and wet. This is the Blue Mountains. So there's a lot happening in the physical world, which is very good from a meditator's point of view, because it's obvious, it's clear.

The five physical senses are very important, but in particular, sensitivity to touch—the fifth of the five senses. This is very important because according to the later tradition (this is not the Buddha, this is the later tradition), in the Buddha's understanding of experience, experience is always an impact. There's a sensitivity, and there's something out there in the world that strikes that sensitivity.

So there's light and form, and there are two parts of my body, one here and one here, which are sensitive to light. Now this part of my body is not—my hand doesn't know whether it's night or day. But these two parts of my body are sensitive to light. Light streams in and strikes the body, touches the eye, and something happens. It strikes the sensitivity and something happens. These two parts of my body are sensitive to sound. Sound strikes that sensitivity, something happens. So there's an impact between sense object and sense sensitivity. Bang.

When that impact occurs—and this is what the Buddha calls *phassa*, usually translated as contact—something happens. According to the later tradition, when you're dealing with seeing, hearing, smelling, tasting, the impact of the object on the sensitivity is like cotton wool striking cotton wool. It's very soft. But the impact of a touch sensation striking the body is like an iron hammer hitting an anvil. It's very strong. It's very clear.

This makes touch very, very good as a meditation object. It's easy to find and easy to stick with. That's why you have things like breathing and body scan as meditation objects—they all involve touch. So in the beginning, be open to whatever is happening, but be particularly interested in the experience of touch. It's one of the reasons why we emphasize posture, because that opens up that whole field of touch.

The other thing about the physical world, especially clear in relation to touch, is that a physical experience is always in the present. Mind time travels. Mind can convince us that past is more real than present, or that future is more real than present. But body can't do that. Whatever the body feels, whatever it impacts, is always in the present.

Now, the job of this meditation practice is done in the present. We can't do it in the past, we can't do it in the future. If we're going to ground ourselves in the present, the most obvious way to do it is to ground ourselves in body. Again, in body, the most obvious is touch.

So if you're still settling in, basically just hold your awareness in your ordinary everyday activity. This is everyday mindfulness, where the meditation object is the normal flow of experience—wherever your awareness naturally goes, just track it. This is where the awareness is. But give priority to the body, because this helps to ground awareness in the present rather than allow us to drift off into past and future.

A few things to try. One is to feel your posture. Get a sense of what the body is doing now. How does the body occupy space now? What does the body feel like now, in a general sense? Feel your posture, and then ask yourself: what am I aware of now? It doesn't matter what we are aware of, but am I clear about what I am aware of? You might try the question: what is clear now? Or what is obvious now? Something is clear.

Something is obvious. What is it?

So becoming interested in what is happening now, rather than trying to make something happen. And remembering to drop in those questions. This is like switching on a light—we are switching on our awareness. And it doesn't matter how quickly the light goes off again. When you realise the light's gone off, just turn it on again. Switch it on again. Which means, switch it on now.

Tonight we'll talk about the actual meditation method taught by Mahāsī Sayādaw. So we're gradually getting into it. But just for today, perhaps in general, some basic tips.

Firstly, do not be in a hurry. Often the instruction is to slow down, and often that means really slow down. But don't try to slow down, because again, that's too much stress, too much concept getting in the way. Just don't be in a hurry. And notice when you find yourself hurrying, because you may find underneath the hurry is some tension. Feel the tension and relax. And how is your posture when you relax?

So don't be in a hurry. Be graceful. I think we've already mentioned this. Which in practice means be committed to noticing those moments when you realise you are clumsy. When you drop something, or bump into something, or trip over something, or make a loud noise doing something—be interested in those moments. You may notice that a moment of clumsiness is conditioned by a momentary loss of mindfulness, a moment when we lost awareness of the body and dropped into a habitual concept.

Don't be in a hurry. Be graceful. Recognise awareness. When you're meditating, do not try to be aware—just notice that you are already aware. Just switch on the light.

And finally, to help this whole process, every now and again you might drop in a question like: What is clear now? What is happening now? What is obvious now? And just see what it is.

Any questions? Is this all too basic for you? You're experienced meditators, you're thinking, "This is kindergarten playtime—when are we going to get stuck into it?" That's probably what you're thinking.

But meditation is really, really simple.

Now, some of you are not familiar with the great game of rugby league. This is a game in which big blokes get a footy, divide into two teams, and assault each other vigorously in an effort to get the ball across the line. Rugby league and meditation as activities have an enormous amount in common—very, very similar. Meditation, like rugby league, is a simple game with simple rules for simple people.

So don't make it complicated. Something is happening. What is it?

Thank you very much.

CHAPTER 33

On Method

Patrick Kearney · 47 min

> *In this foundational talk from a 28-day Satipaṭṭhāna retreat, Patrick Kearney offers a detailed exploration of the Mahāsī Sayādaw meditation method. Building on an earlier discussion of awareness as "the presence of that which is present," he introduces the practical framework that Mahāsī developed in mid-20th century Burma to make serious insight meditation accessible to lay practitioners—a radical democratization of practice previously reserved for monastic elites.*
>
> *Kearney presents the "three N's" central to this approach: noting (directed awareness actively reaching toward an object), noticing (receptive awareness receiving whatever arises), and naming (the optional practice of labeling experiences to sharpen accuracy). He explains how different practitioners naturally gravitate toward more directed or undirected styles, and how this preference often shifts with age and experience. The talk also clarifies the concept of the mūla ārammaṇa (grounding object)—traditionally the rising and falling of the abdomen, though Kearney emphasizes finding whatever grounds awareness most readily for each individual.*
>
> *Particularly valuable is his teaching on secondary objects: when the mind is "conscripted" by distraction, that very distraction becomes the meditation object, effectively dissolving the concept of distraction altogether. Over time, he explains, the distinction between grounding and secondary objects evaporates, leaving simply the flow of experience itself—whatever is happening now becomes the object. This progression from structured technique to natural awareness illustrates how method serves as scaffolding for beginners that gradually falls away as practice matures.*

So tonight we're talking about method, the meditation method that we're doing in this retreat. This morning we looked at awareness. We started with awareness, and we emphasized, first of all, the elemental simplicity of awareness. Awareness is the presence of that which is present. If something is present, well, that's awareness. That quality of presence is awareness.

We talked about noticing awareness. Normally—well, first of all, we said if there's awareness, there's something we are aware of, there's the object. Awareness and its object always come together as a partnership, as a dyad. Usually, we put all of our atten-

tion and concern on the object of awareness. We think that's what's important, and we tend to miss the aware-ing itself. But in meditation practice, the aware-ing itself, the experiencing itself, becomes significant.

In any event, we started with noticing awareness, and we can use questions to remind us of this: What am I aware of now? What is clear now? What is obvious now? What's happening now?

Then we looked at mindfulness, which is essentially awareness extended through time—awareness made continuous over a period of time. This is mindfulness.

Tonight we're moving on to the particular style of meditation practice that was developed by Mahasi Sayadaw. He lived from 1904 to 1982 and was part of a major revival of meditation, especially meditation for insight, vipassanā—meditation aimed at bringing the practitioner to some degree of awakening, and in particular, getting lay people involved in serious practice.

In 1945, Mahasi published a book called *Manual of Insight*—in Pali, *Vipassanā Dīpanī*. The English translation was only produced not long ago, certainly this century. For decades it wasn't available in English; now it is. If you want a difficult, technical, and complex read in which you enter into a medieval mindscape, it's a page turner.

That book made his reputation throughout Burma, and it earned him an invitation, I think around 1947, to move to Rangoon and become the head teacher of a new centre being developed by a group of people closely associated with the first government of independent Burma. This was part of the overall Burmese effort to revive Buddhism, to allow the whole nation, if not the whole world, to face the challenge of modernity. As part of this movement, in 1956 they held a Buddhist council and got together—mostly Burmese, though they invited people from overseas—to recite and edit the Buddhist texts. The emphasis on meditation was really important.

The motive, or part of it, was this: the Buddha teaches impermanence. Everything is impermanent, including Buddhism. In the Theravāda, the belief is that Buddhism will last 5,000 years. Under the traditional dating of the Buddha, the 2,500-year halfway point was reached in 1956. From 1956 onwards, it's guaranteed all the way down—which means there is not a moment to be lost. Don't stick around until the next life; it may not be available. This would be Mahasi's advice.

Somewhere in one of his books—most are sermons that have been transcribed—he was urging his audience in Burma to take up meditation practice. One of his arguments I found very interesting. He said, "Look, you're very lucky you've been born in Burma. You've been raised Buddhist, you're full of faith, and because you're faithful Buddhists

making merit, you're making so much merit that you are in serious danger. In your next life, you might end up being born in the USA. Once you're there, you're going to be comfortable, but are you going to have an opportunity to practice Dharma? Probably not. So do it now. Get enlightened now, and then be reborn in the US." I don't know how effective this argument actually was.

Traditionally, meditation practice—but especially serious meditation practice, designed to take the practitioner from here to awakening—was assumed to be the business of an elite of full-time professionals: a minority of monks and nuns, and a tiny, tiny minority of lay people.

What Mahasi and others in this reform movement were doing was creating, crafting an approach to meditation that any lay person of reasonable health and a goodly amount of dedication could learn—and which would take that person to awakening. This was a very radical project.

So let's get into the details. First of all, we start again with awareness, as we've talked about. Awareness is the presence of that which is present. Awareness is happening already. I don't have to make any effort to be aware—I'm already aware. It's already happening.

But when we look closely, we can see that awareness has depth. I can be faintly aware, like a dream that I forget within seconds of waking up. Or I could be very clearly and penetratingly aware, such that this event I will remember for decades to come. Or anywhere in between. There's a whole spectrum of the depth of awareness. This suggests that awareness can be developed, deepened, strengthened.

So how do I deepen awareness? How do I make it stronger? I do this by practicing attention. Attention—what the Buddha calls manasikāra—is the act of directing awareness. It could be compared to the difference between seeing and looking. I don't have to do anything to see. If my eyes are open, I see—maybe not very well, but I can see. But if I'm looking for someone or looking for something, then I'm doing something. I'm directing visual awareness in a particular direction or towards a particular object.

Attention is the act of directing awareness. And you notice that it is active. We could say that attention is awareness as a verb.

In English we tend to treat awareness only as a noun. But in the language of the Buddha, it's clearly also very closely connected to a verb. Awareness would be vijñāna, and this noun comes from the verb vijānāti—to aware. In one discourse, the Buddha is going through some key technical terms, and he plays with the sounds, plays with the words as he does this. In English, you might say something like, "Why do we say aware-

ness? We are aware, therefore we say awareness." But in Pali, it's, "Why do we say vijñāna? Vijānāti, therefore vijñāna." And in the Pali, you can see the very close connection between the verb and the noun. Why did we say perception? We perceive, so we say perception. Why do you say saññā? Sañjānāti, therefore saññā.

There's a very close connection in the language and in the way of conceiving how the world works between verbs and nouns in classical Indian languages that you don't necessarily get in English.

So attention is awareness as a verb. It necessarily involves some degree of engagement or effort. When we are aware, the tradition says, mind moves towards its object to engage with it. Awareness is active. It's more process than thing. More activity than thing.

This brings us to how we work with awareness in meditation practice. In the Mahasi lineage, we speak of three basic activities involved in awareing an object. These can be conveniently called, in English, the three N's: noting, noticing, and naming.

Now the first two are the most important—noting and noticing. These could also be called directed awareness and undirected awareness. Let's start with noting.

This is the word probably most associated with Mahasi's approach. Noting is directing awareness towards an object. You notice that it is essentially active in its nature—it's a reaching out. The mind reaches out to something in the world, either in the physical world or the psychological world. So we could call it directed awareness.

For example, let's say I'm going to meditate, and I've chosen breathing as my meditation object. I'm actively directing awareness to this breath, now. And then I'm actively directing awareness to this breath, now. And then again to this breath, now. I'm actively engaged, now. And again, now. And again, now. This is noting, or directed awareness.

The flip side is noticing, or undirected awareness. Noticing is awareness receiving an object. It's not active; it's receptive. I am awaring, but I'm not deliberately aiming at any specific object or in any specific direction.

For example, let's say I'm doing breathing meditation. I'm actively awaring the breath, but at the same time I can hear the sounds around me. Now I'm not interested in the sounds and I'm not actively listening to them because all my energy is taken up with the relationship with the breathing. But the sounds are coming to me. I am receiving the sounds. I am aware of them. To some degree I'm actively engaged with them, but it's very slight, and certainly I'm not deliberately directing awareness towards them instead of actively directing awareness towards the breathing.

So: directed awareness, undirected awareness. Noting, noticing. Active, receptive. In directed awareness we aim awareness at an object; in undirected awareness, the object of awareness comes to us.

These represent two ends of a spectrum. One end directed, the other undirected. Active, receptive. And these two ends of the spectrum point to different relationships that we can have to the meditation practice.

Some meditation styles emphasize directed awareness, so they're primarily concerned with focusing awareness on a specific object—breathing, for example. Other meditation styles emphasize undirected awareness, and they are primarily concerned with simply receiving whatever is coming through the senses.

Again, it's a spectrum, and you find different approaches to meditation plotted somewhere along it. It's unusual to find one at the very end; you usually get some kind of mixture. But in the Mahasi lineage, Sayadaw U Pandita, for example, was very much into the directed approach and really emphasized that. Sayadaw U Tejaniya emphasizes the undirected approach.

In terms of which one to do, it's very much up to the individual. It's not that one is right and the other wrong, or one is better and the other worse. A lot depends on the practitioner, on their particular sensitivities.

In my experience, most new practitioners—and most practitioners beginning a meditation retreat, at least in the early stages—prefer directed awareness because it quite literally gives them something to do. It gives them an object to ground awareness on. Whereas if they just do undirected awareness, they could very easily get lost and spend days mind-wandering in a vaguely spiritual, Buddhist-y way.

Other people find that when they engage with directed awareness, it creates strain and tension—strain in the mind and tension in the body. They much prefer the sense of ease they find in undirected awareness. They find that if they simply remember—which is mindfulness—if they simply remember to recognize that mind is already aware, along with what mind is already aware of, then that's enough.

The practice gains its own momentum—it can develop without any sense of having to do something special. It just rolls along in a very natural way.

So it's not that one approach is right and the other wrong. It's not that one is better and the other worse. But what you might find is that what suits your particular circumstances is one or the other. And that can change over time.

For example, in my experience, meditators who are getting older—let's say someone who started meditation when they were quite young, quite energetic, going through enlightenment and not mucking about—they can have a very directed, energetic, active, engaged relationship with the meditation practice. An approach like Sayadaw U Pandita's really appeals to them, and they can go a long way with it.

But the decades roll on. They start to get old. They start to lose the kind of energy they used to have. Sometimes the earliest signs of this appear in retreat. Someone will come to an interview and I'll ask, "How's it going?" "Oh, not so well this year." "Why not?" "I just can't really focus the way I used to focus. By this stage in the retreat, I should be sitting three hours. It doesn't seem to quite work."

What sometimes emerges is that with age they simply don't have the energy for directed awareness anymore—because directed awareness takes a lot of energy, and when you get old you lose energy, so you can't sustain it the same way. I've found that older meditators tend to naturally segue into a more undirected style of practice, partly because of the energy issue but also partly because, if you're an experienced meditator, it's as though you've explored a landscape through directed awareness over a long period of time. Basically the mind is saying, "Been there, done that. I don't need to do it again. So why are you trying to push me into it?"

Because so much has been learned, so much absorbed, there's no need to do, quote unquote, anything in particular. It'll just happen, given the chance, given the opportunity. So that can occur as well. Circumstances change, and the practice changes with them.

Some people find that this whole distinction between noting and noticing, directed and undirected, dissolves entirely. What emerges is simply awareness itself—awareness awareing, and that's it. Classifications like directed and undirected, noting and noticing, become meaningless. It's just: whatever arises, I'm aware of.

So although we're laying out Mahasi Sayadaw's basic approach, one isn't stuck in it. Any kind of meditation technique, essentially, is for beginners. It's to get us going, to give us a structure, to give us something to do, and to shape the whole enterprise. But as the practice develops, all of that drops away. We find our own way of doing things, and that way will naturally emerge.

So we have active and receptive, directed and undirected, noting and noticing. And finally we come to naming.

Now, the first two distinctions are built in, as it were—this is the way awareness works, the way the mind works. This third one is an optional added extra. It's not as central as the first two.

Naming places a concept, a name, or a label onto the object of awareness. Let's say I'm tracking the breathing—breathing is my meditation object. I can name it: "In... out... in... out." And then suddenly I realize I'm distracted by thinking. I can name that too: "Thinking... thinking."

And then come back.

Now, the purpose of the naming is to stimulate aim or accuracy. It's to remind me: that's where I'm sending the awareness. I'm sending it there, not here. There, in-breath, not the up-breath—in-breath. And now it's up-breath, not the in-breath—up-breath. Now it's a thought. Now it's the breath. So it's solidifying the whole thing, reminding me: this is where I'm aiming the awareness. And it helps develop accuracy and aim. We're going to play around with this tomorrow morning, so we'll talk about it then.

So this is naming. Again, naming is an optional added extra. Some meditators use it a lot. Some meditators never use it. Many meditators fall somewhere in between. The people I know, long-time meditators, have a whole range of different relationships to naming.

I don't use it very often. I use it in the beginning, often as questions, like "What's clear now?"—just to get me started, rev the engine up, as it were. And then it falls away. And it comes back if the experience changes and I'm in unfamiliar territory, so I'm not 100 percent sure what's going on. Then if I drop in a name, and if it's the right name—click, that's what it is. This is what's going on. And then once it's clarified, I can drop it again. So different people develop different relationships with naming.

So these are the three N's. Is that making sense? This is looking at Mahasi's approach to meditation practice in terms of what we do with the mind: direct awareness, receive, name.

But we can also look at meditation from the point of view of the meditation object—what we are aware of when we practice. So we've got the awaring and we've got the object of awareness. Noticing and naming are all about how the awaring is structured. But we can also look at how the object is structured.

Now, we've seen this morning how awareness tends to move. The mind tends to wander from one object to another, to another, to another. And especially, it's very easy for the mind to slide into habitual thinking. What we want to do is train attention so we can maintain a felt continuity of awareness over time. And the longer the time, the better.

Now, if we're going to do that, we need to learn how to stabilize the mind. And if we're going to do that, we need to be able to ground awareness. This grounding of awareness develops what the Buddha calls samādhi—classically translated as concentration, but perhaps more accurately, unification or integration.

So if awareness is awareness of something, if awareness always has its object, and if we want to stabilize the mind, we need to be able to settle awareness somewhere in such a way that the awareness is encouraged to rest and become still.

Mahasi Sayadaw spoke of this place as, in Pāli, the *mūla ārammaṇa*. Literally this means "root object"—*ārammaṇa* is object, *mūla* is root, like the root of a tree. Now, this root represents our foundation, our ground. So I translate *mūla ārammaṇa* as "grounding object," because this is where we ground our awareness. This is where awareness makes its home.

In standard translations of Mahasi's work, this is rendered as "primary object"—the prime, the first, the most important.

Normally, the mind chases after one thing, then another, then another, restlessly in search of a satisfaction that never quite arrives. But if we want to cultivate mindfulness and samadhi, we need to stabilize the mind, which in practical terms means we need to learn how to keep our awareness in one place over a period of time. This is the function of the grounding object. This is what it is for. This is its job: it gives us a place where our awareness can settle and stabilize over a period of time.

One way of looking at it is that our grounding object is where our awareness remains unless it has a specific reason to go somewhere else.

Probably the most common grounding object in the world of Buddhist meditation is breathing. Mahasi Sayadaw recommends placing awareness in the movements of the breathing sensed in the abdomen. When he first taught this, back in the 1940s, it was highly controversial. Burmese Buddhism is very orthodox Theravada Buddhism, and in Theravada Buddhism, if you say "breathing meditation," everybody knows that what you mean is keeping your awareness at the nasal passage—where the breath enters and leaves the body.

Anyone who has done Goenka retreats will know this approach. Burmese Buddhism is, to put it not so politely, a touch fanatical—very orderly, very organized. You do three days of anapanasati, mindfulness of in-and-out breathing, which means you keep your awareness here at the nose, nowhere else.

So in Theravada Buddhism, if a practitioner says "I do breathing meditation," what they're telling you is that when they meditate, they keep awareness at the nasal passage. The Buddha himself never mentions this specific location—it's not in the suttas at all. It first appears in the Patisambhidamagga, which is an explicitly Theravada text and the first path manual in the Theravada Buddhist tradition. A path manual is a book that tells you how to get from here to enlightenment. The Patisambhidamagga is very early—so early that the book itself is classified as part of the Sutta Pitaka, though it was developed after the Buddha's lifetime. But this is where they established: breathing meditation means awareness at the nose. And from there on, Theravada followed this instruction.

Then Mahasi comes along and says: follow the rising and falling of the abdomen. He caught a great deal of criticism, both in Burma and elsewhere.

So why did he do it? Why open himself up to such criticism? It seems he was approaching this problem of the grounding object with fresh eyes. We need something clear, obvious, and available. He felt that the breathing sensed in the abdomen fulfilled these criteria—that most people, most of the time, would find these movements clear, obvious, and relatively easy to follow. So he was prepared to accept considerable criticism.

He called these movements the rising and the falling of the abdomen. He said it's as if, when you breathe in, the abdomen rises; when you breathe out, it falls. You can note it as "rising, falling, rising, falling." Mahasi's approach became famous for this.

But notice what it's for. He recommends it for the very pragmatic reason that in his experience, this is where most people can most readily ground their awareness during sitting meditation.

The fact is, however, that no single technique actually works for everybody. Mahasi's approach was developed by a mid-twentieth century Burmese teacher for mid-twentieth century Burmese practitioners. In my experience in twenty-first century Australia, many meditators have difficulty finding the rising and falling of the abdomen. For them, it is not obvious at all, and they struggle with it. Then they're told, "Look, what

you've got to do is follow the instructions of our great teacher Mahasi Sayadaw. He says note rising and falling of the abdomen. Just do it." And they struggle to find it and hold on to it.

But this completely defeats the purpose of the grounding object. The grounding object is meant to be something clear, available, easy to find. The reality is that rising and falling of the abdomen is not necessarily a good grounding object for everybody.

It certainly is not a good grounding object for everybody.

Another reason, by the way, why I think Mahasi liked or used this is because you're keeping awareness inside the sentient body, which means you're keeping the awareness inside the emotional body. I think this is one of the reasons why he chose this. If you do meditate here at the nostril, and if you succeed with it, it can catapult you into a deep concentration state which is entirely disembodied. But for insight meditation, you want to be embodied. You do it in the body. So following the breathing inside the body makes a lot of sense.

It's important that we return to basic principles. We want to ground our awareness. The easiest way to do this is through some aspect of body or mind which we can easily find and then stabilize our awareness on. It also helps if this object of awareness is itself stable—either relatively still, or if it is moving, moving rhythmically.

So it could be the breathing. But where? When you sit, you can ask yourself the question: Am I breathing? You probably are. And then you might ask yourself: How do I know? What's the experience that tells me this is breathing? And you may find movement in the abdomen. You may find movement in the midriff. You may find movement in the chest. You may find movement further up. But basically you go for where it's clearest and most obvious, because that's where you can ground the awareness.

Other things could serve as the grounding object, like the touch sensations of the body where the body is pressed against the cushion, the bench, the chair. It could be posture. The posture itself is a very good grounding object—the Buddha himself mentions it in the Satipaṭṭhāna Sutta. It could be the breathing, it could be something else. For most people it will be something physical, not in the mind. But again, there are some unusual meditators out there, and for some people mind is actually the best grounding object.

This is what we need to establish as we develop our own practice: Where can I most readily rest my awareness so it will remain relatively still over time? This is my grounding object. This is what my awareness will learn to call home. And you will find, over a meditation career, that this will change. So the grounding object is not so much a specific part of the anatomy—it's a function. The function of where can I stabilize awareness.

So, grounding object. We're stabilizing awareness, we're stabilizing the mind, but the fact is, mind moves. And so every practitioner discovers that restlessness is one of the most obvious characteristics of the mind. I'm thinking, and then I'm looking, and then I'm wanting, and then I'm moving, and so on and so forth.

Now, this realization of how restless the mind is, and how little control we have over these movements—often it comes as a shock to the new meditator. One of the classic complaints of the new meditator is they're doing, say, their first retreat. And after some days in the interview, I'll say, "How's it going?" They say, "Oh, it's awful. It's going really badly." I say, "Why? What's happening?" And the person will say something like, "Look, when I came here to do this retreat, I knew that I think a lot. I mean, that's one of the reasons why I came here, to get away from it. Now I'm thinking ten times more. So it ain't working."

And in all probability, they're not actually thinking ten times more. They're just ten times more sensitive to what the mind is doing. That's usually the story.

So it comes as a shock to recognize how little control we have over our minds.

That's fine, because it's important to realize that if we're cultivating mindfulness, we're not trying to stop our minds from moving. We're learning to understand that the mind moves and to understand how the mind moves. And we can't do that if the mind doesn't move—we can only do it if it moves. Recognizing and understanding these movements is the gateway into insight.

There are some meditators, very unfortunate ones, who will come into the hall after breakfast, check the time, note that lunch is in three hours, and just sit there in deep samādhi for three hours without the slightest movement in the mind. Then, at precisely the right time, they emerge from samādhi, shake off the bliss, and go to lunch. I mean, how appalling is that? Because what have they actually learned about the nature of mind over those three hours? Pretty much nothing. If we want insight, it's about movement. It's about what the Buddha calls the perception of impermanence. So the fact that the mind moves is not a problem—it's the content of the practice.

This brings us to what we call the secondary object. The grounding object is our home base, where we train our mind to stabilize. But the mind is extremely difficult to stabilize, and it dashes off to visit different places. These different places are our secondary objects, and usually they are revealed by our distractions. We're minding our own business, meditating away, and then suddenly we find we're caught up in thinking or physical pain or something of this nature. We recognize that we were brought there to this new experience by force. We were conscripted. We had no choice in it—we were just dragged there. But once we realize that we've arrived, then we volunteer for the experience and we note the distraction. We're directly aware of the distraction, and the distraction becomes our meditation object.

I think this is probably the central characteristic of Mahasi Sayadaw's approach to meditation practice. As soon as our mind rebels and we realize that our awareness has been taken somewhere else, that we have been distracted, quote unquote, that new object of awareness becomes the meditation object—which means that distraction disappears. Because what we previously used to call distraction simply becomes a secondary object. So we note, we actively aware the secondary object, and then we come back to the grounding object. And again we're distracted. As soon as we know we're distracted—so what is it? What's going on?—we actively aware the experience, and then we come back. And then we're grabbed again. We actively aware the experience, and then we come back. So we're moving from grounding to secondary to grounding to secondary to grounding to secondary. And these movements reveal the habitual journeys that our mind undertakes, journeys that normally we don't really notice.

Now the question always comes up: how long do we stay with our secondary object? In the early stages of the practice, the answer to that question would be not long at all, because we need to stabilize the mind. In the early stages, this is the major job. So we acknowledge the distraction, we note it, we are actively aware of it, but not for very long, and then we come back. Basically, we favor the grounding object. We give it preference. And that relationship with the grounding object is what builds the samādhi over a period of time.

Now sometimes our secondary object will not let us go—for example, pain, physical pain, or obsessive thinking. If that's the case, we stay with the secondary object longer. How we stay with the secondary object—that is a question of skill. That's the craft of the meditation: how to do it, how to work with this particular object.

And this is what we'll be exploring during this retreat. We'll talk more about it as we go through.

Over time, the practice develops. It matures. And the method that Mahasi lays down is for beginners. So over time, the distinction between grounding object and secondary object evaporates, and the meditation object simply becomes the flow of experience itself. Conceptual distinctions between grounding and secondary object cease to be relevant. All we've got is the flow of experience.

In one place, Mahasi says the meditator's job is to note, to be actively aware or directly aware of whatever arises in any of the six senses as it arises. No primary, no grounding object, no secondary object. If it's happening now, it's the object. But this is something that naturally develops over a period of time. Sometimes people make the mistake of hanging on to that initial structure for too long. But basically, at some point, you start to let it go and realize: what is my meditation object? It's whatever is happening now. That's the meditation object.

I think that's pretty much it. Any questions?

Someone shared a story: "I needed a tool from the tool room once. I knew it was in a green box, and I went in looking for it. There was attention, but I couldn't find it. I looked again with directed attention, but still couldn't find it. The third time, I decided maybe it's not in a green box—and I found it, by the way."

I don't quite understand it, but it sounds very profound! You can miss things very easily because that quality of directing—where is it coming from? It's coming from a mind that has certain expectations.

How do you work with that? If you don't know whether you had an expectation—well, did you? Perhaps it wasn't a very strong one. But that kind of experience illustrates the importance of not taking anything for granted. I think this is one of the great challenges of meditation practice. We tend to take experience for granted. We tend to assume we know what's going on, or we assume we know what will happen. And that blinds us to what's actually occurring.

Sometimes you can see this attitude emerge in experienced meditators who say, "Oh yes, well, today's day three, so such and such will happen. Today's day four, then this will happen." They've already written the script. But how do they know?

This willingness to be—what I would call it is the willingness to be taken by surprise—is important in this practice. For me, it's part of the creativity of the practice. You don't get locked into a technique. There's that degree of creativity always involved in it, which I think your little story illustrates.

Another question: "What's the role, if any, of visual overlay—maybe imagination—onto direct sensation? You're directly sensing something, but on top of that there's a visual overlay. Does that develop as the practice develops? Does it get stronger?"

I'm not sure. For some people it does. What appears to happen is that as the mind becomes stronger and clearer, the conceptual world that it throws up becomes ever more vivid, more real.

So you can, one form that this takes is that people—not so much in Australia, but certainly in Asia—will talk about having visions. In Thailand, for example, it used to be quite common for meditators doing this style of practice, after some days of sitting, to freak out because they start to see ghosts. In different cultures, people have different kinds of visionary experiences. Sometimes it's clear that it's not something external appearing, but rather that the visual world is suddenly thrown up by the mind, quite clear and strong.

So these sorts of things happen. The mind will play, you could say, all sorts of tricks as it gets clearer and stronger. And the response is always the same. You just note it. Seeing, for example. The visual overlay—that's just seeing. But you're seeing with the mind rather than with the eyes. It's just another experience. But it's probably an indication that the samādhi is getting stronger.

CHAPTER 34

Tracking the Elements (Workshop)

Patrick Kearney · 53 min

> *In this experiential workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney introduces the practice of tracking the four great elements (mahābhūta) as part of mindfulness of body (kāyānupassanā). He emphasizes that the Buddha's teaching is fundamentally a first-person discourse concerned with direct experience rather than objective scientific explanation—we're not learning geography or cosmology, but investigating experience as it actually unfolds.*
>
> *Kearney explains that body in Buddhist practice means our direct experience of physical sensation, not our concepts about the body. When sustained awareness is applied to what we assume is solid and unified—like a hand or painful knee—it breaks apart into discrete elemental qualities: earth element (hardness/softness), fire element (heat/cold), water element (wetness/dryness, stickiness/slipperiness), and air element (movement/stillness). These elements survive sustained awareness; our concepts do not.*
>
> *The workshop includes guided meditation exploring each element, followed by discussion about individual sensitivities and practical application. Kearney connects this precision practice to vipassanā—literally 'seeing separately'—explaining how breaking apart seemingly solid experiences into their component processes is essential for insight. When we examine pain closely, for instance, we find not one thing but a collection of sensations and psychological responses. This analytical capacity, balanced with periods of open awareness, develops the mental clarity and malleability needed for deeper practice.*

This morning we're going to play around with tracking the elements. This is part of the first Satipaṭṭhāna, mindfulness of body, and the role of the body is extremely important in this practice. I'd like to say that this is not a spiritual practice—it's a physical practice, because it's done within the body. In fact, I can't think of any Pali word which would actually translate as "spiritual." I think it's an alien concept for the Buddha.

When we start talking about this, we're reminded that the Buddha's Dharma, his teaching, is a first-person discourse. What he's interested in is the nature of human experience from the perspective of the one undergoing the experience. He's not looking at things from an objective third-person viewpoint—broadly speaking, what we might call the scientific viewpoint. He's looking at things from the first-person experiential viewpoint.

For example, we understand—if I remember my high school science correctly, and it was a long time ago so things could have changed—but in those days it was considered that the center of the solar system was the Sun, and the Earth orbited around it and rotated on its axis as it did so. Hence you have the illusion that the Sun rises in the east and sets in the west. That's from a third-person objective viewpoint. From a first-person subjective viewpoint, mate, the sun rises in the east and it sets in the west. It goes around us. Now, to say that the sun rises in the east and sets in the west is not to contradict the scientific third-person objective explanation. It's just a different perspective. The Buddha's not offering scientific explanations about what's going on. He's talking about how experience itself unfolds.

Sometimes I like to point out that you would not go to the Buddha to learn geography. I mean, he thought the world was flat. He thought there were four continents: one to the north, one to the south, one to the east, one to the west. A great mountain in the middle, and on top of the mountain are the gods. He lived in the southern continent, the rose apple continent. Surrounding the four continents is the great ocean, and holding the great ocean together is the great wind. As I say, you would not go to him for geographical advice.

This actually reminds me of when I was a monk in Thailand. I spent some time at a study monastery up north. This was essentially a school for novices, a seminary. What they were studying was the kind of monastic high school curriculum for Burmese monasteries—this was a monastery in Thailand that actually taught the Burmese curriculum. It was all based on memorization and it was all very traditional. I spent a bit of time there learning Thai and Pali.

One day we were out doing chores, sweeping the yard, and one of the monks who spoke some English came up to me with one of the student novices, a teenage boy. He said, "This seminarian has got a question for you." I said, "Oh, sure. What's the question?" The question was: "Is the earth flat?" I was a bit taken aback. I thought about it and said, "No, not really. It's round." This was explained to the boy. He looked a bit agitated and spoke rapidly in Thai. My Thai friend turned to me and said, "Prove it."

I thought about that one. Photographs. I've seen photographs. People have been up there, they've gone around it, they've taken photographs, and the photographs have been published. It's round. This was explained to the boy, and he looked very agitated and stomped off. The curriculum he was studying is medieval.

He's studying the classic Buddhist cosmology, and obviously he had heard rumors that his cosmology wasn't exactly correct. I confirmed it for him. I hope this did not affect his faith in the Buddha.

But we're not doing science here. We're doing something different. We're doing something experiential. So for the Buddha, when he talks about body, he's not talking about body the way a doctor would talk about body. He's talking about body from the perspective of *being* a body. He's talking about our experience of body.

And body for the Buddha has two meanings, a broad meaning and a narrow meaning. In the broad sense, body refers to all five physical senses: seeing, hearing, smelling, tasting, touching. In other words, the entire experienced physical universe is body. In the narrow sense, body is the fifth of these five physical senses, and it refers to sensitivity to touch. That touch can be internal or external. External touch would include the touch of the body against the cushion or the bench or the chair that you're sitting on. Internal touch would include any aches and pains within the body. All of these we refer to as touching.

But the key point is that body does not mean our concepts about body. Normally we do not directly experience the body. We experience body through a filter of concepts about the body. For example, we are obsessed about how our body appears to others and even to ourselves. Anybody got a mirror? How many times per day would you look at it? Well, Royal doesn't look at it at all—he's transcended that. Others would gaze at it with great interest. And what we're looking at is our concept of ourselves.

We also find ourselves lost in concept about the body when we come to do the meditation practice. We're given something basic and physical to be aware of—be aware of breathing, be aware of movement as you walk. And we find very easily that we're not really aware of the body, we're not really mindful of body, but we're mindful of our concepts about the body. For example, what we are supposed to feel in this practice, what is supposed to happen, what I am supposed to look like when I'm meditating. That's a big one.

Have you ever—here we've got individual rooms, so you've got privacy—but have you ever gone really mindfully towards the dormitory, mindfully gone down the corridors, mindfully opened up the door, stepped inside, closed it, and gone... "Thank God I'm out of view"? You can see how much the concept of body, what I'm supposed to look like, filters through.

If you ever do a self-retreat where you are completely alone, it's really interesting. The first time I did it, it took about two or three days for it to finally really click: no one can see me. There is no audience. And when it happened, it was like a real shocker. The way that I practiced just changed once that inner audience had disappeared.

So all of this is concept. It isn't the direct experience of body. What we're interested in with mindfulness of the body is what is really going on in the body, as distinct from any concept we have about the body. We'll talk more about this tonight, I think.

But for the Buddha, if we look beneath the concept—what's really going on underneath?

Well, Sayadaw U Pandita used to have this little parlor trick. He would raise his hand and say, "What's this?" When people recovered from the discombobulation, someone might be bold enough to say, "That's a hand." "Yep, very good, big tick." And then he'd go, "What's this?"

A fist. Yes, very good. And then he would open his hand and very slowly close it again, wanting to know: when is the moment when the hand became a fist? Because whatever moment you pick turns out to be the wrong one. Hand and fist are just concepts.

So what do we actually experience in the hand? If I have a meditation exercise in which I simply hold my hand out, close my eyes, and actually feel what the sensation is, then slowly start to close it—what I will get isn't hand and fist. It will be a whole series of discrete, separate sensations: hardness, movement, sharpness, heat, stickiness, stiffness, and so on. In other words, the concept "this is my hand" does not survive sustained awareness. What survives sustained awareness are the directly experienced qualities of the body.

These directly experienced qualities are what the Buddha calls *dhātu*, or elements. They're considered elements because when we start to cut through the concept about a direct experience until we finally come to the actual experience itself, we arrive at these individual sensations, individual phenomena. They are elements because after the concept breaks down, what we're left with are these. They are what survives sustained awareness.

For example, let's say I'm meditating on breathing, and suddenly I get lost in my thoughts. What I'm doing is living in a world created by these thoughts. During that time, this world seems real, although it's far away from here and now. Then suddenly I know that I'm thinking, and the world created by these thoughts vanishes instantly. This world did not survive awareness. It's not real—it's a concept, a fantasy.

So I come back to another world, and this is a world in which my left knee hurts and I really don't want to be sitting here any longer. But I'm following the meditation instructions, so I decide to note the distraction. I'm noting my painful left knee, and I discover that this painful left knee is actually made up of a whole series of sensations that

are coming and going and which actually hold my attention. After some time I realize that my world of "I don't want to be sitting here" has dissolved. It has not survived sustained awareness. Even my left knee dissolves, because all I know is a flow of sensations. The left knee has not survived sustained awareness.

So you can see it's a breaking down of the world of concept, progressively letting go and discovering a world made up of discrete, directly experienced phenomena. For the Buddha, this is the realm of the elements. This is the world that, when we do this practice, we're trying to enter and stay in.

Is any of this making sense?

So let's have a look at the world of touch sensation, the fifth physical sensitivity. This is body in the narrow sense. The Buddha says that these sensations break down into what he calls the four great appearances, the *mahābhūta*: earth element, fire element, water element, and air element. These are the elemental qualities of experience.

Earth element is the experience of resistance, from soft through to hard. Air element is the experience of all forms of movement—pressure, vibration, expansion, contraction, and so on. Fire element is the experience of temperature, from cold through to hot. And water element, which is the most obscure, is the experience of liquidity and cohesion. Liquidity is wetness and dryness; cohesion is stickiness and slipperiness.

Let's say I hold my hands up and start to bring them together. I'm experiencing movement, and in the hand itself there's a certain amount of hardness, stiffness. At some point the fingers touch, and at that point there's no resistance to further movement. That resistance at first is soft. If I keep moving the hands in the same direction, it gets harder and harder. This resistance is earth element. With that contact, there's also a spike in temperature—fire element. And of course there's movement—air element. These are the elements, and they are elemental qualities of experience.

You find the same four elements in the European tradition, but there they're felt to be objective aspects of the universe. The Buddha is saying something different: he's seeing them simply as aspects of experience.

So what we're going to do is have a brief tour of the elements as a meditation exercise.

Start to construct your meditation posture, working on it from the ground up. Begin with the contact at the base of the body, feeling those sensations, feeling the balance. From there, lift up through your spine. Relax your shoulders and let your head come into balance.

Let yourself become aware of what is happening throughout your body. At the bottom is the hardness and stability of your contact on the ground. Rising up from there is the lift and firmness of your spine. Around that frame there is a field of sensations coming and going.

Now turn your awareness to those parts of your body where you feel hardness. Where can you find hardness? Look for hardness. And when you find it, focus on it and name it: *hard*.

Now turn your awareness to those parts of your body where you feel softness. Where can you find softness? Look for it. And if you can find it, focus on it and name it: *soft*.

Once more, open your awareness to your whole body, experiencing your whole body.

Now turn your awareness to those parts of your body where you feel heat or warmth. Look for heat, warmth. And when you find it, focus on it and name it: *hot*, *warm*.

Now turn your awareness to those parts of your body where you feel cold or coolness. Look for cold, coolness. And if you can find it, focus on it and name it: *cold*, *cool*.

Again, open your awareness so you're feeling your whole body.

Now direct your awareness to those parts of your body where you feel wetness. Where can you find wetness? Look for it, and if you find it, focus on it and name it: *wet*.

Now focus on those parts of your body where you feel dryness. Look for dryness. And if you can find it, focus on it and name it: *dry*.

Once more, open your awareness to your whole body, feeling your whole body.

Now turn your awareness to those parts of your body where you feel movement. Look for movement. And if you can find it, focus on it and name it: *moving*.

Moving.

And now focus on those parts of your body where you feel stillness. Look for stillness. And if you can find it, focus on it. Name it.

Still.

Still.

Now once more open your awareness to include your whole body and open up to the flow of all the elements. Don't try to hold on to any one sensation. Don't focus in on any one sensation. But allow all of the sensations to flow naturally. Don't try to find anything in particular. Just be aware of whatever is happening within your body without trying to control it.

Coming out of that meditation, that was a quick tour of the elements. Of those different elements and their various aspects, which did you find easiest to locate, and once you found it, easiest to hold on to? Which were the most obvious ones?

Movement was mentioned. Did you find stillness? Some did, some didn't. One person found stillness and hardness in the same areas. So movement, pretty easy, straightforward. Hardness? What about softness? Did you find softness? A bit harder, not so obvious.

So our two candidates for easiest to find are hardness and movement. But interestingly, movement was experienced not as a discrete, separate element, but rather as part of the whole package.

What was the most difficult one to find? Stillness. Even what seemed to be still had a kind of tingling or buzzing. So even stillness was moving.

The stillness one is actually a relatively new addition to my teaching, because our element is the experience of movement. So I just had movement for years. And then one of the meditators objected. He said, "Look, for hardness you also include softness. For wetness you also include dryness. If you've got movement, you should include stillness." I thought, I can't argue with that. So I've included it. But it's a tricky one. Some people find it and some people don't.

Of course—and this is really basic—whatever you find is correct. You are never wrong. Your experience is your experience. Full stop.

One person mentioned they hadn't ever noticed the amount of movement everywhere. Good. Of course, according to the Buddha, these being elements, they're everywhere.

So if we talk about movement, the obvious place is in breathing. And breathing is geographically located in a particular part of the body. But air element is everywhere—everywhere in the body, and everywhere throughout the universe. The same is true for hearing and seeing, tasting. And I'm trying to think about it as I'm speaking—I suppose there is, you know, like the sound of rain, wetness. You might find those elements in the other senses as well.

One thing I always point out, and what I find very useful about this kind of exercise, is that you can find these elements in the mind. As far as I know, the Buddha never talks about them in the mind—he always just talks about them in terms of the body. But you can find them in the mind as well. Sometimes the heart is hard. Sometimes the heart is soft. Sometimes the emotion is wet. Sometimes it's dry. And so on.

I find it very useful that once you get a sense of these elemental qualities somewhere, which is simply in the body, you can start to open it up and recognise them everywhere. Which is very useful.

In our culture we throw around terms like "mind-body" as if they're separate. But as you point out, for the Buddha, they're interconnected. They're not separate. So he doesn't really talk about mind-body. He talks about nama-rupa, which we're going to be discussing more. That's the movement of mind to be aware of something, and that which is aware—they come together. So that which is aware could be what we would call body. There's a movement of the mind. And if you have one, you have the other. But that which is aware could also be mind—mind entangling with mind. Yes, interconnection, relationship—that's how the Buddha looks at things. But in the way we use language, we assume these are two separate realms, and sometimes they send ambassadors to each other.

Did anybody find that looking for these elemental qualities was hard work? Like you had to really focus to find it?

Some are harder than others.

Some are harder than others, for sure. One thing you notice here is your own sensitivity. For example, hardness and movement—earth element, air element. These generally are the two that most people find easiest to discover. And if you look at most of the meditation objects, they're earth and air. Breathing is air element. Sweeping the body, touch sensation—mostly earth element. And so on.

So one thing you're doing is mapping your particular set of sensitivities as it presents now. If you're looking for something to ground the awareness, you go for the obvious. If you can't find something, you never worry about it. You never concern yourself with what you cannot find. You just focus on what you do find, because that gives you awareness of something to hold on to. You can stay with it over a period of time. And as the mind becomes stronger and more sensitive, things which before were hidden will begin to come out. You begin to see them.

So it's a mixed package, and you're working with your sensitivities—you always favour what you're sensitive to.

Certainly these exercises are exercises in aim. Look for hard, not soft—hard. Now switch to soft, not hard—soft. We're learning to aim awareness precisely. And this is important for insight meditation.

For serenity practice, this kind of precision is not so important—you probably wouldn't bother with it. But for insight, it's essential. Insight meditation, as we'll explore more as we continue, is based on the perception of impermanence, the perception of change, of universal movement. And that means being able to distinguish between one thing and another—to see that this has changed into that. To perceive this clearly, the mind needs to be quite sharp, quite clear. So in this style of practice, developing that sharpness, that clarity, is really important. Working with the elements is an excellent exercise for cultivating that precision, because it opens up the perception of impermanence.

Take, for example, the word *vipassanā*, which is translated as insight. It's a compound word. *Passanā* is seeing, and the prefix *vi-* denotes separately, distinctly. So seeing separately, seeing distinctly. This is different from that. That is not this. This kind of perception is crucial for developing insight.

But as we said, to stimulate the mindfulness, always go for what is clearest and most obvious. Notice the difference between opening the awareness out to cover the whole field of the body, and focusing in, zeroing in on one particular aspect. Both approaches are good, both work, both are satisfactory—but you may find that one works better than the other for you.

Did anybody find a sense of relief when you opened up to the whole, to all of the elements? Yes? Like, "Ah, now I don't have to work so hard." So sometimes it's appropriate to go in for the detail, but if you find that stress or strain is being caused by this effort, then it can be good to drop it and simply open up. And to learn to move between one and the other. The Buddha talks about malleability, or the pliability of the mind, as something we cultivate in meditation practice. If I want the mind to go here, I can send it here. If I want it to go there, I can send it there. This is part of the craft we're learning.

A participant asks: When you talk about focusing and being able to name hard, soft, cold, hot—and that naming has the capacity to resolve discomfort—what's happening there?

The naming was very much part of this exercise. And the naming is part of clarification, precision. What exactly am I aware of? So that helps to clarify the experience, and you get a sense of what the naming is for. But basically, when you zero in on something, it starts to break up into its component parts. We take something to be one, but when we examine it closely, it turns out to be more than one.

The classic example is the self. I take myself to be one—that's me. But if I'm actually looking at the flow of experience, I realize that what I consider "me" is actually a whole bundle of experiences, reactions, and sensations. The Buddha talks about—I forget the exact terms—a perception that sees things in bundles and the perception that sees them as separate. It's teasing things apart. And this teasing things apart is very much part of the insight process.

What we take to be a solid something, which we can identify with—"this is me" or "this is mine"—when we start to really examine it, we see that actually it isn't solid. It's broken up into all sorts of different processes. These processes are in relationship with one another. They move according to different relationships. And "I" disappear in the midst of them.

The classic example with painful sensation: "I am hurting." We start off with that. Okay, well, what is hurting? So I'm interested. I send the awareness to the sensation. And I find that there are different sensations coming and going. Then I notice that it's not just the sensations—there's also what the mind is doing.

And the mind has aversion. I really don't want this. I want it to end. So I can switch to there—I can just see the aversion itself. Again, the elements can be useful. I find aversion is often hard. There's a hardness in the heart, as it were.

And then I can say, well, actually, what I'm taking to be one solid thing—"it hurts"—is actually a collection of sensations and a collection of psychological responses that come together and produce this. But you challenge any one of these, and the whole thing collapses. So if I've got the sensation but I don't have the aversion, it's not pain. It's something else.

So it's a breaking apart. You could say insight involves two basic movements: analysis and synthesis. Not analysis in the intellectual sense, but analysis in the sense of breaking things apart. And then we bring them together again in a different way. And for the Buddha, it's bringing them together again in a way that does not involve a self. That is what opens up the world of insight.

So you can see that what we're doing in this exercise is starting the breaking-apart process and getting used to that. And it comes from the habit of, first of all, not taking anything for granted, not assuming that we already know, and being precise with the actual direct experience. What is this? What is this? What is that? And if we practice accordingly, things start to break up.

Any questions or comments? Clear as mud?

Alright, your mission, should you choose to accept it, is when you can, be more precise with your awareness. Now you might have noticed that being precise takes a lot of energy. And what you'll find is you can't do it all the time. The mind becomes tired. So fine—sometimes you're quite general with the awareness, and sometimes you zero in and you're quite precise. Learn to move between one and the other.

And you might find that those parts of the day when you're most wide awake are the parts where it's most appropriate to go in for the detail, to really see what exactly is going on here. At the Mahasi Centre, the way Sayadaw U Pandita taught, we used to have interviews six days a week, and he would want you to report what you thought was your best sitting and your best walking session—detailed analysis. So you had to be really precise in order to satisfy his demands. And what I found, and what a lot of people found, was that each day when you went in, you would report the sitting and the walking at the same time of day. There would be a time of day when you would peak, when you were at your sharpest, and that would be the sitting and the walking that you would tell him about. Regular as clockwork, it could be. It's quite remarkable.

So you do find that there are certain times of day when the mind is clearest and sharpest. That's when you do this kind of work with the elements. There are other times of day when the mind is much more dull, or at least not energetic. Then you open up and do a more general awareness. You work according to your rhythm. Biorhythm has a lot to do with it.

Okay, thank you very much.

CHAPTER 35

What Is Real

Patrick Kearney · 50 min

> *In this profound teaching from a month-long Satipaṭṭhāna retreat, Patrick Kearney investigates the fundamental question at the heart of insight meditation: what is actually real? Drawing from the Dvayatānupassanā Sutta, he presents the Buddha's radical claim that 'whatever is regarded by the world as true, cultivated practitioners have clearly seen as false' — suggesting that our ordinary perception is fundamentally mistaken.*
>
> *Kearney explains that our view of reality is deeply conditioned by avijjā (delusion), which is not merely ignorance but actively holding false views we believe utterly. This delusion operates through habit, which contains the assumed conviction that we already know what's happening. The practice reveals how we spend most of our time absent rather than present, caught in fantasies that seem real — especially when charged with emotion, which provides present-moment power to our mental constructions.*
>
> *The teaching offers a practical criterion for discerning reality: what is real survives the practice of presence. Random thoughts evaporate instantly upon recognition; emotionally-charged fantasies persist longer but eventually dissolve. Through the spectrum of directed and undirected awareness, practitioners learn to recognize presence itself rather than struggling against distraction. Referencing his early training with Sayadaw U Paṇḍita at the Mahāsī Centre, Kearney emphasizes that while being aware of everything throughout the day seems impossible, being aware of what is happening now is always possible. Ultimately, even dukkha dissolves under sustained presence, revealing that our deepest problems are not as real as they appear.*

So tonight we're going to talk about what is real. This is something of a follow-on from what we were doing this morning when we looked at the elements.

If we're practicing insight meditation—what the Buddha calls vipassanā bhāvanā, the cultivation of insight—this is what we're practicing, which means, surely, that we want to know what's really going on. The project assumes that we accept that right now, as we get started, we do not know what is going on. We realize that we don't really know what's going on. In other words, we assume that we are mistaken in how we see ourselves and how we see our world.

For the Buddha, this is a reasonable assumption. He points out that our view of ourselves and of the world is conditioned. It's conditioned, for example, by events completely out of our control—the circumstances within which we were born, over which we had no say, along with the particular collection of sensitivities and capabilities that we were born with. Our view is also conditioned by the decades of choices that we've made throughout our life and the kind of life that we've led. This second aspect involves the teaching of karma, our kamma-vipāka, action and its ripening.

We are conditioned beings. For the Buddha, one of the major conditioning forces that shapes our lives is what he calls delusion—avijjā, or sometimes moha. In other words, we tend to believe things that are not true. Most people, I suspect, are conditioned to believe that our happiness and welfare is based on our income. But is it, really? Or does the dedicated pursuit of consumerism lead in a different direction?

If we are deluded, which is what the Buddha thinks, this means that we think we know what's going on, but we don't. The Pali word avijjā—vijjā is knowledge or knowing, a is the negative—so avijjā can be translated as "not knowing," ignorance. But the negative can be stronger than a simple "not." It can mean the opposite, like our English "anti." This is where you see translations like delusion. We are ignorant of what's going on, but for the Buddha, we're more than not knowing. We positively have views which are completely mistaken, and we believe in these views utterly.

We think we know what's going on, but we don't. As a result, we chase after what is not real, thinking that it is real, and we chase after what does not satisfy, thinking that it does satisfy.

This is one way that the Buddha expresses this. It comes from a sutta called the Two-Fold Consideration, the Dvayatānupassanā Sutta. He says: "Whatever is regarded by the world as 'this is true,' cultivated practitioners have clearly seen, realistically and with complete understanding, as 'this is false.' This is the first consideration."

"The world" means most of us, ordinary people, versus cultivated practitioners—mature practitioners who have developed insight.

"Whatever is regarded by the world as 'this is false,' cultivated practitioners have clearly seen, realistically and with complete understanding, as 'this is true.' This is the second consideration."

It's quite a powerful statement. Basically he's saying most of us have no idea what's going on. One thing implied by this is that what is really happening may be what we least expect. This further implies that if we want to discover what's really happening, we have to be very wary of our assumption that we know what's going to happen next. Because what we think will happen, won't. In fact, what we think is happening, isn't.

This comes up in our practice again and again. As the practice matures, we realize we will be taken by surprise—that this is built in. A willingness to be surprised, I think, is essential for this practice.

So we don't know what's going on. We tend to assume that we do know. As a result, we make all sorts of mistakes. How do we find out what's going on? For the Buddha, you do this by practicing presence—cultivating mindfulness, what the Buddha calls sati, which is recognized as the felt continuity of awareness. By "felt" I mean it's a discrete experience, and by "continuity," I mean awareness sustained over a period of time.

Or we could simply say the cultivation of sustained presence. We learn to be present to whatever is happening—to be deeply, intimately present with what's happening—without being led astray by our assumptions that we already know what's going on. We train ourselves to be alert only to the present, only to what is actually happening now. And we train to stay with this which is present now and to track it over time, to see what it does.

When we do this, some things become pretty obvious pretty quickly. For starters, we learn that staying present is very difficult. And in fact, if we're clear about it and honest about it, we have to admit that most of the time we are absent. We try to do something very simple, like following the breath, and we very quickly find ourselves caught up in a fantasy. Gradually we come to realize that most of the time we are not actually present. We were talking about the secondary object yesterday—an important part of the job of the secondary object is to show us vividly and clearly how most of the time we are absent, not present. And if that's the case, then it's no wonder that we actually don't know what's going on.

When we practice, we begin to realize that most of the time we're caught in fantasy. What we take to be real now, we later realize was fantasy, was not real. But it can take us a long time to accept that our fantasies are not real. When we state it like that, it seems pretty obvious that our fantasies are not real. But it's in the nature of fantasy that when we're caught in them, they seem real.

For example, we may be filled with anticipation about what will happen in the future. We may be caught up in our hopes, our fears, our expectations. And when we are clear, we can see that none of this is real. It's obvious that this is today—it's not sometime in the future. Sometime in the future doesn't actually exist. But when we're lost in a fantasy about next week, we are convinced in that moment of complete absence that next week is real. It's even more real than today. And then at some point we realize, oh, it's just fantasy. We realize that it really is today, not next week. But for some time we were fooled.

This is particularly the case when our fantasies are fed by the power of emotion. That's when the fantasies seem particularly real. I might be thinking about the future and I can see that the stories I'm telling myself about the future are not real. But if these stories are fed by strong emotion, then it's a whole different situation. Because the emotion is real—it's happening right now. The fantasy is about the future, but the emotion is happening in the present, in the sentient body. And the fantasy gets its power from the strength of the presently experienced emotion. That's when fantasy really seems real.

Even when we snap out of the fantasy, we may find that the emotion itself sticks around for a while, that it only gradually fades. But once it ceases, we can look back and we can appreciate that it too was not real. So we're fooled again, but this time for longer.

We do have this tendency to fall into delusion, to imagine that what is not real is real. So how do we know what is real? How do we stay grounded in what is real? The basic principle that this practice is working with is that what is real is what survives the practice of presence.

We played around with this this morning, with the elements. What is real now in the body? Is there hardness? Is there softness? Is there movement? Is there stillness? What we're doing in these exercises is getting beneath the surface appearances, getting beneath what we assume is real, and having a close look at what's actually happening. When we do that, the experience starts to change.

Take, for example, the distraction of random thoughts. We're caught up in thinking, but the thinking is quite random. The moment that we realize we're caught in these thoughts, in that moment they disappear. They evaporate immediately. In other words, they cannot survive presence, even for a moment. As soon as I know that they're there—bang—they're gone. So they're definitely not real. But if we have a fantasy that's charged with emotions...

it survives longer. But even emotion cannot survive presence for long, because when we are present, what is false evaporates. What survives presence is real.

And this uncovering is a gradual process because our delusion has depth. We snap out of one fantasy only to find ourselves in another. Essentially this is because we are in the habit of being absent most of the time.

This brings us to the problem of distraction. We've already given the example looking at the nature of mindfulness. Have you ever had an experience like you're driving down familiar streets and you suddenly realize you have no memory of the previous three blocks because you were caught up in thinking? So what happened in that kind of experience? We were driving and we were present to our driving, and then suddenly we were absent. We were out to lunch, as they say. We continue driving in that state of absence when suddenly, again without warning, bang—we're present. And we know we are present in part because we can look back and realize that in the past we were absent from the scene. In other words, we are now present to our previous absence. This is an experience of what we normally call distraction.

So why are we so easily distracted? Let's go back to our driving example. If the streets that you were driving down were entirely unfamiliar to you, if you were carefully navigating your way and anxious to avoid being lost, would you be distracted so easily? Probably not. The key to the example is that when we lose it, when we fall into habitual absence, the streets we are driving down are familiar. We might say we know them like the back of our hand. So we don't need to make any effort to navigate. We already know where we are and where we're going. At that point, habit snaps in and we drift off into thought. In that moment, we are distracted but we don't even know that we are distracted. We are absent. We are not present.

When we look at what most often destroys the quality of our engagement with what is really present, what is really going on, we find it's habit. This is because habit contains the assumed conviction that we know what is going on, along with the responses that come from that assumption. Habit is central to our delusion, because when we are lost in habit, we react without awareness, because we assume we already know what is happening. So we go to sleep, and we act out of that state of oblivion.

In this practice it's important that we stop assuming that we know what's going on—that we actually start to pay attention. It's vital that we refuse to take anything for granted, especially what we take to be real, what we take to be normal. Because where does our sense of normality come from? It's a product of our blindness and a product of our habitual deluded responses.

As the practice deepens, we uncover what is conditioning us and what is conditioning our reality, our sense of reality. These are our buried assumptions, our unconscious drives and needs. This is what the Buddha calls the āsavas. He translates them as influences. The old translation is cankers—I don't know if you've ever come across that. The Buddha doesn't like cankers.

But the challenge in the practice is: do not take anything for granted. Remain radically present to what is happening now.

When we try to do this, again, we get tripped up by distraction. The result is we cultivate a certain relationship with distraction. We often dismiss distraction as an interruption to our meditation practice. Have you ever had that response, that feeling?

The distraction is an interruption, it's just getting in the way. In other words, we think that our experience can be cleanly divided into two aspects: meditation object, which is good, and distraction, which is bad. But when we have that attitude, we're completely missing the point. The point is to find out what's really going on, including what's really going on with distraction.

So it's important not to dismiss distraction, but simply return to presence. And of course, returning to presence embraces distraction, because sometimes what is present *is* distraction. Do not try to avoid distraction—for a start, it's impossible. Instead of trying to avoid distraction, cultivate presence. Learn to be present to distraction by recognizing now what is happening now.

Let's look at how we might play with that in the meditation practice. We've talked about directed awareness and undirected awareness, what Mahasi calls noting and noticing. When we direct awareness, we make a choice to turn towards and aware something, and of course that something becomes our meditation object. But our mind fights us. It wants to roam wherever it decides. We do not decide to slide off into distraction—our mind decides. And it follows the well-worn tracks of habit that have been cultivated over decades. So we find ourselves in a struggle between meditation on one side and distraction on the other, and often we can't help but notice that we are on the losing side.

So what's the alternative? One alternative is to play with the spectrum of directed and undirected awareness. When we become sensitive to the movement between these two, what we find is a flow between presence and absence, and back to presence again. This flow is just part of nature, to be accepted as what is really going on—and therefore worthy of study.

When we are not sensitive to this spectrum, when we're trying to hold onto directed awareness exclusively because this is our meditation, then we find ourselves living in a hierarchy of meditation object versus distraction. The meditation object is good and distraction is bad, so we try to avoid distraction. And when we realize we are distracted, we run away from that experience to something more acceptable. We create a situation where meditation becomes work, from which we want to take regular holidays. Have you ever had that relationship in a meditation retreat? Worse, meditation can become a war where the enemy is ourselves, and so we are bound to lose—whoever wins.

Instead, what we might try to do is cultivate recognition of what we already know. We played with this before in the recognition of posture. So right now, are you sitting? Do you know you are sitting? Maybe you forgot. Maybe you were so caught up in this fantastic Dharma talk that you completely forgot your posture. But how difficult is it to remember? Right now, I am sitting. And once we remember, do we have to deliberately direct awareness toward sitting? Or do we simply recognize what we already know? Do we have to get back from somewhere, or have we already arrived?

Learning to recognize what we already know—this happens when we remember awareness itself. If we discover this, we may find ourselves in a situation where we do not have to struggle to maintain a practice. We're not struggling to be present. We simply recognize that we are already present.

Presence itself involves both directed and undirected awareness. If we place too much emphasis on directed awareness, we find ourselves bouncing between meditation object and distraction, accompanied by all the attitudes and judgment that go along with this. When we're present to the whole spectrum—a flow between directed and undirected awareness—what we find is a continuity between presence and absence.

They're no longer opposites. They're more like different sides of the same coin. Because absence is inevitable. The real issue becomes: how do we transition between presence and absence and back again? There's no need for any hierarchy of superior or inferior. And there's no need for any judgment of ourselves or of our experience. There's just the flow of awareness. Present, absent, present, absent.

And one thing we might begin to realize is that fundamentally, presence is more important than what is present. Our obsession with distraction is one aspect of our obsession with the content of our experience. We think certain things should be happening, and certain other things should not be happening. But in mindfulness practice, what's important is presence itself, not what we are present to. That we are distracted does not matter. What matters is that we learn to become present—for example, to our distraction.

The one key point is this: we can only be present to what is happening now. Presence involves intimacy. And intimacy does not care what is present. It does not care whether we think of what is present as being a distraction or whether we think of it as a meditation object.

Now, I'm not simply dismissing meditation objects. Meditation objects can be useful because they provide a stable point from which we can look out at what's going on. We've been talking about this in terms of a grounding object. The meditation object gives us something to do while we wait for something to happen. But of course, what are we waiting for? We're waiting for what is already happening, but which we might be too busy to notice.

Immediacy is only concerned with now and what is happening now. So don't get caught up in progress. Don't get so caught up in progress that you miss what is happening now because you're busy waiting for the meditation to come good sometime in the future. Don't get trapped in images of what should be happening or what should not be happening. The only interesting question is: what is happening? Because what is happening is what is real.

Which brings us back to where we began. In the lineage of Mahasi Sayadaw, the basic practice is described as noting, which means being directly aware of whatever is happening now. We begin with the body, with physical experience. And we do this for purely pragmatic reasons: for most people, the body is easy to be aware of and relatively easy to stay with over a period of time.

As we're directly aware, we notice that whatever we are aware of changes. Nothing is stable. Nothing stays still. Experience is dynamic. And where does this dynamism come from?

Let's look at what the Buddha says in Dhammapada, verses one and two. The Dhammapada is a classic collection of verses, each with stories attached to it. In the Theravada tradition, it's a real classic. But there are Dhammapadas in other Buddhist traditions as well—each tradition created its own collection of verses. The Theravada Dhammapada begins with these two verses:

Mind shapes experiences. Mind is first. Experiences are made by mind. If we speak or act with corrupt mind, pain follows us like a wheel follows the ox's foot.

Mind shapes experiences. Mind is first. Experiences are made by mind. If we speak or act with pure mind, happiness follows us like a shadow that never leaves.

These are very famous opening verses. Notice the image: if we speak or act with corrupt mind, pain follows us like a wheel follows the ox's foot. The ox is pulling a heavily laden cart.

And it's really working. It's really slogging away. The cart is full. There's somebody sitting on the cart giving the occasional biff to the ox to get it moving. Slog, slog, slog, slog. That's if we speak or act with corrupt mind. But if we speak or act with pure mind, happiness follows us like a shadow that never leaves. If you're walking along on a sunny day, have you ever felt that your shadow is holding you back? That you're dragging this heavy weight of the shadow? You don't even notice it.

What we want to focus on in these two verses is the mind itself, talked about in terms of its activity. "Mind shapes experiences. Mind is first. Experiences are made by mind." The Buddha is directing us to look at what the mind does—to look at its activity, its dynamism. When we note something, when we are directly aware of something, we feel the mind moving toward that object. Breathing, physical sensation, whatever. Mind is active. Mind is doing. Body, as a meditation object, is not doing. It is done. It is shaped by mind. It is targeted by mind. But the dynamism is in the movement of awareness itself. And this movement of the mind towards an object comes from a choice made now to be aware. This is the work we're undertaking: now, make the choice to be aware.

Decades ago, in 1984, when I first started practicing in this lineage, I spent a week at Mahasi Centre in Rangoon. In those days, you could only get a one-week tourist visa. There were no meditation visas. You could only get into Burma for one week. So I popped in there, travelling between India and Thailand, and walked through the front gate. They admitted me, which was nice of them, and I was instructed to turn up from eight to eight-thirty every morning for instruction by the monk whose job it was to teach the foreigners.

At the time, that monk was Sayadaw U Pandita, who was also the head monk of the place. He'd just taken on the job of teaching the foreigners, and because he was very busy, he only had thirty minutes a day in which to do it. But when I turned up, I was the only foreigner. So I had thirty minutes a day with him, which was a very good introduction.

At some point during that week, U Pandita gave me a very clear instruction. He said, "Look, what this practice is all about, what you're here to do, is this: be aware of everything that happens throughout the day, from the moment you wake up in the morning until the moment you fall asleep at night, right down to the blinking of your eyes. That's your job."

When he told me that, my response in my mind was, "That is impossible." But I had been there long enough to know that the correct response was, "Yes, Sayadaw." That's what I said, and I went off and gave it a go. I have to admit that after a day or so, I decided it really is impossible. I was right. It just can't be done.

But what I realised was that what is possible is to be aware of what is happening now. It's impossible to be aware of everything throughout the entire day. But it's always possible to be aware of what's happening now. And that is the key: the choice made now to be aware.

So the mind's distinguishing characteristic is movement.

Movement toward its object. And the movement of awaring is clearest, according to Mahasi Sayadaw, when the object we are awaring is clearest. If that object is clear, the movement towards it is clear. So look for what is clear and obvious, and aware it now.

As we were discussing, we start with the obvious. We use questions like: What is obvious now? What is clear now? Or we could give ourselves something specific to aware, something which is clear and easily found. It could be the breathing—what is my experience of breathing now? It could be physical sensations—what is the clearest sensation in my body now? It could be my posture—how is my body arranged now? We start now with that which is clear, that which is obvious.

If we maintain awareness over a period of time, if we're committed to this job, this involves effort. And effort is found in the commitment to renew the choice to aware again and again. In other words, to renew it now. Because once we make the choice, it's already over—it's a new now, and it's time to make the choice again. The commitment is to do this despite all the obstacles that the mind throws up to persuade us to postpone this choice. For example, to postpone the choice to aware until circumstances are better: "After a day or two when I've settled down, it would be much easier."

So what to do if obstacles come up? When do the obstacles come up? Now. Choose to aware the obstacle. Actively aware whatever seems to get in the way. This is what we've been calling the secondary object.

The traditional aim of the practice is the experience of Nibbāna—in English, nirvana. Nibbāna is the complete cessation of dukkha, the complete cessation of pain. And why do we come to meditate? Let's face it—why would otherwise sensible people spend their month's holiday at a meditation centre instead of going to a resort where they can enjoy themselves? What are you doing here? Why do we come? It's because we have dukkha, and we know we have dukkha, and we want to do something about it. That's why we're here.

So we are driven by our dukkha, which means that dukkha sets our agenda. But the Buddha is saying that dukkha is not real. Dukkha also does not survive presence. Continual presence dissolves pain. Our problems feed on our absences, and the more continually and radically present we are, the more our problems dissolve. Because ultimately, as far as the Buddha is concerned, our problem is not real. It's a fantasy.

What's real is this—what's happening now. Just immediate intimacy, about which fundamentally nothing can be said, because any words that we weave around it are just words woven around. And this now is always available. It's available right now. When we learn to take refuge in the present, what we find is that our suffering will dissolve.

And keep in mind that presence cannot be postponed. The choice is made now or it's not made. Presence is not something that is going to happen tomorrow or next week. Presence is happening now, or not at all. So please use this retreat as an opportunity to cultivate presence.

A question arose: "In the beginning you said that fantasy is charged by emotion for survival. But the emotion itself—does that survive?"

No. The stronger the emotion, the sooner it departs, because it requires so much energy to maintain it. But when a fantasy is fueled by emotion, it seems much more real, because the emotion is real in the present.

"But emotion itself—is it real?"

The emotion itself is real because it's powerful. We feel it in the body. But does it survive the present? Have you ever had an emotion that never goes away?

"No, but it sometimes lingers for a while."

It lingers for a while. And so that makes it more real than, for example, a fantasy about some random subject. A random thought that has no emotional charge—you realize, "Oh, I'm thinking," and then it's over. But a story I'm telling myself which is fueled by emotion could last for hours, could last for days. Yet sooner or later, it ends. What gives it that sense of reality is the emotion itself. And the emotion is felt very intensely because it's in the body. So it carries much more charge and it lasts longer. But it too ends. It too dissolves. And then I look back and realize, "No, that was a fantasy. I was caught up in something that actually, right now, doesn't exist."

"And emotion is something you don't have control over."

That's right. Again, it's conditioning. We are conditioned. Our experience is deeply conditioned. This is part of the Buddha's teaching of dependent arising. And this is why his teaching of karma is so central. Karma literally means action—but it's action that comes from choice. And again, it comes back to choice.

Classically, let's say I'm meditating and I slide off into a fantasy. I don't know that I've slid off into a fantasy—it's conditioned by the past. Then suddenly I know I'm thinking. And as soon as I know that I'm thinking, I'm faced with a choice. Well, I could just finish this story off. Or I could simply drop it now. That's the karma. That's the choice. And that choice conditions my future experience.

So if I make the choice to simply be present—right now it's just "I'm thinking," that's it—then the habit of being lost in thinking weakens. The choices that we make are really, really central for the Buddha. This is the whole teaching of karma. Becoming sensitive to the choices that we're making right now is an important part of the practice—and also recognizing how much of my experience I can't do anything about.

It's conditioned by the past. But there's always one bit of my experience where I have a choice. And the Buddha says, this is really, really important. Pay attention to it and see if you can make a good choice.

This is the balance between samadhi and sati, between concentration and mindfulness. Part of the role of the grounding object is to develop samadhi, concentration or unification. This is the stability of the mind, and this gives depth to the experience. The job of the grounding object is to provide that stability and stillness and depth.

If we spend too much time on secondary objects, particularly in the early stages when we're getting started, many people will find that they just fluff about. They're just drifting from one thing to another. So they feel that they need to really stay with the grounding object.

Now again, we talked about this very early on. A lot depends on the individual. For some people, they really need something to hold on to. They really need a clear grounding object to stabilize the mind enough so they can begin to see the movements of the mind and the body without getting swept away. So, grounding object, grounding object, grounding object, stick with the walking. Other people find that just ties them up in knots, and it doesn't really work for them. They find that they can settle much more easily if they open up, and they're more oriented towards what we call the secondary object.

So it does depend on individuals. It's not that one single technique fits everybody. Part of your job as a meditator is to find out what works for you, what strategy works best for you.

The basic principle of this style of practice is that mindfulness leads concentration. The emphasis is on developing mindfulness. If the mindfulness gets stronger and stronger, the concentration will follow. Other forms of meditation lead with the concentration. First develop the concentration, and the mindfulness will come along in its wake. So you can go in different directions. In a general sense, this style of practice emphasizes mindfulness. But even then, some people, and it's partly an expression of their personality, really emphasize the concentration aspect of it.

For example, in the formal sitting and walking, they're really going for slow, deliberate movement. In the sitting, really staying with the grounding object. And in the ordinary daily activity, that's when the mindfulness comes in. But other people find that doesn't work for them. So they have a different relationship. It's up to you to decide what relationship suits you best.

I remember one student who used to practice here. There was one retreat that she did, a nine-day retreat, and she was really going for the concentration. She was not mucking around. And she was moving so slowly that when the bell went for lunch and she was in the hall, it took her an hour to get to the dining hall. I'm not exaggerating. The staff would keep the food warm for her. And it would take another hour to get back down. It was really slow walking, and she went really, really deep. But what she was doing was quite deliberately doing a samadhi or concentration-oriented style of practice. Other people, if they tried to do that, their heads would explode and they wouldn't get very far. So they do something else.

It's very much like you use the basic structure and work out what's my relationship to it, what works for me. But the general principle is stay present to whatever is happening. Does that make sense?

If you're forcing it, then the best thing to do is to speed up. Because what we want to do is to be mindful, to be aware the whole day. If I'm forcing something, I cannot do it the whole day. I just fall over in a heap at some point. So with right effort, sustainability is really important. What relationship can you have to experience that you can maintain over the entire day?

That's the key point. Now sometimes in a day, you'll be really focused and high energy. At other times of the day, you won't be, because you simply don't have the energy. So again, you adapt to individual circumstances.

The term that the Buddha uses is *manu*, which is one of the terms for mind. But I think what he's getting at by mind is the whole process of knowing, of awareing. So both the kind of elemental quality—I know that this is the in-breath, I know that this is the out-breath—but it's also perception, feeling, the judgments about it, the whole bundle of relationships that I project onto the experience. I think that's what he's talking about there.

Tonight was very technical, but not to worry. As the month goes on, we'll get even more technical.

CHAPTER 36

Tracking Breathing (Workshop)

Patrick Kearney · 45 min

> *In this practical workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney leads participants through a series of experiments designed to investigate the breath as a meditation object. Rather than prescribing a single correct approach, he invites meditators to discover how breathing actually presents itself to them—exploring where sensations are clearest, the directions movements travel, relative lengths of in-breath and out-breath, and even the space within which breathing occurs.*
>
> *The discussion that follows reveals the remarkable variety of experiences among practitioners. Some find clarity in the abdomen, others at the nostrils or ribcage. For one student, focusing on direction transformed a typically stressful relationship with breath meditation into something workable. Kearney shares how another long-time practitioner finally connected with the breath by attending to the space around it rather than the movements themselves. This illustrates a core principle: there is no single correct experience, only what is actually presenting now.*
>
> *Kearney addresses common difficulties with breath meditation, including its unsuitability as a grounding object for those with respiratory conditions or anxiety. He explains how the precision required in noting details serves the larger purpose of perceiving impermanence (aniccā)—if meditation feels boring and repetitive, one simply isn't paying close enough attention to see change. The workshop emphasizes a playful, experimental approach while cautioning against the common tendency to interfere with or control the breath, which can create a fabricated 'meditation breath' that takes years to undo.*

This morning we're going to look at breathing as meditation object. Breathing is probably the most common meditation object in the world of Buddhist meditation. It's practiced by the Buddha, taught by the Buddha, recommended by the Buddha, so it comes highly credentialed. Although, as I think we mentioned, it's not necessarily the best grounding object for everybody. For some people it's quite a difficult meditation object. But what we'll do is a series of experiments in breathing meditation, and then we'll see what happens as a result.

Settle into your meditation posture, constructing the posture from the ground up. Be aware of the sensations at the base of your body, and from there lift up through your spine. Relax your shoulders and let your head come into balance.

Let yourself become aware of what is happening throughout your body. At the bottom is the hardness and stability of your contact with the ground. Rising up from there is the lift and firmness of your spine. Around that frame there is a field of sensations coming and going.

Are you breathing? How do you know you are breathing? Isn't it the experience of movement within your body—movements of breathing in and breathing out? Bring your awareness to these movements of in-breath and out-breath. Where are these movements clearest and most obvious to you? In your belly? In your midriff? In your chest, in your throat, shoulders, or head? Focus wherever these movements are clearest and most obvious to you.

If there are movements, these movements must be going somewhere. In what directions do these movements of your in-breath and out-breath travel? Are they vertical, moving up and down? Are they horizontal, moving in and out? Are they curved or curly? Do they expand and contract? Focus on directions. In which directions are these movements going?

Let's assume there are two movements, one for your in-breath and one for your out-breath. Is the movement of your in-breath longer or shorter than the movement of your out-breath? Is the movement of your out-breath longer or shorter than the movement of your in-breath? Which one is longest? Which one is shortest? Or are they of equal length? Focus on length.

Is the movement of your in-breath clearer or less clear than the movement of your out-breath? Is the movement of your out-breath clearer or less clear than the movement of your in-breath? Or are they both equally clear, or both equally obscure? Focus on clarity. Which one is clearest? Which one is least clear?

Can you see the beginning and the end of the movement of your in-breath? Can you see the beginning and the end of the movement of your out-breath? Or are you missing parts? If you are missing parts, which parts are you missing? Focus on beginnings and ends.

Movement happens within space. Can you find the space within which your breathing moves? For this one, do not focus on the movements, but open your awareness to the space through which these movements travel. Can you find it? Don't worry if you cannot. Do not strain to find it.

Just notice the movements and feel the space around them. You need to be precise and detailed in your awareness to do these exercises.

As you do them, do you feel any sense of strain in your mind? Do you feel any tension in your body? Do you find yourself interfering in any way with the movements of your breathing? If any of this is happening, step back from the details of the movements and relax. Be aware of the movements. Don't do the movements. Be aware. Don't do.

So where were they? Where were they clearest and most obvious?

In the abdomen. And entrance at the nostrils. Simultaneously? Yes. So simultaneously up here and down here. And that was consistent? Pretty much. Sometimes it was just the nostrils, sometimes it was just there.

Anyone else? Where were they clearest? Belly? Ribcage. Is that normal, finding it in the ribcage? Not abnormal. So just today, that's where it happened to be. And for you? Beginning with the solar plexus, but gradually it dropped down as the whole thing progressed.

You notice that we start with what is clear, what is obvious. That's the basic place to start. If you're practising mindfulness—and we're talking more about mindfulness here—but in the tradition, when they ask the question, "What gives rise to mindfulness?" one of the answers is a clear perception. So if something is clear, you can cultivate a continuity of awareness on it. Look for what is clear.

In the different mindfulness techniques that come down to us, when we're presented with the recommended primary object or grounding object, the reason why that was selected was because the people who created the method thought this would be clear. So go for what is clear. If we settle awareness on what is clear, what is obvious, and stay with it, the mind will become stronger, clearer, more subtle, and what is originally hidden will emerge quite naturally.

What directions were they travelling in?

I think direction was the easiest to stay with. Initially, lying down, there's the expansion and contraction—the change in the horizontal direction. Through the nose, I thought it was kind of in and out, but then at some point I realised it was actually more curving around.

So you found direction really useful? Yes. Normally I find focusing on the breath quite traumatic. I find it activating and a bit stressful.

Keep playing around with the direction. But the more general principle is—well, first of all, breathing can be problematic. For a lot of people it's problematic. It's problematic for me because I've got lifelong asthma, bronchitis, and so on and so forth. So when I started meditation back in the day, and there were these books that

went on and on about the glories of breathing meditation—how mystical it is, how you become one with the universe, how the universe breathes through you, and so on and so forth. And I thought, "I have no idea what they're talking about." Breathing is a struggle to survive as far as I'm concerned.

So if breathing is problematic, first of all, you don't treat it as a grounding object. It's simply not suitable. Secondly, you treat it as a secondary object. Basically, when it swims into view, you acknowledge it—okay, here it is—but you go for something that is clear and obvious to you and not upsetting. And in this case, it was the direction.

One student shared: "For the last four months, I've had this chronic nasal congestion, and I'm asthmatic as well. So at one point, after the direction exercise, doing whatever came next, I got this wave of emotion and tears started coming. And then, of course, the nose got more blocked. And so breathing through the mouth and being self-conscious that I'm making too much noise—I just had to skip ahead."

Did anybody find the space within which you breathe? You found it? And it was also in the abdomen, so you could actually feel your abdomen expanding. Was that sense of looking for the space clear?

"It's a familiar kind of thing."

Anybody else find space? Did anybody think, "What the hell is he talking about?"

"I have a sense of my physical boundaries. There's space in my breath that I've got to find. But the challenge was—I didn't really understand the question."

When I drop in these things, they can be quite discombobulating. Or they can make perfect sense. You just don't know until you try. But the reason I introduced space was that I had one student who had been meditating for a long time. And one time in an interview, he said that he had finally clicked with breathing meditation—after struggling with it for years and years, he finally clicked. I asked him, "So how did you do it?" And he said, "I just forgot about the breathing and focused on the space within which the breathing happens." And there it was, perfectly clear. So I decided to add it to the script.

These things are quite mysterious—what the mind will hit on. And this I can get. So in your case, it was directions. And the space too. Good.

You never know. Some of these things that I toss in are completely obscure. You might think, "I have no idea what you're talking about." Fine. Just forget about it. But you're playing around to see what you can find, what does make sense. And it's quite arbitrary. It's not that there's right and there's wrong. We're just playing about.

Actually, there's another one I didn't include in the script, but I should add: rhythm. Isn't there a rhythm to the movement? And that comes from the same place—a long-time student who said, "I've discovered the rhythm of the breath, and then I could stay with it."

But these are just illustrations of the creativity that you bring to this practice. For a start, what is the experience? How does it actually present to you? And what aspect of it can I connect with?

Which one is longest? Which one is shortest? That's a pretty obvious one, isn't it? Out long, in short. How many people would vote for a long out and a short in? How many people would vote the opposite—long in, short out?

So you notice that there's no one correct answer. There's never one correct answer. There is never one correct experience. There's what you are experiencing now. That's it. That's what's going on.

But yes, let's experiment further. Which one is clearest—in or out? Some find them pretty much the same, but with the in being so much longer than the out. The in was definitely longer than the out, but both equally clear.

Did you find beginnings and ends? Were they clear? How many people found a clear, distinct border to the end of the out-breath—like, this is the point that the out-breath ends? Some know it's the end, but it's kind of faded because it overlaps with the beginning of the in-breath. You know it's finished, but you can't actually pinpoint exactly when. It's not like a dot. It's more of a fade. What about the end of the in-breath? Is that a dot? So you can't quite pinpoint it—it's a continuous flow. We'll get back to that.

Is there a gap between out and in, a rest period? Anybody find the gap between the out and the in? This is fairly common. One of the things about the out-breath is apparently—and when I say these physiological things I'm really guessing because I just hear about them—but apparently the body relaxes on the out-breath. And what can easily happen when people are doing breathing meditation and they complain that they're falling asleep or getting really dull, usually, more often than not, it happens on the out-breath. The out-breath kind of fades away, and as the out-breath fades away, the mind fades away.

So that's something to look for if you are getting dull during breathing meditation. Check your relationship to the out-breath. Check to see if there is a gap between the out-breath and the in-breath. And what does the mind do during that gap? Is it staying sharp and alert? Or is it going out for a snack and coming back later on?

These are the sorts of things to check on.

When I talked about movements, and this is something that you raised, I said let's assume there are two movements—one for the in-breath, one for the out-breath. Is that correct? Are there two movements?

"You would debate that. It just happens."

Yes, I think that's a fairly common experience. And when that happens, it shows you that if you're going to space out during breathing meditation, you're more likely to space out on the out-breath.

"Can I also say that it's the place where I will stop breathing? On the out-breath. If something happens, I actually hold it from that point."

That's another interesting thing about breathing—the close relationship between the breathing and the emotional life, and how they interconnect.

"For me it was the two polar opposites. So it's the same movement, but one is going up, the other one is going down. So there's not two movements, there's actually one movement, but it just changes direction."

Correct. How many people would agree with that? It's actually one movement.

"I don't know. Three movements."

Three movements? So discrete, separate movements, each in and out?

"No, they're overlapped. But you could distinguish them."

Good. So again, this shows us the variety of experiences that people have. We assume that if you have a room full of people and they're given the instruction to be mindful of breathing, they're all doing the same thing. But actually they're not. They're doing different things, because the breathing—what we call breathing, quote-unquote—presents in different ways at different times to different people. And as meditators, what we want to do is clarify: how is it presenting to me now?

"Patrick, when you were having interviews with Dada, specifically around breathing, would he be asking questions around direction, or would you be expected to report on that?"

First of all, he emphasized rising and falling of the abdomen, and you had to report that. You just had to. So in that sense it was quite rigid. But within that, what he wanted to know was exactly this kind of detail. How long was it? What was clear? What was not clear? What bits were missing? What bits were not missing? So it was using the structure of the rising and falling of the abdomen, but using that to be really detailed and precise on what exactly is happening—not just, "Oh, you know, it goes up and down." That was not good enough.

And the precision is important. We talked about it yesterday, and it's the same thing here. If you're practicing for insight, if that's the project, well, how does insight arise? The Buddha says it arises through the perception of impermanence, through the perception of change.

If someone comes into an interview, for example, and let's say they're using breathing as a meditation object, and I say, "How is it?" and they say, "Oh, it's really boring. This is really boring." And I say, "How is it boring?" And they say, "I'm sitting there breathing in, out, in, out, all day long." Now, do they get my sympathy? No. I say, "Well, obviously, you are not paying attention."

Because if you were paying attention, it would not be the same. This is really basic for this style of practice.

So we're generating accuracy and precision, but we're doing it because we want to see change. And the more accurate you are, the more change will present itself. Therefore, the more detail you can present in an interview. And if you're presenting detail in an interview, then the teacher can think, okay, they're seeing change.

Now, what detail is being presented is usually completely irrelevant. It really doesn't matter. But the fact that there is detail means the person is seeing change—that this breath is not the same as that breath. But if this breath is the same as that breath, that's the perception of permanence, nicca-saññā. And for the Buddha, the human condition of delusion is built upon nicca-saññā, the perception of sameness. The perception of self is built upon the perception of sameness, for example. You can't have a sense of self unless you're sitting there having this discussion, absolutely convinced that the person sitting here having this discussion is exactly the same person who turned up here a few days ago. If you don't believe that, you can't have a self.

So the perception of change is really important. And what the method is doing is getting an entry into that by using detail and precision.

Anybody find they were interfering with the breathing? Why were you doing that? Anxiety and breathing—closely linked. A psychologist and long-time meditator, a friend of mine, when he teaches meditation, strongly recommends that people suffering from anxiety should not use breathing as a meditation object. They should just not use it. It's not suitable. I'm not a psychologist, so I'm not in a position to comment, but anxiety and focusing on breathing can be very close.

The relationship to breathing is very important because it's very easy to reach out and try to control it—especially when it's a meditation object, and especially when it's an important meditation object. Because we're projecting all this importance onto it. And it's got to perform. If it's not performing, how can I succeed in my meditation practice? So it's an open invitation to anxiety.

Getting a sense of whether you're interfering with the breathing or not is quite important for a lot of people. And if you feel that you are, drop it. And as you just told us, you discovered a way that you could drop it—just anchor and let the breathing do whatever it does. What I'm actually doing is allowing us to sit still and be aware of what's actually happening, to see where it's coming from.

For this reason, breathing is not suitable as a grounding object for a certain proportion of the population. Very good as a secondary object, but not necessarily good as a grounding object. One thing to watch is that it is very easy to interfere with the breathing, so that's one thing to be wary of.

Although, again, as an illustration of the variety of experience—one time I was having this discussion in a practice workshop, and one of the meditators objected. She said, "How can I tell if I'm interfering with the breathing if the only time I know what it's doing is when I'm looking at it? So how can I tell whether that's interference or not?" And I thought, this person should be a lawyer.

This is a really good objection. I find it's a bit like that idea in quantum physics—that if something is observed, it's going to change automatically. So I do think even just being aware of the breath is affecting it somewhat.

This is something that's worthy of attention, but simply watch for it. If you find yourself getting into that sense of clinging or strain or grabbing, then step back, drop it, relax, and just be aware. You might find yourself extending the breath because you're trying really hard to pay attention. This is one of the problems with precision, particularly with the breath—you can interfere with it.

I think during my meditation boot camp in Burma, one of the things I did was, over time, create my "meditation breath." And then it took years to drop it afterwards when it was just getting in the way. But this is part of the broader issue: how can I be aware of something without interfering with it? Just simply be aware of it. And it's very, very delicate.

So don't be perfectionistic, but when you see a problem emerge, be aware of the problem and then step back. See what happens. This process is experimental. And we never get to a full conclusion, because the experience itself is constantly changing. But be playful with it. Don't take anything for granted. Just see what it is now.

So, your mission, should you choose to accept it, is to go forth and breathe. Be aware. And see what happens as a result.

Some traditions link breathing with walking meditation—one breath, one step, that sort of thing. For me that makes it far too complicated, so I don't do that; I just do the walking. But as you do the walking, what can happen is the breathing becomes very clear, and sometimes breathing and movement spontaneously interconnect. You find a distinct breathing pattern associated with a distinct moving pattern. That can definitely happen, so breathing can become part of the moving meditation. But you don't have to make it be part of the moving meditation.

When you find the breath comforting, that sounds good. It's positive because it means there's less resistance and less likelihood of getting tangled up. It helps the serenity if it's comfortable. And that's good.

Thank you very much.

CHAPTER 37

Mindfulness with Breathing

Patrick Kearney · 47 min

In this evening talk from the 28-day Satipaṭṭhāna retreat, Patrick Kearney offers a careful reading of the Buddha's condensed instructions on ānāpānasati (mindfulness with breathing), drawing particularly from the Ānāpānasati Sutta. He emphasizes that these ancient teachings function as an 'executive summary' to be used creatively rather than applied literally, and explores the progressive stages the Buddha outlines: from simple mindful breathing, to understanding (pajānāti), to deliberate training (sikkhati).

Kearney illuminates a crucial distinction often missed by practitioners: the practice is about mindfulness, not about breathing. He references Ajahn Buddhadāsa's translation of ānāpānasati as 'mindfulness with breathing' rather than 'of breathing' to highlight this shift in emphasis. When we project excessive importance onto the breath itself, trying to make it 'spiritual' or worrying whether it's 'good enough,' we create the very obstacles that block our practice. The talk explores how this misplaced focus strengthens the sense of subject-object duality—the self as someone separate from experience who seeks results.

The teaching traces a journey into increasing intimacy with experience, where breathing eventually transmutes into vāyodhātu (air element) extending throughout and beyond the body. This intimacy is conveyed through the verb paṭisaṃvedati—to feel or sense—suggesting direct touching of experience rather than distant observation. As concepts about breathing fall away and the body construction (kāya saṅkhāra) calms, practitioners discover the interplay of serenity and insight that characterizes the Buddha's path. Kearney situates this practice within kāyagatā sati (mindfulness immersed in body), emphasizing the Buddha's view that we are sentient bodies, not souls trapped within physical forms.

This morning we looked at mindfulness of breathing as a practical meditation exercise, and in particular at a style of mindfulness of breathing which suits the Insight Project. Tonight we're going to examine the Buddha's instructions on mindfulness of breathing.

These instructions are very brief. They represent a kind of idealised template of the practice, not something to be taken literally as "I must do this and in this order." It's more like an executive summary—we can be guided by it but use it creatively. This is actually true of a lot of the suttas, because they're so dense, so brief. You tend to get tangled up in knots if you take everything to be absolutely literal and to be applied to every person and every situation.

The Buddha begins: "Here a practitioner goes into a forest or to the root of a tree or to an empty residence, sits down, crosses her legs, straightens her back, and establishes her mindfulness directly."

This is a standard sentence that introduces whenever the Buddha is talking about formal meditation practice. Notice that the first thing to do is find the right place in which to practice. For him, it's pretty obvious that the correct place to practice is the forest. So what are we doing here? There's lots of forest out there. But if you can't find a forest, then find a tree. Actually, there is a big tree out there that sometimes people use for that very purpose. And if you can't find a tree, then one could use an empty residence or an empty place.

Notice that "empty" does not necessarily mean that no one else is around. It can also mean that it is empty of any purpose other than the meditation practice. So this hall is an empty place or an empty residence. If you have a corner in your house set aside for meditation practice, that's an empty place. First find the right place.

Second, establish posture. As we have mentioned, meditation is a physical activity. We tend to see it as spiritual, I think partly because in the European tradition we inherit an understanding that sees the essence of a person, their soul, to be somehow radically separate from their body. This understanding is traditional to Europe but completely alien to the Buddha.

From the Buddha's perspective, we are bodies. We are not souls trapped inside a body. We are bodies. We are sentient bodies—bodies that are aware, but bodies. Ānāpānasati is part of mindfulness immersed in body, kāyagatā sati. It's one aspect of mindfulness of body. Our connection with our sentient body is central in this practice, and one way that we get in tune with it is through posture. The body is always in a posture. As the Buddha says, there are four postures: moving, standing, sitting, lying down. The posture is how the sentient body expresses its inner nature, its inner structure, as it is now.

To establish a posture is to settle body and mind into their natural state. When the body is balanced, it's easier for the mind to become balanced.

First we find the right place, then we establish posture, and then finally we establish mindfulness directly. The language the Buddha uses and the similes he employs to talk about mindfulness are always very earthy. When he says "establish mindfulness directly," he's talking about the directness or groundedness that characterises mindfulness. We plant ourselves in a meditation posture and directly confront the reality of our

physical situation. For example, it hurts. We also, within this posture, directly confront our own minds. Our mind might feel trapped in this posture, might feel uncomfortable, might want to get out of here.

We establish mindfulness directly through posture. We plant ourselves into this position, and then we're ready to confront what's going on—perhaps through a chosen meditation object. In this case, the breathing.

Find the right place, establish posture, and within that posture establish mindfulness directly, confronting the reality of body and mind.

And then the Buddha goes on describing the practitioner. This is typical of the Buddha when he's talking about meditation practice. Often what he will do is describe someone doing it, rather than give an abstract definition. He says, "Mindfully she breathes in, mindfully she breathes out." So establish the posture and then find the movements that indicate breathing and breathe mindfully.

So far it's all very simple, very basic, very natural. For starters, we are already breathing. We don't have to do anything extra in this practice. The only difference is that we are now breathing with mindfulness, which means we are remembering the breathing.

We are already breathing. But do we know we are breathing? Not know intellectually, but are we directly experiencing breathing? Can we remember that we are already breathing? Can we notice our tendency to forget our breathing? All of this is bound up with mindfulness. The key here is the mindfulness, and mindfulness is sustained awareness, the felt continuity of awareness over time.

Perhaps this point might be useful to remind ourselves that mindfulness of breathing is not about breathing. It's about mindfulness. What we translate as mindfulness of breathing, ānāpānasati, is a compound. Sati is mindfulness, ānāpāna is in and out breathing. Grammatically there are different possibilities of how you connect those two words when you create a compound. Traditionally it's regarded as "of." Ajahn Buddhadasa of Thailand translated it as "with"—mindfulness with breathing. Notice how this gives it a whole different flavour. It shifts the emphasis and makes it clear it's not about the breathing. It's about the mindfulness. It's about our relationship with breathing.

A mistake we can easily make is to assume that mindfulness of breathing, or with breathing, is about breathing. In other words, we can assume that what we're being asked to do is something special with our breathing—for example, to make it more spiritual. This attitude often results in problems.

One thing that can happen is that I might find awareness being sucked into the breathing, with the breathing becoming increasingly distorted. Over time, this can be accompanied by a sense of claustrophobia and tightness. Sometimes the breathing really becomes very strong, stronger than necessary. This happens because when I focus deliberately, it's easy to interfere with the breathing by breathing deliberately. This is why this morning we had that last exercise: Am I interfering with the breathing? Because it's a very common thing.

The effort I'm supposed to be making in this practice is the effort, the commitment, to remember my breathing. That effort, that commitment, is entirely in the mind. But it leaks out into the body and I find myself breathing deliberately, breathing with effort. I easily forget that I don't have to breathe deliberately—I have to attend deliberately. I have to aim my awareness deliberately.

In other words, if we're talking about mindfulness of breathing, I've forgotten the "mindfulness of" and I've got sucked into the breathing. I'm projecting into the breathing far more importance than it would normally have. Instead of just being what I'm already doing, it becomes something very special which I have to be careful about. Because I might do it wrong. And if I do it wrong, I can never be enlightened. I can never even get samādhi.

Have you ever had the experience when you're doing breathing meditation and you just think at the back of your mind, "This kind of breathing will never get me into concentration"? Have you ever had that feeling? And if we have that feeling, what are we doing? We're projecting an importance into the breathing. We think it's about the breathing. But it's not about the breathing. It's about the mindfulness.

And this brings us to something that we've already talked about here. We're now moving away from breathing specifically into awareness in general.

We've mentioned how the mind is structured when we practice meditation. What we're dealing with all of the time is awareness and its object. We could call this structure a dyad of awareness of X, where X is the meditation object.

Now this dyad is completely natural, it's just part of nature. And it's certainly not a problem, but it can become a problem when my conceptual mind starts working on this simple elemental dyad.

What I notice is that normally my interest and my concern lies in X. Every experience has the structure: awareness of X. Now in that structure, what do I think is important? It's X. That's what's important. What I am aware of is important. So if I'm thinking, what I'm thinking about is important. If I'm seeing, what I'm seeing is important. And so on.

When I'm wrapped up in what I am aware of, my background sense of the one who is experiencing all this—the one who is seeing, the one who is thinking—this grows stronger. And this sense of someone in the background who's actually experiencing this, this is what the Buddha calls the self: the one who is aware, the subject who's located just behind the awareness.

And so this natural partnership between awareness and its object—awareness of X—turns into a sense of subject-object duality. Me in here, the world out there.

Let's say, for example, I am working hard to focus on the object of my awareness. Let's say breathing. If I'm doing that, then I'm developing a sense, a concept, of what this object means to me—to the one who's doing the focusing. So if I'm mindful of breathing, I develop a sense of the one who is breathing, and the one who wants to get something from this extra activity of being mindful of breathing. And this creates all sorts of complications.

For example, is this breath good enough for my purpose in practicing mindfulness? Or do I have to discard it in favour of something better? I find myself judging and comparing. And in all of this, what I've done is I've lost the intimacy with breathing that I was born with.

But if I'm simply mindful of X, what am I doing? I'm keeping X in mind. And this implies opening into a wider field of awareness. When I'm mindful—in this case mindful of X, or mindful of breathing—my interest is not simply in X, in breathing. My interest is in my continuing awareness of X, my continuing awareness of breathing.

So if I'm thinking, I'm more interested in the activity of thinking than what I'm thinking about. If I'm seeing, I'm more interested in the activity of seeing than what I am seeing. I'm absorbed into the activity. And if I'm absorbed into the activity, I lose my preoccupation with the one who's doing the activity.

It's like when I'm absorbed in a game. If I'm playing a game and what I'm really concerned with is what the scoreboard says and who's going to win—and therefore who's going to lose—then my sense of myself as a player, separate from the game, gets very strong. And if it's a team sport, my teammates will be strongly tempted to dump me because I'm not playing very well at all.

But if I'm really absorbed in the activity, in the game, I lose my sense of being somehow separate from the game. And I lose my sense of someone who's looking for a result from the game. And this is awareness of X, mindfulness of X.

So it's about becoming intimate with the activity. And when I am intimate, I lose my sense of something to lose and something to gain. I drop the web of habitual concepts that stand between me and my life. There's just intimacy. And when we are intimate, mindfulness actually emerges.

So our relationship to breathing changes. When we're getting started on this, we may become interested in the quality of our awareness—not so much what the breath is doing, but what the awareness is doing. What is my relationship to breathing? Am I fighting the breathing?

Trying to pound it into submission and force it to do something else? Is the breath easy to find or difficult to find? Is the mind distracted or unified? We discover that breathing is part of a wider field of awareness and activity, and we learn to rest in that field.

Now this is an expansion of "mindfully she breathes in, mindfully she breathes out." The Buddha then says, "Breathing in a long breath, she understands she is breathing in a long breath. Breathing out a long breath, she understands she is breathing out a long breath. Breathing in a short breath, she understands she is breathing in a short breath. Breathing out a short breath, she understands she is breathing out a short breath."

Notice that the verb has changed here. There's breathing, but there's also understanding. This is the verb *pajanati*, from which we get *paññ̃a*—wisdom or understanding—and also *sampajaññ̃a*, clear understanding. The Buddha often links *sati* with *sampajaññ̃a*; often they appear as a compound. So what are we practicing? We're practicing *sati-sampajaññ̃a*, mindfulness and clear understanding.

As the practice develops, we're not just mindful of breathing but understanding breathing. The Buddha uses the shorthand of length—is it long or is it short?—but I think that's just shorthand for understanding all the varied characteristics of breathing when we start to explore it. This is what we were doing this morning.

What this suggests is what the Buddha calls *anupassanā*, tracking the breathing over time. We learn to remember the breathing. We learn to remember that we are already breathing. As we do that, the continuity of awareness becomes more apparent. As awareness becomes continuous, we see and understand more of the breathing and how it changes—and even what changes it. We begin to understand its conditionality.

In understanding, we're bringing intelligence to the mindfulness and to our relationship with breathing. We're interested in patterns, in how things unfold over a period of time, including the breathing.

Then the Buddha says, "She trains herself to breathe in, feeling the whole body. She trains herself to breathe out, feeling the whole body." Again we have a shift in the activity. From breathing, to breathing mindfully. From breathing mindfully, to understanding. From understanding, to training. This is from the verb *sikkhati*, to train.

A pattern is emerging—an increasing deliberation and sophistication in our relationship to the object of experience, to the meditation object. In this case, the breathing. From breathing to breathing mindfully, from breathing mindfully to understanding breathing, from understanding breathing to training breathing.

We start with just breathing. Breathing is natural; it just happens by itself. But when we start to practice mindfulness of breathing—or mindfulness with breathing—our relationship to the breathing becomes part of the picture. As understanding develops, our relationship becomes more sophisticated. We learn to see the patterns of breathing. We might see, for example, how the state of the body influences breathing, and how breathing influences the body. Or we might see how the state of the mind influences breathing, and how breathing influences the state of the mind.

Then training comes in. In training, what the Buddha is getting at is that we start to recognize the decisions we are making in maintaining awareness of breathing, mindfulness of breathing. It's a training. We're making choices along the way in order to get a certain result. We have a sense of direction to what we're doing. It's not just being aware of whatever is happening, but taking the practice in a chosen direction.

So for example, the mere fact that we've chosen to focus on breathing means we're already making a choice which is sending the awareness in a particular direction. And then even with breathing, we may choose to focus on breathing sensed in one specific part of the body. It might be the classic rising and falling of the abdomen. It might be the breath at the nostrils. It might be something else. Or we may choose to open up to the whole body and get a sense of movement of the air element throughout the whole body. Or we might make some other choice.

But in making these choices, we are deliberately moving along a path. We are developing a path, which means we have a sense of aim, a sense of direction. We're managing our relationship to breathing, or any other meditation object, in order to bring about a particular result. And here, according to the Buddha, the aim is to feel the whole body.

So let's get a sense of what this is all about. We'll be talking about feeling tomorrow morning, but in the relationship with breathing, we're becoming intimate with breathing. And this intimacy is conveyed by the verb *paṭisaṃvedati*, when the Buddha says, "She trains herself to breathe in or out, feeling the whole body." The verb is *paṭisaṃvedati*—to feel, to experience, to sense.

Now this is more than just awareness. What it's conveying is a felt intimacy. There's something going on in our relationship to breathing which is closer, more intimate, less cognitive than just awareness. Awareness itself, when we're aware of something, can have a sense of distance. It's like I'm aware of it from afar—I'm here, or my awareness is here, and the object of awareness is over there. Feeling suggests getting closer to the object, becoming intimate with it. It's like touch. When we touch something with the hand, we are intimately close to it. And the verb feeling, *paṭisaṃvedati*, conveys this sense of intimacy, directly touching our experience.

So we're not distant from our breathing. We're not separate from it. Awareness and breathing are intimately intertwined. And as intimacy develops, our concepts about breathing drop away. What we discover is its elemental aspect. So the object is no longer our concept of breathing, but what we've learned to call air element, *vāyodhātu*, or in other traditions, *prāṇa*, or in other traditions, *chi*.

Any ideas we have about breathing fall away, and all we have is the elemental quality of movement itself. And this changes the geography of the breathing. If I ask, "Where do I breathe?" well, the answer is in my lungs, and my lungs have a definite location within my body. But where do I find air element? I can find it anywhere in the body. I can find it throughout the body. I can find it extending beyond the body, because it is movement itself.

With this intimacy, any idea I have of where my breathing should be or what it should be doing no longer applies—it all drops away. In fact, any idea that I have of my breathing drops away, and I've entered into a different world. At this point, what we may find is that we open up to what the Buddha calls the whole body, *sabbakāya*. Where body, of course, is the experienced body. And this implies a complex network of felt elements, not the solid form that we suppose it to be. Even this whole body might extend way beyond the form that I see in a mirror. The familiar world of me, my body, and my breathing is falling away the more intimate I become with it.

Then the Buddha says, "She trains herself to breathe in, calming the body construction. She trains herself to breathe out, calming the body construction." Here we have a technical term: body construction. In Pali, this is *kāyasaṅkhāra*. So what is this all about?

Well, firstly, when the Buddha talks about body,

What he means is our experience of body. And secondly, construction or formation—sankhara—refers to the fact that all experienced events are constructed or conditioned by other events. And in turn, they construct or condition the next events. In other words, this introduces the Buddha's teaching of dependent arising.

So what forms or conditions or constructs our experience of body? Certainly one aspect is air element, the experience of movement. Let's take just one example. Have you ever felt relaxed and open to the world? If you have that experience, you notice that your body moves easily and your mind is sensitive and open. Have you ever felt defensive and threatened? You might have noticed that when you do, your body tightens and stiffens, and your mind becomes focused on a sense of threat felt in the body but conveyed by concepts.

When the air element moves easily and freely, the body is open. And when the body is open, the mind is relaxed and engaged with what's going on here and now. When the air element is blocked, the body is blocked. And when the body is blocked, the mind is tight and usually lost in a world of concept.

So calming the body formation refers to a state of peace and openness to the felt reality of the world. We're open to the direct experience of whatever is happening here and now, with no conceptual overlay and no defense mechanisms setting up layers of armor. We're simply here now. Everything calms and we're left with pure intimacy. And we've used the breathing as a vehicle to get there.

This is one possible reading of the Buddha's passage, because it's not the only one, obviously. If you look at how the Buddha's tradition is constructed, it's like having layers of teaching. At the bottom is what the tradition calls mula, the foundation—the Tipitaka, the discourses, the Vinaya, and also the Abhidhamma. These convey the words of the Buddha, and as I said, often the words of the Buddha are very compact. Then on top of that, you have atthakatha, which means explanation of the meaning—commentary. On top of that, you have the tika, the commentaries on the commentaries. On top of that, you have the anutika, the commentaries on the commentaries on the commentaries. And on top of that, you've got the dipani, the commentaries on the commentaries on the commentaries on the commentaries. So it starts to open up, and people play with it. What's being said here?

This is common to all the Indian traditions. What they do is play with it, and they play in particular with meaning. They play language games and draw out different meanings, and hence you have this huge variety of Buddhist traditions—because you have these different games that people have been playing with it, drawing out different meanings.

This is what we're doing in this retreat. So don't take whatever meaning I'm giving you too seriously. It's just my game, which I'm playing tonight, which may or may not be helpful. I hope it is helpful.

One way of looking at mindfulness with breathing or mindfulness of breathing is you can see it as a journey into the nature of experience, using breathing as the path. The journey is one of deeper and more refined awareness, which is another way of saying it's a journey into intimacy.

First of all, we bring awareness to what we normally take for granted and therefore don't notice—for example, breathing. Then we cultivate mindfulness. We train ourselves to remember our awareness, to maintain a felt continuity of awareness over time. Then we develop understanding. We learn the patterns of experiences, how the experiences come and go and under what conditions. In this case the breathing—we learn the patterns of breathing, what breathing does over time and how we respond to it. You could say we become interested in what breathing can teach us.

As our relationship to the meditation object changes—in this case the breathing—so too does the meditation object. As we change how we experience, we start to change what we experience. And so breathing ceases to be what we think it to be. We're getting beneath our concept of breathing, where breathing transmutes into vayodhatu, air element, that extends throughout the body and even beyond the body.

The relationship is becoming one of increasing intimacy—from just breathing, to being mindful of breathing, to understanding breathing, to the much more intimate feeling the breathing. And we take this intimacy to other aspects of experience. Finally, the felt openness and fluidity of the air element enables body and mind to calm, to become still and sensitive to whatever is arising in our experience.

The nature of mindfulness also changes. From just being mindful, which implies accepting whatever is happening, we move to training ourselves, which implies deliberately changing experience in order to move it in a different direction.

So we're not just uncovering what is happening, but we work to move it in a desired direction—toward, for example, the cultivation of serenity and insight.

Any questions?

Question: My question relates to the last point about moving the breath. Does this come later in the discourse? Sometimes you just get this little passage and that's it for the breathing, but there is the Ānāpānasati Sutta, and that goes into a lot more detail. It talks about the development of serenity and outlines a very particular path.

Response: Yes, these are sometimes called the sixteen steps of ānāpānasati. But here we've just looked at the executive summary only.

Follow-up: But still, the instruction seems kind of neutral—probably not the right word—but you mentioned calm. And calm has a positive sort of flavour to it.

Response: That will give rise to a sense of well-being. And that sense of well-being in turn opens and relaxes the body. And that in turn affects the mind, and so on. So the whole process rolls on.

When we talk about calm, we're talking about the development of serenity. And when we develop serenity, we can see more clearly what's going on inside. So these two go together.

One image that's used is like the two wings of a bird. Another image is this: let's say you go swimming in a deep pool, and you're just at the edge. You dive in and then swim around where you stopped, just underneath the surface. You're getting a certain view of what's going on. But let's say you climb onto a high diving board, you dive in, you go really deep, and then start swimming around. Well, you've got a very different view and a quite different experience.

The serenity represents the depth. And the swimming around having a look represents the insight. So they work together. If you want to have deep insight, you need a good foundation of serenity. And calm suggests that. But here we're not going into the detail.

Question: You talked about this process as a path, and we talked about lots of different meditation objects. I know you've said many times there's not a better one or a worse one, but are different meditation objects taking us along different paths?

Response: I think it's more the relationship to the meditation object. So there's not a hierarchy, there's not objectively better or worse meditation objects. But of course there are meditation objects that are better for this particular meditator at this particular time. So part of the training is working out what that is and then going with that one.

Follow-up: I think you mentioned the other day something about how if you're training your awareness on the breath at your nostrils, your experience can tend to be more disembodied than using the breath at your heart. So by our choice of meditation object, is that shaping the nature of the experience?

Response: The choice of the meditation object, the choice of the relationship to the meditation, the choice of what posture I'm meditating in—all of these shape experience.

In my Zen days, the emphasis was just following the breathing, or the koan, or the breath count, and it was always very specifically located. The retreat was structured with a lot of sitting and a little bit of walking. And the talk was always about concentration, concentration, concentration.

So that all adds up to a package of developing concentration rather than what the Buddha would call insight. The insight side was taken care of by the koans—a very different approach to insight. With that structure of meditation practice, you are sending your mind in a certain direction.

I've got a vivid example of that. I once had a brief talk with Christopher Titmuss. He was teaching a retreat and we didn't know each other. I was introducing my practice to him, saying, "I've got a question about whatever it was, and I've been practicing Zen for so many years."

The way he responded was, "Oh my God, not another! Look, it's not about concentration. It's not just about concentration."

I got the distinct impression that he had dealt with a lot of Zen practitioners and they were all banging on about their concentration. Which is fair enough, because I was about to bang on about my concentration. But the culture that you're trained in teaches you, "Well, this is what's important. This is what you should be talking about."

This is how you should be talking about it. Then you shift to another tradition, and it's something else that's important, another way of talking about it, something else that you should be doing. So that sends the experience off in another direction.

Which is one of the reasons why it's important to find the right tradition—which for me essentially means finding the place where you feel at home, where it feels natural, and then going with that. But it's also another reason why people might, after a long time working in a particular tradition or lineage, change to another one. Because they feel, "I need an alternative look, I need an alternative view of what's going on."

When you talk to mature practitioners of pretty much any tradition, what you find is a commonality in their understanding and experience. There can be quite different ways in which they express it, the ways they talk about it. I have some Zen students and even Zen teachers who do my retreats. When I'm listening to a question from them or engaging in an interview, sometimes I've really got to focus to work out what on earth they're talking about, because the language is so different. Are they talking about something that I talk about, but simply using different language? Or are they talking about something completely different? It's not so easy to figure that out. But when you get to know people, you can see that the end result in terms of how one's life changes—it's the same across traditions.

Many years ago when I was in India, I met a New Zealand Presbyterian minister who was wandering around in search of enlightenment. One constantly bumped into people wandering around India in search of enlightenment, but I'd never met a New Zealand Presbyterian minister doing this. We were having a talk about the different traditions, and he said the different religions or religious traditions are like silos—vertical structures. Most of it is just people who believe what they're told, go through the motions, and never really try to find out what it's about. And then at the top you have the practitioners, the meditators, the mystics, the yogis, who actually investigate: What is this about? What's going on?

If you line up these different traditions, what you often find is that the people at the top—the mystics, the yogis, the practitioners—have more in common with each other than they have with the people in their own tradition.

And I think he's right.

I asked him what he was going to do when he got back to Kiwiland. He said, "I don't think I'll get a job as a Presbyterian minister. I'll probably be a truck driver."

Thank you.

CHAPTER 38

Tracking Feeling (Workshop)

Patrick Kearney · 50 min

> *In this workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney introduces vedanā (feeling) as the second foundation of mindfulness, following the foundational work with body. Through a guided meditation experiment, participants explore the difference between watching the breath and feeling it—discovering how these represent distinct relationships to experience, with watching suggesting distance and objectivity, while feeling indicates intimacy and subjectivity.*
>
> *Kearney explains that vedanā represents the affective or hedonic aspect of experience—like the flavor of food that moves us to respond. Drawing on the Buddha's teaching of dependent arising (paṭicca samuppāda), he clarifies that contact conditions feeling inseparably, but feeling need not condition craving—making this the crucial point where ethical choice becomes possible. The Buddha's vocabulary reveals how cognitive terms (avidyā, bodhi) and affective terms (taṇhā, nibbāna) describe complementary aspects of both our fundamental problem and its resolution.*
>
> *A key practical insight emerges: don't look for vedanā, because it's already here. Like a historian who struggles to discover what was obvious to people in the past precisely because they never recorded it, meditators often miss what is most apparent because they're searching for something special or hidden. The teaching emphasizes starting with direct experience rather than concepts, using terms like vedanā as poetry rather than rigid scientific definitions—helpful maps that clarify experience without constraining it.*

Over the past few days we've been emphasizing the role of body in the meditation practice. The practice we're doing is called Satipaṭṭhāna, and there are four Satipaṭṭhānas. Body is the first one, and it's not listed first because of alphabetical order. It's listed first because it's foundational to the whole thing, to the whole enterprise.

But the second Satipaṭṭhāna is vedanā, or feeling. This is what we're going to play around with this morning, and we'll talk more about it tonight. So let's begin with a meditation experiment in vedanā. As you do this, play with it. Don't take it seriously. Don't think that there's a right or a wrong. Just experiment and see what happens.

Settle awareness in your body and construct your meditation posture. Be aware of the sensations at the base of your body. From there, lift up through your spine. Relax your shoulders and let your head come into balance.

Let yourself become aware of what is happening throughout your body. At the bottom is the hardness and stability of your contact at the base. Rising up from there is the lift and firmness of your spine. Around that frame there is a field of sensations coming and going.

Start to settle your awareness on the movement of inbreath and outbreath. Now watch the movements of your breathing. Look at your breathing. Witness your breathing.

And now feel your breathing. Do not watch it. Do not look at it. Do not witness it. Feel it. Feel your breathing. Feel the movements.

Bring your awareness back to your whole body. Open awareness out to include your whole body. And from there, feel your body and everything happening within it. Feel your body.

So, is there a difference between watching the breathing and feeling the breathing? And if there is, what is it?

"The texture. The texture of the breathing, the contact with the esophagus and the nostrils."

So you've got a sense of texture when you feel. Is that right? But you don't get that when you watch?

"Less."

Anyone else? Is there a difference?

"I find it very hard to do one without the other. So when I was watching, I realised that I was also feeling, and when I tried just to feel, I wasn't quite sure. Because they're always mixed up."

But they're distinct—you can tell the difference?

"Sometimes I do, but on this occasion I didn't feel something so strongly that I could separate it from watching."

But you do have a sense that it's twofold. There's watching and there's feeling, and that's normal.

"Yeah, so when I watch, I probably feel as well."

So I definitely feel something, but I can't do it without watching.

Yes, so you've got to have both at once. It's a package.

That's right. It's almost like I'm looking with my eyes. If I'm watching the breath in my nose, I feel like my eyes are looking at this place.

So there's a sense of the location from which you are aware, and this is associated with the eyes. I think that's actually quite a common experience.

Anyway, that's our little experiment. Some of you have done this before, and you're thinking, why do I have to do this again? The reason is because I just told you to. Because I'm in charge.

This is a way of introducing the whole subject of vedana, feeling. Vedana represents the affective or hedonic aspect of experience. The language that the Buddha uses can be quite precise. He's got a sophisticated technical vocabulary when he talks about experience.

One of the basic problems we have in understanding what the Buddha is talking about is that if you look at English and the range of words we have to talk about what happens in the mind, it's about this number of words. Usually people fall back on "thinking" as a kind of catch-all. If you look at the range of words that the Buddha has for describing what's going on in the mind, it's this big. He's got a considerable vocabulary. He's got many more words which are very precise than we have, which strongly suggests that we literally have no idea what he's talking about, because the concepts just aren't part of our culture.

So it can be quite challenging to actually work out what exactly he means when he uses a certain word. And especially since we're approaching it through translation, which is somebody else's interpretation.

The basic vocabulary that we use when talking about the Buddha's teaching comes from pioneer late nineteenth, early twentieth century English translators. Most of them were English gentlemen of the Victorian era who had absolutely no comprehension whatsoever about meditation practice. It was a complete mystery to them. You've got learned scholars who opined that meditation meant someone would sit down and commune with the devas, and the devas would give them messages, and this would be the teaching that would come out of meditation. This is the sort of rubbish that they actually wrote about. They had no comprehension.

Did any of them ever practice?

No, no, no. They were scholars. They didn't go native completely. I mean, it was scandalous enough that someone like T.W. Rhys Davids actually studied Pali in Sri Lanka, which got in the way of his administrative duties. But it was okay because the British did admire linguists. But they were just linguists. And they were proper, objective nineteenth century scholars.

If you look at the image presented by how these pioneers introduced the Buddha to the Victorian public, he was presented as the perfect Victorian gentleman. Why do we think that the Buddha was against the priesthood of the Brahmins? It's because if you're a good Protestant gentleman, you're against the Catholic priesthood. So obviously priests are bad. Why was Buddhism presented as the religion, quote-unquote, of rationality? Because if you're a Protestant Victorian gentleman, you think rationality is right up there. And if you're going to present these uncivilized, barbaric black people, these Indians, as kind of civilized, well, you said, well, they're quite rational. They actually had what we might call a philosophy.

So a lot of it was PR. But it was presenting the Buddha to a Victorian imperialist, largely Christian audience in a way that wasn't threatening to them. So a lot of the translations are very Victorian Christian. And they really don't get what the Buddha's talking about because they really didn't get this whole project.

Patrick, can you give some examples? You said we have so many words for thinking or mind that came out in the translations. Can you give a sense of what's been lost?

One of them is mañña and the verb mañña, which comes from a root meaning mind, but it's an action, and it's usually translated as "conceiving." What does that mean?

Not at the moment. When I was obsessed with this years ago, I could have rattled off a few words, but I've forgotten them. I'm getting far too old for this job.

So anyway, we've got vedana. Now vedana comes from the root *vid*, to sense, to feel. And you get a whole number of words that come out of this. For example, the Vedas come out of this root. But the way the Buddha uses it, when he uses words based on this root, what's being suggested is intimacy—a close encounter with the experience.

So for example, last night we were talking about feeling, in terms of breathing, feeling the whole body. *Patisanvedati*. That's a word based on this root. So it suggests intimacy, getting closer. In contrast, with words based on the root *pas*, to see—like vipassana, insight—these words suggest distance and detachment and objectivity. So words based on *vid* suggest more of a subjective relationship, while words based on *pas* suggest a more objective relationship.

Now, vedana is translated as feeling, which I think is quite reasonably good, except people mix it up with emotion. People often think vedana has something to do with emotion. Well, it's connected with emotion, but it's not emotion. But like the English word feeling, vedana can indicate both what we experience and a way of experiencing.

So in English, we talk about feeling as a noun. "When you said that, you hurt my feelings." "You're taking no account of my feelings about this." Here we have feeling as a noun, but we also have it as a verb, as a way of experiencing. So you might say, "Well, I think that's a good idea, but I can't help but feel that it would be a disaster." Now that makes sense in English, doesn't it? If somebody says that, you know what they're talking about. So there, vedana is not a something, but a way of experiencing. Not something which is experienced, but a way of experiencing. And that, of course, was what we were doing in this little experiment—seeing if we could get in touch with that.

Now, feeling, of course, is very important. I've probably told you this story, but one of my profound realizations in the course of this practice occurred years ago. The first time I was living in Brisbane, I was on a bus. I lived in West End, heading down Boundary Street. I don't know how familiar you are with Brisbane geography, but at the bottom of Boundary Street is a pub. Which in those days was a working class pub. Now it's been all yuppified. And the bus stopped very close to the pub. And this old bloke got on the bus.

Well, at my age then, he was old. He was younger than I am now. He seemed to be about mid-sixties, I would say. Very overweight. Very stiff. Dressed in the Queensland working class uniform—singlet and shorts. Skin damaged by decades in the sun. And you take one look at him and you think, okay, this is an example of the body shaped, conditioned by decades of spending all day working, labouring in the hot sun, and every evening at the pub, downing as many beers as you can get hold of.

So he gets on the bus and he kind of staggers down the centre and sits behind me. On the window seat, there was another old codger who was sitting there, and they knew each other. And the bloke who was already sitting there said to this new arrival, "G'day Bill, how are you feeling?" And Bill replied, "Buggered if I know, mate."

And in that moment, I realized that Bill was actually a bodhisattva who had descended from the heavens to give me a teaching which I really needed to learn. Which was: if you don't know how you're feeling, as a practitioner, you're in trouble. You've really got to know how you feel. And this is the realm of vedana.

Now, if we want to understand what vedanā is about, we could compare it to flavour. When we eat, we experience the physical sensations of the food—like the elements we've been talking about and playing with: hardness, softness, wetness, dryness, and so on. But we also experience the flavour of the food. And the flavour is not the sensations, though it's intimately connected with them. It's distinct from them.

Generally speaking, it's the flavour that moves us. It's the flavour that provokes a response. "Oh, I like that—I'll take more." "Oh, I don't like that one—I'll just pass it by." If we register the flavour as pleasant, we're moved to take more. If we register the flavour as unpleasant, we're moved to take less. And if we can't find any flavour, we're moved to indifference. But what moves us, what stimulates a response, is the flavour.

Vedanā is like the flavour of experience, which means it's an aspect of affect—where affect is that which has the capacity to move us. We might say of something, "That was very moving," or "I was moved by what you said." What we're saying is that there was a response. Where you have vedanā, feeling, you have a response. It's always the case. It's always built in.

The Buddha says there are three basic categories of response, and therefore three basic categories of feeling. Pleasant feeling moves us to reach out and to hold on. Painful or unpleasant feeling moves us to resist or reject the experience, to distance ourselves or defend ourselves. And finally, when we don't know what we are feeling—when the feeling is neither painful nor pleasant—we move to ignore it. We just don't notice it. Or, if we do notice it, we move to dullness, doubt, and confusion. "What do I do about it? Do I take hold of it? Or reject it? Or what?" But in every situation, we are moved.

In his teaching on dependent arising, the Buddha says contact conditions feeling. Contact refers to the immediacy of experience, and what he's saying is that where there's contact, where there's experience, there is feeling.

This relationship is very, very tight. He's not saying that there's contact, there's experience, and then later on feeling joins the party. He's saying that in the moment of experience there is already feeling. And there's always feeling. There's never an instance where there's not feeling. It's locked in. This suggests that experience comes to us already affect-laden. In other words, we are already moved by the experience. We are already responding to what is happening.

The Buddha says contact conditions feeling, and then he says feeling conditions craving. Now this relationship is different. If you've got contact, you have feeling—there's no possibility otherwise. Even a Buddha, if he has contact, he has feeling. But if you have feeling, you don't necessarily have craving. If there's craving, that craving arose from feeling. But you can have feeling without the craving.

And this is one of the reasons why feeling is considered so important, because it's at that point where we respond, where we have a choice. This is the area of particular interest in the Buddha's ethics. This is where we can make a difference. But in every case, we are feeling, we are mood.

So when we come to do the practice, what we're doing is experiencing body and mind. And how do we experience, for example, body? I remember when I started doing meditation practice, the instructions, whether verbal or in books, were invariably "watch the meditation object." Watch, for example, the body. Sometimes in the non-dual traditions they talk about the witness—be the witness of whatever is happening.

But what about feeling life rather than watching it? What about feeling the breathing rather than watching it?

We could say that watching the breathing creates a relationship to the meditation object that emphasizes awareness, consciousness, what the Buddha calls vijñāna. Feeling the meditation object, feeling the breath, is a relationship that emphasizes feeling. So there are different relationships that we can have when we approach meditation.

Some people find that their natural way of working with an experience is watching. Other people find that it's actually feeling. And other people have both. For some people, if they're watching the experience in meditation, this indicates a degree of distance, a separation from the meditation object, while feeling indicates getting closer to it. For some people, watching is more objective, while feeling is more subjective.

For some people—and these are just reports that people have given over the years—watching is more specific and more detailed. So when we're doing all the detail of the breathing, that would be a relationship probably of watching, while feeling tends to be more general. For some people, the experience of feeling the meditation object is very clean but very difficult to communicate, whereas the experience of watching may not be that clean but is easier to communicate. So if you're reporting an experience in a meditation interview, the tendency is to report what you watch, what you see, as opposed to what you feel.

For some people, with breathing, if they watch it, they experience breathing in one part of the body; if they feel it, they experience it in another part. For some people, if they watch the breath, it naturally echoes at the nostrils, where the breath is less embodied. But when they feel the breath, it naturally brings the awareness down into the body.

Now these are just experiences that occur to some meditators, not everyone. For some people there is a very clear distinction between watching and feeling. For some people, these distinctions make absolutely no sense whatsoever. They go through this learned disquisition and look at me and say, "What the hell are you talking about?" There's always a certain proportion of the population who have that response, because the distinctions just don't make any sense in terms of their actual experience.

A student asks whether this relates to citta, the definition of heart and mind. We're going to get onto that, but citta includes both the affective and the cognitive. In our culture we tend to emphasize the cognitive—like the use of the word "mind" for citta. If you're meditating, you're training the mind. But of course you're training the heart as well. Cognitive and affective—these two sides.

This also comes out in the way the Buddha uses language. When the Buddha is talking about what he sees as the fundamental problem that we have, sometimes he'll use cognitive language. The fundamental problem is avidyā—ignorance, delusion. You notice that's cognitive. Sometimes he'll say the fundamental problem we have is craving. Where is that? That's in the heart. That's affective.

When he's talking about what's the ultimate solution to the problem, sometimes he'll use a common term. The ultimate solution to the problem is bodhi, literally awakening.

Classically translated as "enlightenment"—which is cognitive. By the way, why did Rhys Davids choose "enlightenment" to translate bodhi? Because it was referring to the European Enlightenment. So it gets a big tick from the Victorians. That's why we use the term enlightenment, although it means awakening.

So bodhi is cognitive. And sometimes what the Buddha says is that the ultimate solution to the problem is nibbāna. And nibbāna is an affective term. It's a heart experience.

Now, when I say bodhi is cognitive, I don't mean it's a cognitive phenomenon—I mean it's a cognitive word, a concept. They're different sides of the same coin, but they're quite distinct. Awakening is cognitive: it's like I can see what's going on, I understand what's going on. Nibbāna is affective, of the heart. It's the cooling of the heart.

Now, they go together. Let's say I finally recognize what's going on, and because of that I calm down. Or it could work the opposite way: the heart calms down and now I can finally see what's going on. It wouldn't be "I see what's happening and I'm furious about it"—that wouldn't be nibbāna, would it? So these are the two sides of the human being.

We're talking about vedanā, feeling, which represents a different relationship to experience—quite distinct from watching, usually indicating intimacy and subjectivity. And of course we've got words based on watching: vipassanā, insight, and so on.

Now, as we said, the Buddha uses a whole range of quite sophisticated technical terms to analyze and describe experience. But these words are not science. They're more poetry than they are science. What I'm suggesting by that is not that these terms have a single objectively correct meaning that we are supposed to identify in our experience. And it's not that there exists a single objectively correct experience and an objectively correct practice to get to that objectively correct experience. Experience is much more untidy than our concepts about experience.

It's really interesting, I find, to look closely at what the Buddha is saying and try to sort it out. But it is possible to get too caught up in the meanings of the terms and miss what's actually going on. So don't get caught up in concepts like watching and feeling. Words and concepts are just ways of reading our experience. They're just names. They're names of something, perhaps, that we need to discover. Or they're names of things we have already discovered but just haven't yet named.

So if you're taking on the job of tracking vedanā, using vedanā as a meditation object—or anything else, for that matter—we start with the experience, and from there we interpret it. I'm aware of this. Could this be vedanā? What we do not do is start with the interpretation and from there look for the experience: "Where is vedanā?" Always ground yourself on the experience. But at some point we have to read the experience. We have to interpret it. We have to understand it. And that's where we bring in these terms.

So if you find that a term helps you understand the experience, that's good. It clarifies the experience for you. But it's not that there's only one meaning. Again, it's like poetry. A good poet is very precise in their language, yet different people can quite legitimately get different meanings from the same poem. And I think the Dharma is like that. It's more like poetry than science.

What we're doing in this practice is seeking to directly encounter what is already here, already available. But if we have a map of the area, then we can put our experience into a context. And that, apart from anything else, gives us a way of communicating experience with others. So don't look for something to match the concept. But rather, if we understand the concept, then we'll recognize it if we experience it. The concepts are useful, but don't get caught up in them. This is a danger with this kind of talk where we're going on about subtle conceptual distinctions.

One student shared an example of this complexity. He was out doing a bushwalk and saw a butterfly come by. Normally when he sees a butterfly, there's an automatic response of "oh, lovely." But this time there was an automatic kind of aversion, which he interpreted with interest—"that's weird, why am I responding this way?" All this happened very quickly. And at the same time, what he saw in the colors of the butterfly reminded him of a German Shepherd. It was the same colors on the butterfly. As a child, his cousins had German Shepherds, and he was always scared of them. One day the German Shepherd broke through a rabbit cage and devoured his rabbit in front of him. So there was this interesting discovery—normally the vedana toward a butterfly would be "I like this, I want more of it." But in this case, something else happened.

Experience is always complex. And in this case, perception got in the way, because the perception wasn't "oh, that's a butterfly." The perception was "that's a German Shepherd." Change the perception, you change the affective response. And this is one of the things that we discover in the practice—how our experience is conditioned by so many different aspects, that what we take to be solid and real is just this network of conditions. And it's not so solid as we thought it was.

So if you want to, if you're interested, you could make vedana your meditation object, play around with it. What we did this morning in the experiment was feeling rather than watching. If that was interesting to you, you could explore it further. If it's not interesting to you, forget about it. Don't worry about it.

Usually, certainly in the Burmese traditions, they emphasize experiencing vedana within the body. And they do this because the contact, the phassa, the direct experience of body, of touch sensation, is stronger and clearer than in other senses. So the vedana tends to be stronger and clearer.

One piece of advice I came across in Burma was from a book about an insight method that's very popular in Mandalay and that area, but has never been exported. They have vedana as their grounding object. Reading this introduction to the meditation method, one of the pieces of advice the author gave was: do not look for vedana. And the reason is, don't look for it because it's already here. We can miss it precisely be-

cause we're so busy looking for it, thinking it must be something special, and it must be hidden—that's why we haven't come across it yet. But it's already here, and it's already obvious. So it's a question of not looking for anything, but feeling what's already here.

And this brings us to one interesting aspect about meditation practice: often the hardest thing to find is the most obvious.

This was clarified for me years ago. I was reading a book on the history wars in Australia—the black armband versus the white blindfold approaches to Australian history. There was a quote from Geoffrey Blainey in which he talked about what the job of the historian is. He said the job of the historian is to look at the records left by people in the past in order to work out what was going on at that time. And if you're engaged in that project, the most difficult thing to discover is what was bleeding obvious to those people. The reason is because we never record what is bleeding obvious. Why would we? It's bleeding obvious. So we don't write it down. We don't record it. If you're coming at it later on, as a historian, that's the most difficult thing to pick up.

I realized the same applies to meditation practice. What's most difficult to find is what is most obvious. Because it's so obvious, so habitual, we overlook it. We assume that we're looking for something special, something spiritual, something Buddhist-y. We assume we don't know. And we assume that whatever it is we're looking for must be located somewhere else, and we've got to go hunting for it. But what we're looking for is already obvious, and it's already here. So don't look anywhere else. Just recognize what's already here. This can be helpful advice if we're working with vedanā, because vedanā is already here.

Someone asked whether this might also be connected to the Buddha's understanding that we are fundamentally bodies—sentient bodies—and that everything is in the body. Definitely, that's where the whole game is. And particularly with insight meditation, that's one reason why body is the first satipaṭṭhāna. Because this is where it happens. This is where the whole project unfolds.

There's an expression that you come across in the Buddha's teaching about experiencing enlightenment *kāyena*—with the body, in the literal translation. Now this is controversial. There are some people who say it shouldn't be translated literally as "with the body," that it should be translated as something like "experientially" or "personally," that it doesn't really mean the body. I can't help but suspect that if the Buddha said it, he meant it. Everything happens in the body.

Of course, as you refine the body, becoming aware of increasingly subtle aspects, what you're left with is what's called the mental body, the mind body. So the concept of body goes deeper than our normal anatomical concept. People do have experiences that seem completely disembodied. But as a general principle, it's the relationship to the body which is absolutely central, and which gives you your entry in. Once you're in there, you might find experiences that seem to have nothing to do with body, quote-unquote. But how did you get there?

Someone asked how this links with the Dhammapada, where the Buddha talks about the mind leading. In the Dhammapada, mind is the chief, mind is the leader. But where is mind? It's indissolubly linked with the body. If there's a mind, there's a body. And if there's a living body, there's a mind. This is part of why sometimes the Buddha uses the term nāma-rūpa to emphasize this mind-body integration—that where you have one, you have the other.

You cannot have the experience of body without mind, because you cannot have any experience without mind. But equally, you cannot have mind unless it's located in a body. Even in the deva realms, according to the Buddha, beings have bodies—more subtle bodies, but bodies nonetheless. So it's always interconnected. The term we use for mind in this context is mano, which is mind as a sense sensitivity, the sixth sense. What mind does in this capacity is absorb all the data of the physical world through the five physical senses, plus its own forms of data—perceptions, thoughts, memories—and bring all of this together to create the sense of "me in my world." So it works together with the physical world.

There's a related question about teachers who say that no effort is required, that realization is already here. This touches on the whole issue of dealing with what is already present. Certain aspects of dharma teachings emphasize this—that what we're looking for is already here. We simply don't recognize it. We think of ourselves as being over here while what we're looking for is over there, and somehow we must make a journey to reach it.

The Buddha does speak in those terms. The idea of a path, for example—a path from here to there. But the flip side of this is the intimacy that what we're looking for is actually already happening.

Consider insight practice. What do you want to see and understand? The three universal characteristics: anicca, dukkha, anatta—impermanence, suffering, not-self. There's a clue in the name: they're universal. They're already here. There has never

been a moment in our lives when we have not been intimate with anicca, dukkha, and anatta. They're built into the very fabric of experience. It's simply a question of noticing. We tend not to notice because we're so busy doing something else.

In traditions that call themselves non-dual, this recognition is emphasized more. In Theravada, it's emphasized less. But you do find this stream—the recognition that what I'm looking for is already here, already available. If I'm pushing beyond what's already here to get to something else, that's when I trip up. That's when I tend to make too much effort, or misdirect my effort.

But when I start practice, this pushing is inevitably what I do. It's only gradually, over time, as sensitivity develops, that I begin to recognize: it's already here. And often when we have some kind of realization experience, we can feel that we've simply stumbled into what has always been available to us—but now we're noticing it.

CHAPTER 39

The Ocean of Affect

Patrick Kearney · 48 min

> *In this profound exploration of the second foundation of mindfulness, Patrick Kearney illuminates vedanā (feeling) as far more than mere emotion—it is the affective ocean in which we live, as fundamental and often as unnoticed as the air we breathe. Drawing from the Cūḷavedalla Sutta (MN 44), taught by the arahant bhikkhunī Dhammadinnā, Kearney examines how feeling represents a way of experiencing rather than simply an object of experience. Contact (phassa) conditions feeling, and this relationship is as intimate as stimulus and response—where there is touch, there is already movement toward holding, rejecting, or confusion.*
>
> *Kearney connects vedanā to the Buddha's understanding of sentience and ethics, explaining that sentient beings are defined by their capacity to feel pain, which places them within our circle of ethical concern. He explores why meditation is so easy to postpone—because sitting exposes us to the pervasive unease underlying experience, the vulnerability inherent in being a feeling body bombarded by sense stimuli. Our habitual retreat into conceptual thinking serves as refuge from this felt reality.*
>
> *For practitioners, Kearney offers guidance on working with feeling through intimacy rather than cognitive clarity, surrendering into experience rather than analyzing it. He addresses the mysterious third category of feeling—neither painful nor pleasant—which he interprets not as neutral but as 'I don't know,' the ground from which ignorance (moha) arises. As practice matures, genuinely neutral feeling emerges, characterized paradoxically as more pleasant than pleasant, representing the equanimity of one who lives independently, not clinging to anything in the world.*

This morning we played around with, experimented with, and discussed vedana, feeling. Tonight we're going to talk about it in a bit more depth. The name of the talk is "The Ocean of Affect."

We start with this concept of vedana, usually translated as feeling, and what it refers to is the affective aspect of experience, where affect is that which has the power to move us, to stimulate a response. Vedana, or feeling, moves us to respond to what is happening.

We compared feeling to flavour—the flavour of food, not the physical sensations that we experience when we eat, but the flavour which is inevitably bound up with those sensations. Generally it's the flavour that moves us to take more or to have less.

The Buddha says there are three categories of feeling, and each one has its characteristic movement, its characteristic response. Pleasant feeling moves us to reach out and hold, to come closer and embrace. Painful feeling moves us to resist or to reject, to distance ourselves or to defend ourselves. But of course, sometimes we do not know what we are feeling, and then feeling is neither painful nor pleasant. This is the third category. When we recognize that feeling, we are moved either to ignore the event because it's not worthy of notice, or we move to dullness, doubt, and confusion in terms of what to do about it. But whatever the category of feeling, we are moved. We do respond.

I like the English word "feeling" very much. It can refer both to what we experience, as when we talk about someone's feelings, but it's also a way of experiencing things, as when we might speak about feeling our way forward. Tonight we're mostly concerned with this second aspect: feeling as a way of experiencing.

The first thing to recognize is that feeling is absolutely fundamental to our existence. If you look at our physical world, we live on the floor of a vast ocean composed of air. We are so dependent on this ocean that if we're separated from it, even for a brief period of time, we would die. This means that air is the most powerful and the most obvious aspect of existence, unforgettable in any circumstances. But as we all know, in fact we tend to ignore it completely. We notice it only when it disrupts our habitual functioning—when we smell it, or it seems particularly hot, or particularly cold, or we have trouble ingesting it. At other times, at most times, it completely disappears. We're not concerned with it at all. We don't even notice it.

This, by the way, reminds me of words of wisdom from my mother in my early adulthood. I told her that I was moving away from Sydney. She was born and raised in Sydney, and she was pretty horrified by a certain number of things I got up to, but this really hit her. Why would you leave Sydney? I said, well, it's so crowded and the air so polluted. She shook her head and said, "Never trust air you cannot see." I thought, this person has wisdom beyond my capacity.

Our psychological world is quite similar. We live in an ocean of affect, of feelings, and we tend not to notice it until it disturbs us in some way. Yet like air, it governs everything.

So let's have a look at feeling. First of all, where do we find feeling? The Buddha says the six sense fields condition contact; contact conditions feeling. The sense fields are the sensitivities that together constitute a sentient body. In Pali this is satviññanakaya. These sensitivities provide the location where all experience takes place. Where does experience actually happen? Well, it happens here, doesn't it? You probably think it happens out there somewhere, but it happens here. This is the location for experience.

Each of us is a locus of sensitivity surrounded by an ocean of stimuli. Sense data floods into the sentient body through the sensitivities of seeing, hearing, smelling, tasting, touching, minding. And each sensitivity is a receptivity.

to particular kinds of data. When the Buddha talks about the eye, for example, he's not referring to the physical organ as a doctor might. He's referring to the sensitivity of that part of our body which is receptive to light and colour. These are two little bits of the body that have that particular sensitivity. The sensitivity itself is what the Buddha calls "eye"—and so on through the physical senses. For him, mind is also a sensitivity. It's a sensitivity to non-physical data, such as thoughts, perceptions, concepts, and so on.

Each sensitivity picks up its own unique flow of data, and then all six streams come into the mind, where they're woven together to create a world. This is the world that we live in.

Depending on eye sensitivity and forms, visual awareness arises. The meeting of the three is contact. Contact conditions feeling. This applies to all six senses with the same analysis: depending on the sensitivity and the corresponding object, the corresponding awareness arises. Something is present. The meeting of the three is contact.

Contact is a coming together. Contact conditions feeling. As we've said this morning, contact translates the Pali word *phassa*, which literally means touch. The Buddha is saying that we are touched by what streams through the senses, and this touch is happening here and now. It is the immediacy of experience—the converging of the sensitivity, the sense object, and awareness. It's happening now.

Contact is like the arena of experience. It's the place where it happens, where everything intersects and comes together. Feeling is found in the response to experience. If I bring my hands together very gently and they touch, that touch is in a specific location. It's an event where something is happening. But as soon as there's touch, there's a response—warm, soft, pleasant—and there's just that little response of relaxation and opening in the body. That response is the feeling. The impact is contact. The response to that is feeling.

This relationship between contact and feeling, as we mentioned this morning, is particularly intimate. Contact and feeling are as close as stimulus and response. Where there is stimulus, there is already response. Where there is response, there is already stimulus. Stimulus and response, contact and feeling—they're different sides of the same coin. Contact is happening now, which means a response is happening now.

Let's look at one discourse where there's a discussion on feeling. It's very brief, from the Cūḷavedalla Sutta, "The Lesser Dialectic," in Majjhima Nikāya 44. The teaching is given by Dhammadinnā. She was an arahant bhikkhunī. I'm pretty sure she's the only woman who has her own sutta, her own discourse. The Buddha's teachings are the suttas—or in Sanskrit, sūtras—but sometimes a senior student would give a teaching, and the Buddha would hear about it. He might be present, or he might be told about it later, and he would give it the seal of approval, saying, "That's exactly what I would have said under those circumstances." Then that becomes a sutta. The Cūḷavedalla Sutta is the only sutta given by a woman, so Dhammadinnā must have been particularly important back in those early days.

This is what she says: "Whatever is felt physically or psychologically, as pleasant or soothing, is pleasant feeling."

Whatever is felt, physically or psychologically, as painful and hurting is painful feeling. Whatever is felt, physically or psychologically, as neither soothing nor hurting, is neither painful nor pleasant feeling.

This is her analysis. Again, you notice it's really brief. This is typical of the suttas—you've got to expand them to find out what's going on. But what she seems to be referring to when she's talking about feeling is the capacity of experience to soothe or to hurt. And this is what's central to vedanā, to feeling.

So as we've seen, feeling indicates a way of experiencing. She's saying that feeling is whatever is felt as pleasant or experienced as pleasant, felt as painful, experienced as painful. This "felt as," this "experiencing as," represents a form of understanding, of knowing. Because I know that it's pleasant. I know that it's painful. So there's an element of understanding. But this understanding is much more intimate than how we usually speak about understanding or knowing.

Let's say, in ordinary language, I say "I know something." If we say that, we are implying a subject-object distinction. There's a knower and there's what is known. And usually it's the I that knows and something which is known. Feeling implies a knowing which is much more intimate than that. And therefore it's less nameable. It can't quite

be pinned down as a something separate from the one who knows it. If I say "I know something," that something is what I am experiencing, what I know. But feeling doesn't really tell us what we are experiencing, but how we are responding.

So feeling is found in a response that moves us before we have had time to think about it. Contact conditions feeling. Later on comes perception, thought, and so on and so forth. So before we've had any time to think about it, there's already a response. And that means there's already some kind of understanding involved. Because our movement to hold out and to reach, our movement to resist and reject, is based on some kind of assessment of the event. But this is a foundational assessment, built into the fabric of experience itself. It's not something found later, once we consider what's going on.

And the Buddha says there are three fundamental responses, depending on the three categories of feeling. If the feeling of a sensation is pleasant, we're moved to hold it. If the feeling of a sensation is painful or unpleasant, we're moved to reject or resist. And if the feeling of the sensation is neither painful nor pleasant, we are moved to ignore it as beneath notice. Or if we do notice it, we're moved to confusion and doubt about it. What to do? Shall I hold this? Shall I reject it? Shall I hold it? Reject. Hold. Reject. The mind oscillates back and forth.

So these responses occur before we have made any conscious decision. And this brings us to the Buddha's teaching on cetanā, usually translated as intention, but perhaps we could see it as choice or decision. Cetanā is the decision to act that arises from the perceived significance of an event.

Now choice or decision, cetanā, is extremely important for the Buddha's ethics, for his teaching on how we live, because it represents how we shape the direction of our lives. And he even equates choice or decision or intention, cetanā, with karma, morally significant action.

So where does feeling fit into karma? Feeling represents the world as already given that demands a decision from us. We are already thrown into the world. And that thrownness has the flavor of vedanā. It's pleasant. It's painful. I don't know.

And it's that which demands a decision. What do I do about it? And our fundamental decision is all about how this experienced event that's happening right now is positioned in relation to us and our interests. Is it pleasant, to be held onto? Is it painful, to be rejected? Is it neither, to be not noticed at all?

So feeling has us already deciding, already engaging. The choice, karma, comes in later. It's almost like a kind of review of a commitment we've already made. Feeling is elemental. It's absolutely fundamental to experience. It's so fundamental that it's very difficult to get hold of, and it can be very difficult to understand conceptually.

At this level of elemental response, we find ourselves up against the limits of language. If we're going to speak about something, that something has to be an object out there, separate from the speaker. But feeling gives us a world before we recognize this world as separate from us. We are already committed to it. We are already responding, already entangled. And it's this response that we have to the world that helps create a sense of a world that we can recognize as separate from us and demanding our participation.

Feeling is absolutely elemental. It's before we construct any kind of perception, thought, and so on. It's the basis and foundation upon which we construct perception and thinking.

This brings us to the concept of sentience, which is another key concept in the Buddha's ethics. You notice that vedanā is right at the heart of the Buddha's understanding of ethics. For the Buddha, we are sentient beings, where to be sentient is to be aware and to feel. These are the two aspects of sentience. Living beings are sentient. Non-living things are not sentient.

For example, I may have an air conditioner and I may program it to maintain a steady temperature of twenty-five degrees by means of a thermostat. But we don't say that the thermostat feels hot or the thermostat feels cold. We, on the other hand, feel hot or feel cold. This capacity to feel is sentience. We are sentient bodies. This is another aspect of the Buddha's understanding of the human condition.

Sentience is central for the Buddha's understanding of ethics because our circle of ethical concern—who we should be concerned about—is that of sentient beings. In other words, the Buddha's ethical concern does not stop at the border of our species. Often in ethical systems, that boundary is taken for granted. But for the Buddha, all species that we can recognize as being sentient demand our ethical concern.

If you think about the first way of training, the first precept—abstaining from killing living beings—the beings covered by this way of training are sentient beings. We mentioned this on the first night: beings who feel pain, love life, and fear death. Roughly speaking, if a being tries to escape our blow, it's covered by this way of training. And you notice that the first characteristic of a sentient being is feeling pain. In other words, for the Buddha, sentience entails pain. If there is sentience, there is pain.

We could go so far as to say that the difference between a robot and a living being is not their comparative intelligence. That's got nothing to do with it. The difference is whether or not they feel pain. If an entity feels pain, that entity is sentient.

We won't speculate about robots, but there's no doubt that we are sentient. We are aware and we feel. And that means we are exposed to pain. That's built in. This becomes quite evident in our meditation practice. We run around living our lives caught up in our habitual obsessions and dullness.

And then when we press the pause button on all of that in order to meditate, when we allow ourselves to be aware of whatever we are experiencing now, without any barrier, what we recognise is the pervasive pain. Often in the form of pervasive restlessness, an inability for the body and the mind to settle and absorb into the present.

And that's one reason, maybe the main reason, why meditation is so easy to postpone. Did you know that there have been many scientific studies on mindfulness, and that these studies have proven beyond all doubt that of all human activities, meditation is the easiest to postpone? And you all know that, don't you, from your own experience.

Why is it so easy to postpone? It's because we don't want to expose ourselves to what we know or sense is happening just beneath the surface. When we give ourselves permission to feel whatever we are actually feeling now, without all the usual distractions and superficial preoccupations that we fill our days with, then we expose ourselves to an underlying sense of unease or dis-ease. And we don't want to see this because what it reveals is the vulnerability of experience, the pain inherent in sentience. It reveals the sensitivity of the heart and the uncontrollable flow of disturbances that arise when the heart's sensitivity is bombarded by sense stimuli.

I also suspect that this is one reason why, when we're meditating, we find it so easy to get lost in our thinking. Because if we get lost in our thinking, which we can do very quickly and easily—we're all very skilled at that—then what we're doing is running away from the immediate experience of the senses to live as refugees in a conceptual world. We create fantasies to separate us from the felt reality of the sentient body.

So if we're going to go deeply into our felt experience, what we need to do is face this vulnerability. Here we can talk about the role of feeling in our meditation practice. We've talked about feeling as being a way of experiencing, not just an object of experience. This suggests that feeling can be practiced. But how do we practice feeling, especially since it's so elemental and so entangled with the immediacy of experience itself?

I think the key is intimacy, which we talked about this morning. What we want to do is get close, as close as possible, to the felt touch of contact, the immediacy of sensation itself. And to do this, we have to open up to the vulnerability of sentience and drop the layers of armour that we normally carry, often in the form of layers and layers of concepts. We have to open up to the currents of pleasure and pain that are flowing through us regardless of our consent, often absolutely different to what we want.

One possible way of exploring this is, for example, when you're sitting, begin by checking feeling. And the easiest to check is pleasure and pain—they're the most obvious. Am I experiencing pleasure now? If so, I let myself relax into the pleasure. Am I experiencing pain now? I let myself surrender into the pain.

Now when we're doing this, we're not concerned about being clear or accurate in our awareness. Up to now we've been talking about being really precise, clear, accurate. But that concern for clarity belongs to what we were calling watching, the cognitive aspect of awareness. Here we're interested in feeling, which arises before perception, before judgment, before concept. So it may lack the clear boundaries of concept.

One of the reasons why we find concepts so attractive is that concepts have very discrete, definite borders. The concept of pleasant feeling—it's good, it's pleasant, I like it. Then there's this absolute border, and then you have the concept of painful feeling, and it's definitely not good. And they're definitely completely different. But all of that is concept.

The realm of feeling, the realm of intimacy, may lack these clean boundaries. Feeling is found in the disturbed vulnerability that characterises human experience before any perception or any concept arises about it. However, once it emerges, once it becomes clear, then we may become very clear about how the feeling is presenting itself to us. But this is after it emerges, and it's reasonably strong.

So if we're working with feeling, it's about surrendering into experience. Not getting lost in our concepts about the experience, but surrendering into it, relaxing into it. Staying with the vulnerability of sentience. And as we do this practice, we might get a sense of how deep these layers of concept go.

They're like layers of cling wrap blocking us from direct sensation. So we work our way through those layers. But of course, each one of those layers is characterized by feeling. So it's available. It's not that we have to dig deep down before we come to feeling. Every step of the way is dominated by vedanā.

But as a project, we're learning to stay with the vulnerability of sentience.

Now, we continue to construct a cognitive world out of our experience. We've been doing this quite literally longer than we can remember. So we're not going to stop now. But that's fine. When we notice that we're lost in a world of perception, judgment, and concept, what to do? Surrender to it and feel the intimacy and vulnerability of being in that world, the world of concept. Because that world also has its own unique flavor.

And as we do this, what we might notice is how feeling flows like a river. Nothing in it is stable. No single experience is reliable. When we're practicing with feeling, we're not disturbing this flow by clinging to any particular feeling. This is it. Grab it.

Of course we hold on to pleasant feeling, but we also hold on to painful feeling, which is really perverse, but that's what we do. Oh, this is my pain. This is the tragedy of my life. These other meditators, they think they've got dukkha. It's nothing compared to my dukkha.

This is the clinging to feeling which so characterizes our behavior. Instead, we enter into this river and allow pleasant to succeed painful, and painful to succeed pleasant. What we might find as we practice mindfulness of feeling is that feeling itself transforms. Pleasant segues into painful and back again. It's like a freely flowing river.

As mindfulness becomes stronger and clear understanding builds, we may discover more subtle levels of feeling—those that we originally sensed as neither painful nor pleasant. This is the level of feeling characterized by ignorance and delusion, and therefore the most difficult to actually pinpoint. Because if we pinpoint it, then we're clear about it, and so it's probably going to transform into something either pleasant or painful. This third category is the most obscure in practice.

But as we go deeper and deeper, this third category of neither painful nor pleasant transforms into genuinely neutral feeling. This neutrality emerges when the heart is dominated by mindfulness and equanimity. What characterizes it, quite counter-intuitively, is that neutral feeling—genuinely neutral feeling—is actually more pleasant than pleasant, usually. Which is quite odd.

But when this emerges, when the heart is dominated by equanimity and mindfulness, the neutral feeling represents the maturity of the practice, where, as the Buddha says in the Satipaṭṭhāna Sutta, the practitioner lives independently, not clinging to anything in the world. This represents, in its mature form, a stream of feeling that does not move into craving or drivenness. And so this is the equanimity of the awakened one.

Any questions?

"I think that today, and we've touched on it tonight, the idea that there's choice with vedanā. Is that right?"

Vedanā comes before choice. But then we're presented with a world in which we're already entangled. And then we recognize, oh, what to do about it? Then there's choice. And of course choice has vedanā. And what we choose has vedanā. Because vedanā is inescapable. It's not that there's vedanā here and then there's other things happening. All along the line—vedanā, vedanā, vedanā, vedanā, vedanā. This is one of the things that makes it so difficult to get a handle on.

This is a very interesting question: can one experience more than one feeling at the same time? This is the kind of question Buddhist philosophers have been debating for thousands of years, and it is indeed a very good question. If you follow orthodox Theravada, the answer is no—you can only have one at a time.

Does that mean one feeling is dominant? Not necessarily, but each feeling, like every event, lasts only for a moment and is immediately succeeded by another. So according to Theravada orthodoxy, if I think I'm experiencing two things at once, it's because the mind is going back and forth rapidly—this one, this one, this one, this one—and it merely appears to be two things at once.

But let me just say that this is a philosophical orthodoxy. It's not necessarily your experience. So the question is, as a practitioner, do you experience more than one thing at once? Forget about orthodoxy. Forget about neuroscience too. If you're making your living that way, I suppose you could go on about it. But we're practitioners, not neuroscientists. What they say is completely irrelevant to our experience. Never let someone talk you out of your experience. You're a practitioner—the one thing you have to rely upon is your experience. Your job is to be clear about it. If you experience something, that's it. You experience it.

Now, maybe if you want to bow down before the altar of neuroscience and worship accordingly, you might create an intellectual framework that says, "Oh, I'm experiencing more than one thing at once, but that's because my experience is inadequate, and if I go deeper, I will recognize the truth of whatever science says." But stick to your experience as a practitioner.

Someone wisely commented that they've had some experiences they don't want to stick to. That's a very wise observation indeed.

I'm not actually sure, but I always assumed that this one-thing-at-a-time doctrine—this is *khaṇavāda*, the doctrine of moments—is characteristic of Theravada. But I believe I read somewhere that every Buddhist tradition, at least in theory, subscribes to

this theory. They may ignore it in practice because it's completely unverifiable through direct experience. So you do find different attitudes in different traditions. But we're talking about orthodox Theravada here, not Theravada in general. I mean, how many people actually know what the orthodoxy is? How many practitioners doing meditation have the foggiest idea what Theravada orthodoxy actually says? Perhaps 0.001 percent. So it's pretty irrelevant. As practitioners, given that we're not doing a PhD in Buddhist philosophy, it doesn't matter what the philosophers think. What matters is: what do I experience? That's the important thing.

Someone mentioned feeling a bit dull, a bit foggy, and that while I was talking about this, it felt like a whole new way of dealing with that experience—just recognizing it as neither pleasant nor unpleasant, just this whole thing.

I'm always puzzled by the common interpretation of the third type of vedana. The Buddha says *sukha vedanā, dukkha vedanā, adukkhamasukha vedanā*. So the third one is literally "not unpleasant, not pleasant" vedana. That's precisely what he says. And I'm always puzzled why people think he's saying "neutral." If he wanted to say neutral, he would have said neutral. He has a word for neutral: *tatramajjhattatā*. He could have said *tatramajjhattatā vedanā*.

But he didn't. He said "not painful, not pleasant." So what is he talking about? I think, in context, what he's talking about is: I don't know. It isn't painful, it isn't pleasant—I don't know what it is.

And when you look at the three basic movements of the heart—greed, anger, and ignorance—ignorance arises from this third category of feeling. Why would ignorance arise from neutrality? This is what the Buddha says: you have the three movements—lobha, dosa, moha. Moha is generally translated as ignorance, and moha comes from the third category of feeling. That's basic Buddhism.

Now, I warn you that this is my interpretation, so feel free to chuck it out the window. Analayo says he's determined that the third category is neutral feeling, and I hesitate before I disagree with Analayo—but I just do. What to do?

All of this is theoretical, and so it's not particularly important from the perspective of the meditator. What's important is the clarity of your experience. If you have a question like "Is it neutral or is it something else?" or "Can two things be aware at once or not?"—these are excellent questions for practice. Clarify them in the practice. That process makes the mind sharper and clearer, and you go deeper into the nature of experience.

But what theory you wrap around it? That's not important. So long as you've got some kind of conceptual framework that helps you make sense of the experience, that gives it meaning in some way—that's all that counts. And it doesn't even have to be Buddhist. There are Christians who do Buddhist meditation, and their theoretical framework is Christianity. And it works.

A student shared that they had been thinking back to the earlier discussion about awareness and consciousness, and the Susan Blackmore poem with the question "What am I aware of now?" Their experience was that sometimes awareness seems like a shifting stage, but when they applied that question repeatedly—now, and then now, and then now—there was only one stage, and it became quite clear. They found that question helpful for clarifying what's going on.

Questions are important, but a good question is much more important than any answer you come up with. A good question sends awareness in a useful direction. It clarifies experience. So questions are good. And doubt can be very good.

Someone asked about magical thinking. What have you got in mind? What's magical thinking? They offered an example: "Crystals cure cancer." Do they? I tried it once—it only burned holes in my socks. That's pretty powerful.

No, I really have nothing to say about magical thinking. It's not something I'm preoccupied with. I see a lot of people firmly entrenched in magical thinking.

I think it's common. And while I view that as every minute they spend on magical thinking, which is just because they believe it makes it real, versus whether it's real or not, is one minute away from sitting. One minute away from practice. Probably wasting time.

But in this project, what we're interested in is the nature of experience. The project is to clarify the experience. And it's really important to have faith in your own experience.

In Burma, depending on the teacher, of course, but sometimes you go in for interviews six days a week and you give a very precise description of what you think is your best meditation over the previous twenty-four hours. Now, at some point, you're going to walk in and report something which is significant, which you may not know. You may not have the slightest idea.

And for some teachers, if you did that, the response would be a frown, even a grimace. And then an accusation: "You're making that up. You're telling me stories. You haven't experienced that. You heard someone talking about it and now you're coming

in and telling me about it. That's just your imagination. You must never be disrespectful to the Dharma and disrespectful to your teacher by coming in here and reporting something which did not happen."

Now this is in the context of a very hierarchical, authoritarian culture. So if someone gets that hammering, it's devastating. The temptation is to crawl out and hope they'll forget about it. But if the meditator stands their ground and says, with all respect, "I know what I experienced, and this is what I experienced," then the attitude completely shifts. And it's congratulations. Welcome to the club.

It's a way of really insisting that you've got to be clear about your experience and you've got to have faith in it. Because that's the only thing you've got to rely on when you're doing this practice. So it's a very important point. Don't get caught up in ideologies. Don't take an ideology and impose it on the experience. Keep the experience clean.

A lot of the time it's very difficult to find the language to explain. Describing experience is like describing music. And that's another problem, of course—the problem of how do you communicate experience in words. Some people are better at it than others and they, in a sense, have an unfair advantage.

But how can you be clear on your experience and sure about it? You'd be clear about what's coming up now. There's something happening now. What is it? That's the basic principle. Including what's coming up now might be the experience of memory arising now. And what is that experience?

CHAPTER 40

Tracking the Thought-Stream (Workshop)

Patrick Kearney · 52 min

In this workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney guides practitioners into the third foundation of mindfulness: contemplation of mind (cittānupassanā). Working within the Mahāsī Sayādaw framework of grounding and secondary objects, he addresses one of meditation's most common challenges—the addictive relationship with thinking that characterizes modern Western culture.

Kearney emphasizes a crucial distinction: thinking itself is not the problem; our obsessive identification with thought content creates suffering. Drawing on the image from Nisargadatta Maharaj of a mother watching her child play with a toy, he teaches practitioners to step back from absorption in thought content and instead observe the activity of thinking itself. The workshop explores how thoughts construct and reinforce our sense of self, noting that the fear of losing this thought-constructed identity often generates panic and more thinking when the mind approaches stillness.

Through a series of meditation experiments, participants investigate non-content aspects of thinking: How do thoughts appear—as words, images, feelings, or perceptions? Where in the body do thoughts seem located? What does thinking feel like—pleasant, unpleasant, or neutral? These inquiries apply the same precision of awareness developed with body contemplation to the cognitive dimension of experience. By directing attention to these formal qualities rather than narrative content, practitioners cut through the addictive pull of the thought-stream, weakening habitual identification and opening to what the Buddha called suññatā (emptiness) and anattā (not-self). This approach transforms distraction into a doorway for investigation.

In these morning workshops we're going through different aspects of the practice, and the practice is based on the framework of the four Satipaṭṭhānas.

When we begin, we spend a lot of time working on our relationship with the body because that's the first of the four Satipaṭṭhānas and it's the foundation for the practice. Then we move on to vedanā, feeling, which is so important that it gets its own Satipaṭṭhāna. And now we are entering into the third Satipaṭṭhāna: citta, usually translated as mind.

Here we come across what we were talking about before—that when the Buddha analyzes the human condition, he distinguishes between the cognitive aspect of the mind and the affective aspect. So roughly speaking: head, heart. Rationality, feeling. Today we're going to have a look at the mind, focusing on one aspect of the cognitive aspect of mind.

As you know, we're working with the basic framework laid out by Mahasi Sayadaw. In this lineage they talk about what we are aware of, the meditation object, in terms of grounding object and secondary object. The grounding object is the meditation object with a capital M and a capital O. This is what we focus on. This is the central reference point. This is where we learn to settle awareness and to keep it settled over a period of time.

What serves as the grounding object varies from person to person and from time to time, but it's important that we have a sense of it being our default position. Let's say we sit down to meditate. You think, what should I do in this sitting? Grounding object. It's the default.

But of course, inevitably, we're pulled away from it. When we're pulled away from it—okay, I've been dragged somewhere else—what is this? Secondary object. So: grounding, secondary. The secondary appears, at least in the early stages, as distraction—what pulls me away from the grounding object. As the practice develops, the whole relationship changes. The structure of grounding and secondary actually evaporates. When we practice, we're simply with whatever is happening, and whether it's grounding or secondary is completely irrelevant. But as we go through in these mornings, we're looking at it from the point of view of this structure of grounding and secondary.

Now, one area of human experience that people talk about as providing distraction is thinking. Has anybody here been distracted by thinking? One or two? Once or twice? Big tick on that one. It's a major source of distraction, particularly in our culture. I think other cultures don't have this as such a big deal because they're not so obsessed with their thinking. But in our culture, it is normal to be completely obsessed with thinking. So this brings us to what we could call the thought stream—the endless stream of thought generated by the mind.

Now, thinking gets a bad press in meditation. You get the subtext: what I want you to do is sit there for an hour and don't think. There is actually a meditation exercise, which I used to do—I don't do it anymore—where basically we get people to sit down, settle awareness, and then: stop thinking. Don't think. That's the instruction. It's quite interesting what comes up as a result. But we won't do that today.

Thinking is just part of nature.

Thinking gets a bad press, but there's nothing wrong with it. It's just part of nature. Thinking is not the problem. The problem is our relationship to thinking—that we are obsessed with our thinking. In other words, our relationship to thinking is addictive.

If you have a friend who's fond of a particular substance, and if you feel that this substance they're very fond of is leading them down dangerous pathways and is basically bad for them, you might rouse up the courage to suggest, "Maybe you should think about dropping it. Because it seems to me you're a touch addicted." And your friend gets all upset and says, "I'm not addicted. I could stop any time I want." What would be your response? We'd think, "Oh, definitely addicted." That's the problem.

How many of us can just stop? When I was in Burma, at one point I was going through a lot of incredibly obsessive and generally painful thinking. I was doing this long retreat, and one of my fellow meditators—he had ordained as a monk temporarily—had gone off to a branch monastery. But he came back for a visit to do something at the main center where I was. We had a little chat and he asked, "How's it going?" I said, "It's going really, really badly. I just can't stop thinking." I talked about my difficulty, and he said, "Look, I've got the solution for you. It's basically very simple." I said, "Do you?" Because this guy was a very good meditator. "What's the solution?" He said, "I'll tell you what I do. I get up in the morning—wake-up time was like four a.m. or something—and I go outside to my walking meditation place. I stand at the beginning of the walking track and I make a determination, an adhiṭṭhāna: for the next two hours I will not think. And then I just do walking meditation for two hours without thinking. By then it's time for breakfast and I'm set up for the day." And I said, "Oh. Is that what you do? Thanks."

Most of us can't do that. So in this situation, what we need to do is start to get interested in the addictive relationship. It's not the thinking which is the problem. It's the relationship which is the problem. And that's what we need to investigate.

The mind is constantly throwing up thought sparks, like sparks from a fire—little thought moments. What happens is that the mind is kind of hovering around and it sees one of those little sparks, thinks it looks interesting, grabs it, and turns it into a story. And then we get absorbed into the story.

Now, why are these stories so entrancing? Why are they so addictive? They're entrancing because they're all about me. When we think, who do we think about? We think about me. We're not completely narcissistic—we think about other people—but we think about them in relation to me. My friends. My enemies. My past. My future. My family. And so on.

It's all about me. And this is what makes thinking attractive, if not addictive. Thinking is a major way in which we build up, construct our view of ourself. In a sense, we are who we deeply think we are. And thinking solidifies that.

During that period of time when I was really wrestling with thought, I was approaching it through heroic effort. And gradually, gradually, gradually, the thinking level would decline. Until it reached the point where I really noticed that it was very close to disappearing. And at that point, what would arise was panic. And then, up goes the thought again.

I realized what was going on was fear. Who would I be if I wasn't thinking? Would I even exist? The mind was just horrified by this prospect. And in a panic, it immediately generated more thinking.

So I learned that a lot of this is about identity. And a lot of it is about habit—deeply ingrained habit. And identity and habit go together.

If we learn to track the thought stream, to use the thought stream as a meditation object, what this does is cut through our deeply ingrained determination to identify with the world created by thought. And it opens us up to a world beyond thought. This is the world that the Buddha called emptiness, sunyata, or not-self, anatta.

So let's have a look at how we go about doing that.

The basic principle is, as we've been discussing, that we're always dealing with a dyad of awaring and what is aware. Minding and what is minding. Awareness and its object. It's always that dyad we're working with. And as we've said, normally what we think is important is the object. So we have experiencing, which is an activity, and what we experience. All our lives, we've been projecting importance into what we experience. That to us is what's important, not the experiencing. So we tend to overlook it, although we can't have the one without the other.

This is particularly evident with thinking. Normally when we think, we assume that what is important is what we are thinking about—even when we know it's complete rubbish. We still, in that moment, think it's important. So we take for granted the activity of thinking, how we think.

But when we're tracking the thought stream, we're not interested in what we are thinking about. What we are thinking about is of no interest whatsoever. What we're interested in is the activity of thinking. We are interested in thinking, not thoughts. This is a very important distinction.

To get a sense of it, I always cite a passage in the writings of Sri Nisargadatta Maharaj. He talks about meditation practice and compares it to a mother watching her child play with a favourite toy. So you have this image of the child and the toy. The child is completely caught up in the toy, completely absorbed with it. And then just over here, there's the mother. She's not particularly interested in the toy. What she's interested in is the child playing with the toy. She's interested in the game, in the relationship. That's what she's focused on.

Normally, in our relationship to thinking, we are like the child—completely obsessed with the toy. Our job is to step back and become like the mother, watching the child play with the toy. We're interested in the play of thinking and our relationship with that play.

So the basic method is to find some aspect of the activity of thinking that is not the content of our thoughts, and make that our meditation object. We're going to play with this, doing some meditation experiments. Again, it's important that we have an attitude of play. Don't take them seriously. It does not matter what happens when we do these exercises. But it would be nice if we enjoyed ourselves as we play.

In each exercise, we begin by settling awareness in the body. At some point, I'll direct attention to some aspect of the thought stream. If you get lost in thinking, simply drop it and come back to the body. Once you settle, return to the exploration. That's what we'll be doing.

Let's begin.

Settle awareness in your body, constructing the meditation posture. Start with the sensations at the base of the body, finding the balance, then lift up through your spine. Let your chest open, your shoulders relax. Lifting up through the spine, up through the neck, up through the head—around that lift, relax down. Then settle into your normal meditation object.

Are you thinking?

If you are thinking, and if you know you are thinking, then thoughts must be appearing to you in some way. How do thoughts appear? Do they appear as words? Do they appear as visual images? Do they appear as feelings? Do they appear as combinations of these? As something else entirely?

Study the flow of these thoughts. Don't focus on their content—what they are about—but on their appearance, how they present themselves to you. How do thoughts appear?

So, how do they appear? How do you know you are thinking?

One student shares that it starts with a visual image—sometimes aided by a word, a name—but it begins with a perception, a recognition. You recognize that something's happening, then you put an image on it, and that may be supported by a word.

Another student describes how you build an image, or you see the image, then you get some words, and you might even see text, and then it just changes. So you start with a sense perception, then there's an image supported by words, and they entangle each other, and away you go.

Another student describes a more complex unfolding: it began with the words of the question itself, hearing the words reverberate. Then other things started to add on—there was a bird, hearing the bird, a baby bird calling out—and an immediate response arose, a slight annoyance: "Oh, there's that little puppy bird again." There was an affective aspect as the entanglement began, starting with sound, then drawing in both words and visual images.

Images. Yes. Together? Yes.

I think sometimes there's a feeling that's present which makes my ability to see what's actually there somewhat vague. At some point I'll pick up a story about that feeling being there, but the feeling might just be something like, "Oh, I don't know if I'm doing this right." It's not actually the words—it's just a feeling. The feeling comes first, in this case.

I've done this experiment for a long time, and for most people it will be visual images, feelings, and words in different variations and combinations. And here we had something different: we had perception. The perception of the sound—this definitely came up twice.

So these three appear to be the main ways in which we think, and people have favourite ways. Usually there's a combination, but you get different weightings. For example, for me, I'm definitely a word man. I think in words.

For the fellow word thinkers: is there one voice or more than one voice? Does anybody have discussions, conversations between two separate entities? Some people have more than one person in there, having a chat. But some people, like me—I'm strictly a monologue person. My fundamental principle of thinking is that I never let anybody get a word in edgewise. I sometimes wonder whether that's why I became a teacher. Expounding seems to be my natural mental state, which is a bit of a worry, but what to do?

Now notice what we're doing here. We're just taking thought, but we're looking at an aspect of it which is not the content—it's not what it's about. In this case, it's the appearance. How do I know that I'm thinking? How does thought appear?

Normally, if thinking is going on, the awareness goes straight to the content, the story itself, and we take this for granted as being obvious. But here we ask you to try switching the aim from there to over here—to the appearance, how it appears.

So you notice that this is about aim, and this is about accuracy. This is what we've been practicing throughout this retreat, starting with the elements. We've been doing it with the body, getting a sense of what it means to be accurate with the awareness. Then we can bring that accuracy into the mind and start to tease apart the thinking process. This is the basic methodology, and we'll have just a couple more experiments to look at other possibilities.

"Yes, that sense of two voices in there talking back and forth. Invariably, there's one observing with an opinion or judgment—'that wasn't very kind' or 'return to the present'—that kind of thing. Catching that commentary."

So you've got the chatter, but over here you've got the commentator. And the commentator is saying, "Oh, you should... that's good... no, that's not... what are you doing that for?" and so on and so forth. The commentator at the back.

Some meditators say this is the most stubborn aspect of thinking in meditation. Even when they've got a nice samādhi going and the mind is very quiet, still in the background there's someone commenting, "Oh, the mind is quiet now."

"Oh, that's good. Maybe I should try doing this." The commentator seems to be very ubiquitous, and people say very difficult to let go of. In some respects, the commentator is an expression of wisdom, of understanding—but it's coming out as thinking instead

of just being able to be intuitive without the concept. Simply a knowing. A knowing that this is wholesome, this is unwholesome, without having to say "this is wholesome, this is unwholesome." The annoying commentator. A very common experience.

When you're monologuing, do you have an audience? Are you in specific spaces? Sometimes there's an explicit audience, sometimes there's no particular audience. And sometimes what I've done, when I realize I'm caught up in monologue, is I drop in the question: where's the audience? I can't even physically look around, but there is one. And then I can drop it. Because I have to convince myself there's an audience. The audience is conjured up, but that assumption that there's an audience is actually pretty weak, because there isn't one. By recognizing that, it helps to drop the monologue. Just ask: where's the audience?

Let's try another exercise. Here we're going to work with a question that I know has been bugging you for a long time, but you've always been afraid to ask. And this question is: where do you think?

Let's again settle into your meditation posture, constructing the posture from the ground up. Feel the contact of the base of the body and from there lift up through your spine. From there, settle into your usual meditation object.

Are you thinking? Turn your attention to the place where you think. This is similar to finding where physical sensations arise. The difference is that physical sensations have physical location, while the thought stream may not. People may experience their thoughts in the general area of the head, and it can be useful to begin there—but do not take anything for granted. Don't assume that you already know.

Where do you think? Is there a specific location? Is there more than one location? Does this location change? Or is there no location? Where do you think?

So where are those thoughts? The left side of the brain, with a connection going down into the heart. Inside the skull or outside? Inside and outside, going down into the heart. So there's a connection between the heart and the head. And they start in the heart and go up, so the thinking begins in the heart and goes up to the left side of the brain. It really takes shape in the brain, but it starts in the heart.

Anyone else? In the eyes?

Yes. I have access to a 150-inch TV screen.

So visual or auditory as well?

No, not so much. Mostly visual. Probably 98% visual.

And is the screen in the eyes or outside the eyes?

Outside. Just outside. Pretty close.

So you get a close-up of the big screen.

Anyone else?

I had two locations, depending on the type of thought. The normal sort of energetic thinking just happened around the head. But feeling states and tiredness—when those are predominant, the thoughts were slower and they were coming from here, from the heart area. And with me, whenever I focus on my thinking or ask myself what my next thought will be, there are no thoughts. That's the quickest way to quiet the mind. But sometimes, if I want to focus on my breath or something in my body, the thinking will start up. And then if I focus on my thoughts, the awareness becomes very recalcitrant. The awareness goes to the body and there's an absence of thoughts.

So you've got energetic thoughts up in the head area. But the more emotive thoughts are located in the heart. The slow thoughts are here, and the energetic ones are up here. And then thought behaves bizarrely in that if you turn your awareness toward thought, the thoughts go away and the awareness settles nicely with the meditation object. But if you try to get to the meditation object, they go up into thinking. The mind is definitely recalcitrant.

So here we have another exercise in which we give ourselves something to do: Where is it? Did anybody fail to find any location at all? Some people find it difficult to track down any kind of location. Some people say, "I can't find it. I can't find any location." And then others will say, "It's not that I couldn't find it. It's that there is no location. Location does not apply. It's a category error to look for a location." Does anybody have that experience? A very clear sense that there isn't a location?

Possibly. I was thinking it's in the head, but maybe it's my perception that thoughts might be coming from there. I didn't feel anything in any particular location.

So you expected them to be in the head, but they weren't there. There's definitely a stream of words, but you couldn't pinpoint any location. It's possible that you just couldn't pinpoint it. But there's also the distinct perception that there definitely is no location—that location does not apply. This is a different experience.

Some people will report that they hear a sound and that stimulates the thought, so it begins in the ear, and so on. But other people will say that's not their experience at all. So again, it's always a matter of the actual experience. We're not looking for the correct

experience. We're just trying to clarify: What is the experience? And what is it today, this morning? It could be completely different this afternoon. You never worry about that. It's just: What is it right now?

But sometimes people are quite clear that location does not apply. In a sense, thinking is both everywhere and nowhere simultaneously. Location simply does not apply.

But again, it doesn't matter what the answer is. The point is that by asking the question, you're directing awareness to some aspect of thinking which is not the content. And if I'm directing awareness to some aspect of thinking that is not the content, then in that moment, I am not caught up in the content. Which means I am not caught up in my usual addictive relationship. I've cut through it. Maybe only for a few moments, but I've cut through it. And therefore, I'm weakening that addictive relationship.

We have time for another exploration. Let's try feeling—in other words, the basic question is: what does thinking feel like?

So again, establish your posture, constructing your meditation seat. And from there, settling into your normal meditation object.

Are you thinking? As thoughts cascade through your mind, don't concern yourself with what you are thinking, but how it feels to be thinking. Are you enjoying it? Is it pleasant? Do you dislike it? Is it unpleasant? Do you not care about it at all? Is it neither painful nor pleasant? How does it feel to think?

Okay, so how does it feel to think?

"That particular thing—all the spinning, when you stop on something. What do you call it? Like a lottery wheel. And the other image was the compost tumbler. That was my very first thought when you asked what it feels like: tumbling all over the place, and you're rubbish. Not being able to land on anything."

Anyone else? What does it feel like?

"Unacceptable."

Really nicely described.

"I find it really unpleasant. It feels like being caught up in a whirlpool. But thoughts that arose when I was simply responding to the wind—those were kind of lighter. It was like, 'Oh, I've noticed that.' And then I would get into more commentary, and then it became unpleasant."

So wind was pleasant and commentary was unpleasant.

"Yeah, just noticing what's happening outside felt very small, infinitely light."

"It felt like it was in the center of my head, right between the ears. It was tight, with tension. And then when it would drift off toward some commentary, it would drop down a little toward the throat. So it was slightly heading in that direction, like, 'Okay, I'm going to talk now.'"

So the whole thing was uncomfortable?

Generally.

But you also found a very specific location.

Yes, yes. It's uncomfortable, but it felt separate from a more unified experience. I didn't have this experience now, but when I see something that isn't kind, or I feel a barrier come up between myself and another, I can feel it in my heart—I feel like a contraction. It was sort of that kind of thing.

Yeah, good. Totally. I think for me it would tend to be on a thought—like I had an angry thought, and that's what I'm uncomfortable with, that kind of thing. But then I have this sense that all of a sudden you're in a state where you're spiritualized. It's interesting how when you're working on the feeling, the physical sensations also become more clear, more apparent for some people.

But again, it's a basic principle: find some aspect of the thinking process that is not the content, and make that the meditation object—in this case, feeling. Another possibility is the body. The question would be: do you think with your body? Does the body respond to the thinking? If so, how? These are all possibilities, but you see they're all illustrations of the basic principle. When you're caught up in thinking, number one, don't believe the story. Drop awareness out from the story, and then go into some aspect of the thinking process which is not the story, and zero in on it.

Now, you'll notice that mind is really, really quick. So it could be with these exercises that you only have to do it for a moment or two. It's like, "Oh, that's where it is," or "That's what it feels like," or whatever. And that can be enough. Then back to the grounding object. Or you might stay in there longer.

Generally, working with the thought stream is very high energy. A couple of you mentioned the energy of the thinking mind. And that means that using the thought stream as a meditation object, for most people, they can't do it for very long because they just get spun out. It becomes too much. So it's not suitable as a grounding object—

for most people. Some people can, but they're a minority who would use it as a grounding object. But in the context in which we've introduced it, it can be useful to play with when you realize you're distracted by thinking.

And once again, the basic principle is: what is a distraction? It's a meditation object wanting your attention. So note it. Be aware of it. But when you're aware of the thought stream, it is very tricky. So it helps to have a sense of what you can actually do, how to be aware of it. And these are basic games to learn how to do that.

Is it worthwhile tracking back thoughts? Sometimes I find, once I've been lost in the stream for a while, I find it helpful to trace how I got here from there.

Yeah, that can be quite a useful exercise. The question would be: what happened just then? How did it begin? And then you track back, track back to the initial arising of the thought. Some people really like that—they do it a lot. And other people don't do it at all. But it can be quite a useful exercise. And it's the same principle. You're treating the thinking as a conditional process, as you point out, and you track it back. What sparked it, and how did it move from A to B to C?

Some thoughts can be quite bold. You notice it, and it could be half an hour later. And that is, you could say, from a meditation point of view, one of the most dangerous kinds of thoughts—the ones that suck you in completely.

But the important thing, even there, is that once you know you're thinking, then you can work with it. We do have this very common experience that we're thinking and we don't know we're thinking. At that point there's nothing I can do, because I don't know. But as soon as I know it—bang—I can bring awareness to it.

This is a vortex. This is a black hole. What does the black hole feel like? Where is the black hole? What is it doing? Is it light? Is it heavy? Is it attractive? Is it disturbing?

So we're always working in the present. What's happening now? And that gradually builds our relationship with the present, builds the capacity to simply be present.

Okay. Your mission, if you choose to accept it, is to stop thinking. But if you can't manage that, please be aware of your thinking process.

CHAPTER 41

The Mirror of Dharma Part 1

Patrick Kearney · 51 min

In this first of four talks on "The Mirror of Dharma," Patrick Kearney draws from a 1960 teaching by Mahāsī Sayādaw originally given to experienced practitioners to help them assess their own attainment. The talk centers on the Brick Hall Sutta (SN 55.8), where the Buddha, weary of being asked about deceased practitioners' destinies, offers the "Mirror of Dharma" as a tool for self-assessment of stream-entry (sotāpanna).

Kearney explains the Buddha's four stages of awakening—stream-enterer, once-returner (sakadāgāmī), non-returner (anāgāmī), and arahant—noting that awakening is a process rather than a binary event. He presents both psychological and cosmological frameworks for understanding these stages. Psychologically, stream-entry involves the cognitive breakthrough of abandoning sakkāya-diṭṭhi (view of self-identity), directly realizing anattā. The affective dimensions of greed and hatred, being deeper than cognitive delusion, require the subsequent stages to overcome.

The talk emphasizes that stream-entry marks a point of no return on the path to full awakening. Drawing on Mahāsī Sayādaw's insight, Kearney highlights how the stream-enterer grasps the essential simplicity of practice—continuous awareness of nāma-rūpa phenomena arising in the present moment. This understanding, once realized, cannot be forgotten. The Buddha's criteria for stream-entry include experiential faith in Buddha, Dhamma, and Saṅgha, plus virtues "dear to cultivated ones"—an ethical life arising naturally from the direct experience of not-self and consequent empathy with all beings.

This is the first in a series of four talks on the theme, The Mirror of Dharma. And I have to confess, I'm making this up as I go along, so I hope it's not too ragged around the edges. But we shall hope and see.

So let's begin. This comes from a talk—a long, obviously a very long talk—given by Mahasi Sayadaw in 1960 to what is described in the title as "fully practiced yogis." The purpose of it was to help them be confident in reading their own experience, in understanding their own experience. The talk was published for limited circulation, and presumably limited only to mature practitioners or fully practiced yogis, perhaps. When I was in Malaysia one time, I came across a typed photocopy of this, which was given to me. So I took it home and promptly worked on it. And I was pondering what to do in this retreat, whether we should have a series of Wednesday night talks. I thought, well, the Mirror of Dharma—that would be a good place to start. So here we are.

We're back in 1960. Mahasi Sayadaw is teaching these practitioners, and they are essentially graduates of his meditation system. He was teaching them so that they could make an assessment of their own practice and an assessment about their level of attainment—what had they attained in the course of doing all this?

The thing is, of course, that assessing one's own practice and assessing one's own level of attainment is not easy or straightforward. Mahasi said to them: "Some would hold the opinion that every yogi can decide for himself on the stage of insight knowledge experienced by him, together with its name. That's just not so. For their knowledge, they will mostly know the uniqueness of samādhi ñāṇa, knowledge born of concentration, but are not capable of deciding on the naming of the particular insight."

In other words, he's saying what we understand when we meditate is the specific events that we go through as the practice develops. But we don't know the name of these events, these experiences. We can't read the experience. We don't know what it means. We don't know where it fits in a broader context.

Mahasi Sayadaw adds that the only person who can actually recognize somebody else's attainment is the Buddha, who of course is not available. And since he's not available, this suggests the importance of the yogi being independent. They can't rely on the Buddha to tell them what's going on. And they need to be accurate in their assessment. If nobody can tell me what's going on, then I have to decide for myself. But how can I if I don't understand my own practice experience and how that individual experience fits into a broader system?

So here we have Mahasi Sayadaw educating his graduate students on the meaning of what they have gone through. And he begins by going back to the Buddha, to a particular discourse. We're going to look at this discourse. This is Saṃyutta Nikāya 55.8, The Brick Hall.

It begins: "This is how I heard it. Once upon a time, the Blessed One was living at Nātika in the brick hall. Then Venerable Ānanda approached the Blessed One, greeted him respectfully, sat down to one side, and said to him: 'Bhante, the bhikkhu named Sāḷha has died. What is his destination? What is his future state? The bhikkhunī named Nandā has died. What is her destination and future state? The male lay follower named Sudatta has died. What is his destination and future state? The female lay follower named Sujātā has died. What is her destination and future state?'"

First of all, you notice that everybody here takes for granted life after life. That's just a given. And everybody takes for granted that the conditions of one's rebirth is a direct reflection on the maturity of one's practice. So this question is really asking: How far did these people get in their practice? Were they enlightened?

The first thing that strikes me when I read this is how the love of gossip about one's fellow practitioners goes back a very long way, right back to the beginning. Don't we all want to know? There are a number of different discourses in which the Buddha is asked this question for different people.

But we're just looking at this one. And in this instance, the Buddha begins by answering the question directly.

He explains that Salha is an Arahant, meaning fully awakened. Nanda attained "spontaneous birth due to attain Nibbana without returning from that world." Sudatta "became a once-returner," and Sujata "had, with the utter destruction of three fetters, become a stream-enterer, no longer bound to the netherworld, fixed in destiny, with awakening as her destination."

So each of these people had attained some measure of enlightenment, from full awakening in Salha's case, down to stream-entry for Sujata.

For the Buddha, awakening is not a binary. It's not that we're unawakened and then suddenly—bang—we're fully awakened. It's a process. And this makes a great deal of sense when you get to know the Buddha's teaching, because he's always talking about process. The practice is a process. Life is a process. Death is a process. So it's not surprising that awakening, enlightenment, is also a process.

He says there are four stages of awakening. In order, these are: stream-entry (*sotapanna*), once-returner (*sakadagami*), non-returner (*anagami*), and fully awakened (*arahant*).

Let's get a sense of what he's talking about here.

Starting at the top, we have the arahant, who is fully awakened. *Arahant* literally means "worthy" or "deserving." The idea here is that there's an assumption that arahants are monks or nuns, bhikkhus or bhikkhunis. Lay people support bhikkhus and bhikkhunis in their practice—they feed them, house them, clothe them, look after them. But of course, the question swimming around in everybody's mind is: are they worthy of this support? Are the lay people getting a return on their investment? The answer is yes, once the practitioner attains full awakening. But until then, not so much. So you can see that the standard is pretty high.

The standards have come down over the centuries, of course. When I was at the Mahasi Centre, we'd go in for interviews—for example, with U Pandita. He conducted his interviews in his reception room, which also had a large library of books. Now, in our culture, interviews are private, one-on-one. Close the door. Nobody else can hear. But there, you'd go into his room, and apart from your fellow practitioners lined up behind you sitting against the wall, there would be a Burmese family. Each day, a different family. And you might wonder, what on earth are they doing there?

Well, the answer is they're the ones who paid for today's meals. They're feeding the meditators that day, and they want to see what value they're getting for their investment. So they're checking out the practice standards. Nothing private about it—which is very interesting.

So this is the arahant. What is full awakening? Briefly, all greed, hatred, and ignorance are completely gone, vanished, and they're not coming back. Arahants are rare, particularly in today's world. And just as an aside, Mahasi Sayadaw was regarded as an arahant.

So that's at the top. At the bottom, we have the stream-enterer. Stream-enterers are those who have had the first glimpse of reality. In other words, they've experienced the *dhamma cakkhu*, the vision of Dharma, at least once. They are much more numerous—there are far more stream-enterers wandering around than there are arahants. In fact, Mahasi Sayadaw's practice system was designed specifically to bring ordinary people along from normal everyday delusion to stream-entry. Hence the "fully practiced yogis."

His talk is addressed to. So these are graduates of the system, which means, as far as anybody's aware, they've attained stream entry.

Now the central insight that characterizes stream entry—in other words, the central insight that this practice is aiming at—is conveyed by the idea of the abandonment of sakkāya-diṭṭhi, which can be translated as the view of the reality of the person. Sometimes you see it translated as "personality view," but it goes a lot deeper than what we would normally call personality. The stream-enterer directly realizes anattā, not-self, and recognizes that the identity he or she has constructed since birth is no more than a construction—a network of concepts that he or she has been busily building all this time. In other words, fundamentally, this individual person is not real. She is real only as a network of concepts. A person who actually gets this, who fully understands and embodies this, is one who is described as accomplished in view, diṭṭhi-sampanna. And this person has made the breakthrough, the abhisamaya.

We'll talk about this later on during these talks, but notice again that Mahasi Sayadaw's audience are these people. Presumably they wouldn't have been in that group if Mahasi Sayadaw thought they shouldn't be, so they probably were stream-enterers.

Stream-enterer at the bottom, Arahant at the top—and as we move from stream-entry to Arahant stage, we could chart the number of graduates of each level in a non-linear curve of ascending difficulty and rarity.

Now this is my personal opinion. People who could be reasonably considered as attaining the second stage of awakening are much rarer than those who made it to the first stage. People who could be reasonably considered as attaining the third stage of awakening are much rarer than those who made it to the second stage. And people who could be reasonably considered as attaining the fourth stage, the Arahant, are much rarer than those who made it to the third stage. Again, that's just my personal opinion based on my own observations.

The first one and the last one are both reasonably straightforward. The final one is fully awakened—pretty abstract, but it's clear intellectually, conceptually. And the first one is reasonably clear: direct recognition of not-self. But what about the in-betweeners, called once-returner and non-returner?

There are two ways to make sense of these classifications: psychological and cosmological. The names themselves are essentially cosmological, so let's start with the psychological.

This rests on the Buddha's distinction between the cognitive and the affective aspects of human nature, which we've already discussed in this retreat. When the Buddha talks about the cognitive problem that we have, or the problem that we have looked at cognitively, he says the problem is avijjā—ignorance or delusion. I don't know what's going on. And delusion is stronger than this: I don't know what's going on, but I think I do.

Sometimes I've heard Buddhists adopt an air of superiority over Christians because Christians are burdened with the doctrine of original sin. And I shake my head and say Buddhists are far worse off. We have original delusion. It's a lot worse.

Now the solution to this problem is bodhi—classically translated as enlightenment, though we've been translating it as awakening because linguistically that's actually what it means. So that's the cognitive aspect of the teaching.

Then you have the affective aspect. What is the fundamental problem that we have? It's what the Buddha calls taṇhā, literally thirst, and essentially it's drivenness—the drivenness of the heart. What's the solution to the problem? Nibbāna, or in English, nirvana, which is an affective term. It's the cooling of the heart.

You're probably all familiar with the idea of the three fires or the three poisons, often translated as greed, hatred, and ignorance. If you look at those three, you'll notice the first two are affective in nature—they're of the heart. I want. I hate. And the third is cognitive. For the Buddha, the power of the affective is central to understanding the human condition. The Western tradition emphasizes the centrality of rationality in human nature, so we tend to see humans as rational beings who also feel.

But the Buddha tends to see us as feeling beings who also think. And this is entailed in the idea of sentient beings that we've already talked about, where to be sentient is to feel and to be aware—but in particular to feel, and in particular to feel pain.

And this is where we see why the stages of awakening beyond stream entry are progressively more rare. Stream entry cuts through *sakkāya-diṭṭhi*, the view of the reality of the person. And you note that view is cognitive. So this initial breakthrough is cognitive in nature—it's not affective, it's cognitive. And this means that while the practitioner has significantly reduced the ignorance or delusion that characterizes the human condition, greed and hatred continue to roll on. The affective drive continues to haunt us.

So in ordinary everyday language, while we have a deeper understanding of what is going on, we remain driven by our disordered emotions. Now the advantage of the realization of stream entry, this vision of Dharma, is that although the practitioner still clings to the affective drives, when he is mindful, he sees what he's doing when he gets caught up in these, and he recognizes that no specific experience—including this experience of being driven—actually belongs to him. And when he recognizes this, he lets it go. If he forgets his mindfulness, he can get caught up again. But sooner rather than later, he will recognize what's going on and let go.

At the second stage of awakening, greed and hatred—in other words the affective drives—are greatly reduced. And at the third stage of awakening, all but the most subtle affective drives are gone. So what this model suggests is that of the three fires—greed, hatred and ignorance—the most difficult to abandon are the first two, greed and hatred. The affective drives are deeper and more difficult to come to terms with than the cognitive delusions.

So when we see that the practice of insight, *vipassanā*, favors the cognitive—seeing and understanding—this is because it's easier to change the cognitive. It's harder to change the affective. This is a kind of psychological explanation of the model.

But then there's the cosmological one, which in the Buddha's time they took for granted, but to us is alien. In the Buddha's cosmology, the human realm is located between the heavenly realms above and, roughly speaking, the hell realms below. The heavenly realms are those characterized by the dominance of happiness, and the hell realms are characterized by the dominance of pain. We are in the middle.

Cosmologically speaking, practitioners who attain the second and third stages will tend to be reborn in the higher and more subtle heavens. A second stage practitioner will "return once" to the human realm, while a third stage practitioner will "never return" to the human realm. Hence, "one-returner" and "never-returner." This is the basic model. It begins with the stream-enterers, and they're the ones we're going to focus on.

So let's come back to our discourse. We read how the Buddha answered these questions about the fate of his senior students after their death. However—if it's not too disrespectful to say that a Buddha sometimes gets fed up—then he's showing clear signs of doing so in this discourse. After answering the question, the Buddha says:

"It is not surprising, Ānanda, that a human being should die. But if each time someone has died, you approach and question me about this, that will be annoying for the Tathāgata."

Tathāgata is how the Buddha would refer to himself—a title he used for himself. And so he says:

"I will teach you an explanation of Dharma called The Mirror of the Dharma. A mature student who is equipped with this could independently declare: 'I am one who is finished with hell, finished with the animal realm, finished with the domain of spirits, finished with the realms of misery, the bad destinations, the lower worlds.'"

So someone who has this Mirror of the Dharma can be confident in saying, "That's it, I'm done with these lower realms. I am a stream-enterer, no longer tied to the lower realms, fixed in destiny, with awakening as my destination."

No longer tied to the lower realms. Have you ever played the game Snakes and Ladders? It was invented in India. It illustrates *saṃsāra*. You go up on the ladders and down on the snakes. You're moving up, then you bump into a snake, and you're right down again.

So you stumble around, you get another ladder, you move up, crash, you're down again. This illustrates the Indian view of samsara. You're more likely to fall down than you are to rise up.

But one who is a mature student—and here "mature student" clearly means stream enterer—could independently declare, knowing it for themselves: "I am one who is finished with hell. I am a stream enterer, no longer tied to the lower worlds, fixed in destiny with awakening as my destination." I'm on my way, and I'm definitely getting there.

Now, you notice that despite the fact that the Buddha is being asked about students at every level of attainment, what he's concerned with is only to give an explanation for the first. And why is this? Possibly because this is the most common level of attainment, and therefore more people are concerned with it. But also perhaps because once the practitioner is clear about stream entry, then the higher levels of realization will also be clear, if in fact they arise. So it's the key. Understand this one and you'll get the whole lot.

Being clear about stream entry is central because once this attainment has been experienced, full awakening is guaranteed. The stream enterer is, as the texts say, "finished with the lower worlds." In terms of cosmology, the stream enterer will not be reborn beneath the human realm. As we've seen, for the Buddha, the human realm is the middle. It's between realms that are predominantly painful and realms that are predominantly pleasant.

Lower realms are so painful there's no opportunity for Dharma practice. Beings there are struggling just to survive. Higher realms are so pleasant that the beings there are dull and complacent. They're not motivated to take up the practice. And if you look at the stories about the devas in the suttas, by and large they're a pretty self-satisfied, dull bunch. They've got basically no interest in Dharma because they're so busy enjoying themselves.

The human realm is characterized by a mixture of pleasure and pain. Isn't that why we are here? Because we live a life which is reasonably evenly mixed. Some people do live in hell realms. A friend of mine who's a mature practitioner and also a clinical psychologist once described his job to me this way: he reaches down into the hell realms and tries to lift his clients up into the human realm. That's how he sees his work.

To be in the human realm—in this sense of a roughly even mixture of pleasure and pain, enough pain to motivate us, enough pleasure to not destroy us—to be in this position is very valuable, and from the Buddha's cosmology, rare. Only a tiny minority of beings are in this realm.

There's one story which comes to mind here. In the Buddha's time, there was a young man who got religion and ordained. He meditated fiercely and determinedly. But unfortunately, he was so dedicated to his practice and so ascetic in his approach that he ended up killing himself. He died, like the Buddha before he became the Buddha almost did.

And what happened was this: he's meditating away with closed eyes, and then he opens his eyes because his meditation is over, and he's looking at the most gorgeous woman he's ever seen in his entire life. She's gobsmackingly gorgeous. And he's surprised. He says, "Who are you?" And she says, "I'm your wife." And he says, "What are you talking about? I'm a bhikkhu." And she says, "No you're not. You live in that palace over there." It's a fantastic palace, full of gorgeous women. And then he looks down and realizes he's endowed with a perfect sixteen-year-old body, adorned with jewellery and fine garments. He looks at this, he looks at her, and he thinks, "Oh no, I've gone and died and I'm in heaven."

Now fortunately, he has the presence of mind—he's only been there consciously for a number of seconds, so he hasn't yet completely forgotten his previous life. And he realises he's in deep trouble. So he uses his deva powers to rocket down to earth and seek out the Buddha.

He says, "I've got a terrible problem. I'm dead, and I'm in heaven. What do I do?"

And the Buddha teaches him the Dhamma. And he gets it. He attains stream entry. And he goes, "Phew!" Off he goes. And right now he's enjoying himself, but he knows he's heading to enlightenment. It'll take a bit longer because he's got a bit of enjoyment to go through first.

So these are the kinds of attitudes that people had in those days. The Buddha is saying that one who enters the stream is guaranteed that their practice and their psychological state will never collapse to the point that they can no longer make progress. They will make progress—maybe slowly, if they're really slack in their practice, or if they take a detour through heaven; maybe quickly, if they're diligent—but they will go forward, to the point that the stream-enterer can say of herself that she is, quote, "fixed in destiny," unquote, with awakening as her destination. She's on a one-way street to awakening. And by the way, the Buddha describes this practice of satipaṭṭhāna as a one-way street to awakening.

So you can see why it's extremely important that practitioners be very careful in their estimation of their own practice. What if I mistakenly thought that I've attained stream entry? What if my teacher mistakenly thought that I've attained stream entry? What if my teacher mistakenly thought that he or she attained stream entry?

If it was me, maybe at that point I would become complacent and drift away from the practice. After all, it's not essential that I continue it—not in this lifetime. But if I'm wrong, then I will end up a lot worse than I was before. And if I became a teacher on the basis of this mistake, I could do a lot of damage. So it's important to get this right.

In another discourse, the Buddha and Sāriputta are discussing the state of the stream-enterer. Sāriputta is one of the two chief students of the Buddha, and he's foremost in wisdom. The Buddha says that people talk about "the stream." What is this stream that people are talking about? And Sāriputta replies that the stream is the Noble Eightfold Path. Then the Buddha asks, "Then who is a stream-enterer?" And Sāriputta says that a stream-enterer is, quote, "one who is endowed with this Noble Eightfold Path."

Think about the image of a path, which is really basic to the Buddha's way of talking about things. Sometimes a path is hard and steep. Sometimes it goes around in circles. Sometimes it's suddenly blocked by rockfalls or other obstacles. Sometimes it extends through difficult deserts. It's hard work walking this path.

Then think of the image of a stream. Entering the stream, I'm automatically carried downstream to its ultimate destination—the ocean, or in this case, full awakening. This is what the simile of stream entry suggests. The practitioner, or the practice of Dhamma, has turned a corner such that the end result is now inevitable. The stream-enterer is heading to awakening. It's just a question of time.

Now just as an aside, Mahāsi Sayādaw says that awakening will inevitably arise in part because, at this level of attainment, the practitioner realises for herself the nature of this practice, making her independent in this practice. This is really important.

Mahāsi Sayādaw says, "The fact is that a sotāpanna already possesses the know-how regarding the method of practice, which cannot be forgotten in any existence. It is indeed unforgettable because it is solely awareness of the nāma-rūpa phenomena arising within oneself."

It is not the sort of thing which has to be recited and memorized.

What Mahasi Sayadaw is getting at here is the essential simplicity of the practice. And at this level of attainment, this essential simplicity has become vividly clear. The Mahasi method, quote-unquote, consists of various techniques and practices, and we have been going through some of these. You notice that when we do these exercises, we jump through various meditation hoops—do this, do that, check out this, don't do that, and so on. But all of them are secondary to the basic principle of the practice, which consists, quote, "solely of awareness of the nama-rupa phenomena arising within oneself." In other words, continuous awareness of the flow of experience now. That's all. That's it. That is what Mahasi Sayadaw is teaching.

And once we realise the essence of the method, the method itself—the method as a method, as a technique—falls away. What's revealed is the radical simplicity of whatever is happening now. And this is not something that one can forget. One can, for example, go to another life and forget all about ever having done the Mahasi method, but it remains experientially clear that what's going on is a stream of phenomena. Now. That's it. That's what's happening. And this is the essence of the practice, which will never be forgotten, according to Mahasi Sayadaw.

Let us return to the Dhamma Mirror, the Brick Hall Sutta that we started with. What is that Dhamma explanation, the Mirror of Dhamma? This is the Buddha speaking:

"Here, a mature student has experiential faith in the Buddha in this way: This Blessed One is accomplished, fully awakened, endowed with understanding and conduct, well gone, the knower of worlds, the unsurpassed trainer of people with potential for training, teacher of gods and people, awakened and blessed.

He has experiential faith in the Dhamma in this way: The Dhamma is well proclaimed by the Blessed One—visible, immediate, verifiable, leading onwards, to be personally experienced by the wise.

He has experiential faith in the Sangha in this way: The community of the Blessed One's students has entered the good way. The community of the Blessed One's students has entered the straight way. The community of the Blessed One's students has entered the true way. The community of the Blessed One's students has entered the right way. That is, the four pairs of persons, the eight types of persons. This community of the Blessed One's students is worthy of gifts, worthy of hospitality, worthy of offerings, worthy of respectful greetings—an incomparable field of auspicious action for the world.

And finally, he possesses the virtues dear to cultivated ones—unbroken, untorn, unblemished, unflawed, liberating, praised by the wise, not clung to, leading to concentration, leading to samadhi."

So the Buddha speaks of basically two qualities that characterise the stream-enterer: experiential faith, with the objects of that faith being Buddha, Dhamma, and Sangha (which we won't elaborate on here as it becomes quite extensive), and virtues dear to cultivated ones—and these cultivated ones are the ariya.

Now why are these important? Let us start with faith. When we hear this, we might think of the stream-enterer as a convert—a person who has converted to Buddhism and therefore possesses complete faith. The early translators and commentators on the Buddha's teaching thought that was exactly what stream-entry was. They said, "Oh, this is obviously conversion, hence the faith business."

But the key to understanding what the Buddha is talking about is the idea of experiential faith. The stream-enterer has faith because she has directly experienced what the Buddha is talking about. Her practice has revealed to her a world that makes perfect sense, and within which she can live with satisfaction and well-being—a degree of satisfaction and well-being that was never available before, and perhaps not even imagined before.

She does not believe, quote-unquote, in this world, and she certainly doesn't believe in doctrines that can never be proved. She believes—if that's the right word—in her own experience. She believes in the undeniable facts of the way her life flows. This is experiential faith. And similarly, there is experiential faith in the Dhamma, the way things really are, and experiential faith in the Sangha, the community of practitioners. And of course, she is now a member of that community.

And then finally, the stream-enterer possesses, quote, "virtues dear to cultivated ones." Again, the cultivated ones are the ariya. We talked at the beginning of the retreat about this Indian term ariya, found in both Sanskrit and Pali. When the British came across this word, being themselves hopelessly racist, they assumed it was a racial term. But for the Indians, it isn't.

It's a cultural term, not a racial term. An ariya is one who is cultivated. And different communities within India would have different ideas of what constitutes cultivation. For secular society, for example, you would need to be fluent in Sanskrit. I mean, how can you be cultivated if you didn't know Sanskrit? And you would need to live according to your caste rules, and so on. There would be various things expected of you—roughly speaking, a gentleman or a lady.

But for the Buddha, the cultivated one is the mature practitioner. His citta, his heart and mind, is cultivated. So he possesses the virtues dear to cultivated ones—unbroken, untorn, unblemished, unflawed, liberating, praised by the wise, not clung to, leading to samadhi.

Now, what this is suggesting is that the mature practitioner has learned to live in a world in which it is abundantly clear that an ethical life leads to welfare and happiness, both for himself and for those around him. And this becomes obvious. When the sense of a separate self falls away, what arises is a natural empathy.

So the stream-enterer knows, truly knows, that if someone behaves badly towards him, he suffers. And it's equally obvious that if he behaves badly towards somebody else, that person suffers in exactly the same way. And so he won't do that. Because he looks at the suffering of other people and knows exactly how they feel. They feel the way he does. He looks at the happiness of other people and knows exactly how they feel. They feel like he does.

So there's a natural empathy that emerges which guides the ethical life. And this natural ethical stance is based on the stream-enterer's understanding of anatta, of not-self.

That is enough for tonight. Next week we'll continue our exploration of the dharma mirror.

A question came about how the realms the Buddha talks about relate to the Abhidharma realms. In the Abhidharma, which is the work of scholars systematizing the Buddha's teaching, the Buddha never attempted to create a system. What he did was wander around and teach this group of people what he felt they needed to know, then wander off and teach that group what he thought they wanted to know.

The way I look at it is this. One time, for my sins, I worked in the public service with a relational database. In a relational database you have a whole series of tables, each of them linked because one field in a table connects to another field in another table, and you end up with this complex web of information. You can go into the database, create the appropriate inquiry, and have a report spread out.

Now let's say you've got an incredibly complex, deep, subtle, and sophisticated relational database and you print out a report. Is that report the database? No. Let's say you print out a thousand reports. Is that pile of a thousand reports the database? No.

So the database is the Dharma, and it's held in the minds and the hearts of the Sangha, the sangha of practitioners. The Buddha never created a systematic system that would satisfy the requirements of an academic, for example, because he wasn't an academic.

So after he died, senior students got together and said, "What do we do about this? We've got to somehow preserve this teaching without him wandering around inspiring everybody." And so they created a system. They systematized it.

Now, in the case of these realms, you do get in the early discourses mention of various types of non-human beings, amanusa. But there's no systematic way of classifying them. And it could well be that the Buddha was in one area and the people there believed in certain kinds of spirits, and then he went to another area where those people believed in certain other kinds of spirits, and he just accepted it. So in the suttas it's more of a mix-up.

Later on, you get the system. For example, you get the thirty-one planes of existence. If you look at orthodox Theravada, you get charts that show all the planes of existence from the top down to the bottom. That's a product of the later tradition.

The concept is much looser in the Buddha's time.

A question arises: this teaching comes from twenty-five centuries ago, from a very different culture. Many of these things could be considered metaphors or understood to carry different meanings. How do we interpret some of these stories? They're incredibly colorful, but they come from a different place. How do they translate into twenty-first century Australia?

Well, they can translate, but we've got no idea whether we're getting it right. We don't know a great deal about ancient India. We know something, but we don't know a huge amount. But what we do know is the practice. And we do know that the practice instructions that have come down through the centuries work. We know this experientially, because we try it and it works. So that's what we know.

From that place of experiencing the practice, we can then look at the discourses, look at the metaphors, and we can read them, interpret them, in a way that makes sense to us. Are we reading them the same way that they were read two and a half millennia ago? It seems unlikely—the people were so different. But can we read them in a way that makes sense to us and gives us a coherent sense of the universe within which we can find our place?

This is what the tradition calls *loka*—usually translated as "world." But a *loka* is not just a world in the sense of a planet. It's a meaningful world. It's a world in which things hang together, and within which I can function because I have a role, I have a place, and this place is useful for myself and the beings around me. We use this heritage to create a *loka*.

When we're talking about the stages of awakening, for example, you can look at it psychologically and completely dismiss the cosmology. Say, look, the cosmology is nonsense, it's not scientific, forget about it. And it works. This is the world of secular Buddhism. Or you could look at it both psychologically and cosmologically and say, yeah, why not? Why shouldn't there be heavens above and hells below? There are people who have been reborn and who have memories of previous births. Why shouldn't there be rebirth? And just live in that world. Both worlds work.

So it doesn't really matter. The main thing is that we live in a world that is coherent and makes sense and gives us a role—something we do that makes the world better. If we've got that, then all is well.

Another question: talking about going up the ladder, as you go up, the numbers keep getting smaller and smaller. Rarer and rarer. And that's even within the Buddhist world. There's a whole bunch of other people out there who aren't interested, who don't have a clue. It's not even within their culture—they don't even know what the Buddha taught. So it's even rarer at the top. Who have you got to talk to?

That's even within Buddhism. Outside of Buddhism, maybe there's no one going up the ladder, although I suspect there are some. But at the top, who have you got to talk to? I'll even go for halfway. Even halfway? Who have you got to talk to? Well, I can answer that question when I get there. But until then, I'm just speculating.

The main thing, and this is actually the practical problem of Sangha—if you want a Sangha, if you want a community, if you're going to join a community, what you're looking for are people you can talk to about your practice such that they actually understand what you're talking about and have something useful to reply. That eliminates most of the world's population at a stroke.

Now, I shouldn't say this, but you'll never hear it elsewhere. For example, my brother. For the decades that I've been involved in Buddhadharma, not only has he never shown the slightest interest, but he has shown every indication that he doesn't want to know anything at all about it. So if we're having a chat on the phone—we keep in touch

—and he says, "How are you going?" and I say, "Good," he's happy. But if I say, "Oh, well, I was just teaching this retreat and..." he'll say, "Oh, that's good," and change the subject. Impossible to talk to him about these things. And he's not alone.

That's why you need a Sangha.

CHAPTER 42

Tracking Heart-Mind (Workshop)

Patrick Kearney · 48 min

> *In this workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney examines citta—the third foundation of mindfulness—explaining why 'heart-mind' captures both the cognitive and affective dimensions that the traditional translation 'mind' often misses. Drawing on the Satipaṭṭhāna Sutta (MN 10), he explores how the Buddha introduces citta through its colorings of obsession (rāga), aversion (dosa), and delusion (moha), the three fundamental movements that constitute our basic human problem.*
>
> *Kearney offers a detailed practical approach to working with disturbing emotions as secondary meditation objects. Rather than trying to solve emotional problems or getting caught in narrative content, practitioners learn to locate emotion in the body and investigate its elemental qualities—heat, hardness, moisture, texture—beneath the surface sensations. Using anger and sorrow as examples from his own practice, he demonstrates how emotions are complex phenomena involving body, vedanā (feeling), and mental narrative simultaneously.*
>
> *The talk addresses how direct awareness of emotion's impermanence weakens identification, leading to what Kearney calls 'emotional fluidity'—where emotions flow naturally without creating stuck patterns of self-construction. He candidly discusses the challenges Western practitioners face compared to Asian meditators, the economic and psychological barriers to intensive practice, and clarifies technical terms like saṅkhāra and the relationship between citta and vedanā. Throughout, he emphasizes that the work is done in the sentient body, not in the stories we tell ourselves.*

So these morning workshops and talks, we've been going through different aspects of the practice, working our way through the four Satipatthanas.

The first one is body. We start with body, and we spent a fair bit of time talking about and playing with our relationship to body. We moved on to vedana, feelings. Then yesterday we started working on citta, classically translated as mind. Yesterday we looked at one cognitive aspect of mind—the cognitive aspect that is concerned with thought, perception, understanding, and so on. We looked at thinking in particular.

Today we're going to look at the affective aspect of mind, which is about feeling in our normal everyday sense of the word, and emotions. Again, we're doing it in the structure of grounding object and secondary object. The grounding object represents

where our awareness makes its home—where we stay, unless we have a reason to go somewhere else. Our secondary object represents how we work with distraction, how we work with whatever pulls us away from our grounding object. In other words, in most cases, what presents to us as a problem.

Now that we're coming to the affective aspect of mind, we're going to look at it from the perspective of working with disturbing emotions that can arise as a distraction, as a problem. For some people, disturbing emotion can be a major distraction. For other people, not so much. But if it does present as a difficulty, then we need to know how to work with it. This is what we're talking about today.

We'll start with defining our terms. This third satipatthana is what the Buddha calls citta. The classic translation for citta is mind. Citta plays a crucial role in the practice because when the Buddha talks about bondage or hindrance or fetter, what is it that is bound, hindered, fettered? It's the citta. When the Buddha talks about liberation, awakening, what is it that is liberated, awakened? It's the citta. So it's quite central, and of course it's also one of the four domains of mindfulness.

Classically citta has been translated as mind, but this can easily give us the wrong idea about what it actually means. If you come out of the Western tradition, then mind is regarded as the center of rationality. This comes out of the ancient Greek tradition where the Greek philosophers debated among themselves: What is it that makes the human species different from other species, and of course superior? Well, it's reason. Human beings have reason; other species do not. And it's the possession of reason that makes us superior. Where do we look for reason, rationality? In the mind. This attitude permeates our culture today.

I suspect that for most people, if you ask them what the mind actually does, they'll probably say it thinks. And if asked to point to where the mind is located, they would probably point to their head. In fact, in normal conversation—even normal learned conversation, academic conversation such as you get on programs on the ABC—people often use the terms mind, head, and brain interchangeably, as if they're the same thing. I've always found this astonishing. But this is quite common in our culture.

The Buddha is coming at it from a different direction. For the Buddha, citta is the center of rationality—so he agreed with that. But for him it's also the center of mood and emotion, the center of affect. Most people in the European tradition would call this the heart, and would tend to place it, in terms of a hierarchy, beneath mind. But for the Buddha, citta equally embraces both head and heart. It's both, equally.

Overall, citta is a technical term, and it's one of those multi-layered technical terms. If you look up the Pali-English dictionary—the old one, which is the one I've got—four big pages, small print, and the entry for citta goes on for several pages. When you see that, you know you're dealing with an important technical term.

And it gets variously defined, depending on context. As Buddhist philosophy developed, the understanding of what exactly is meant by citta also developed. But in its broadest sense, citta essentially refers to our inner state, what's happening within us.

One way of looking at it is that we notice there are certain aspects of our experience which are public, and certain aspects which are private. For example, if someone happened in the course of casual conversation to say, "It's really hot this morning, isn't it? The sun's just blasting down. This is the hottest summer day we've had in the retreat so far," you'd look at them and think, is this person having a go at me? Because it's pretty obviously cool and wet. And we can all agree on that. In other words, physical experience is shared, it's public. There's generally a consensus that we just take for granted.

But of course, what I think about the weather at Medlow Bath—that's private. No one knows what I am thinking. Phew. What a relief.

We completely take this for granted. There are aspects of my experience which are purely private to me. And if by some accident it somehow leaks out, I'm often very embarrassed. "Oh my God, they've found out what I really think about this."

So citta refers to that internal, private realm. And it's in this realm that thoughts and feelings and perceptions arise. Does that make sense?

Citta can be translated as "mind," and sometimes that's a good translation. In certain contexts it could be translated as "heart," and sometimes I do translate it that way, when it's clear that the affective dimension is being emphasized. Personally, I think the best translation would be "soul." But I don't use it because the word soul has been taken over by Christians, and if you use it, there are all sorts of theological implications associated with it which just get in the way. So we have to leave soul to them.

Often these days you get the compromise term "heart-mind." I think that's become increasingly popular because it covers both the affective and the cognitive. So generally, that's what I use.

As far as I can see, the way the term "soul" was originally used, it comes from the Greeks. In Latin translation, the anima or the animus, depending on male or female. I don't know the Greek term. But Aristotle, for example, wrote a book on the soul, and

that's his book on psychology. So soul is the inner person, and it's not restricted to the rational. It's much broader than that. When we use it non-theologically, we include the feeling aspect. "The music was very soulful"—so it includes the affective aspect. It's in that sense that I think soul would actually be the best translation for citta.

Now, when the Buddha introduces citta in the Satipaṭṭhāna Sutta, first of all he doesn't give it an exact definition. He's not using it, I think, as a precise technical term. He's using it in a general sense. And when he introduces it in terms of the practice, he talks about the practitioner understanding whether or not the citta is colored by obsession, aversion, or delusion.

These are the three fires or the three poisons that we talked about last night. They constitute the fundamental movements of the mind, of the citta, and they constitute the basic human problem that we've got to resolve if we want to live a satisfactory life. So what is the fundamental coloring of my heart-mind as it presents now? This is the way that he introduces it in the Satipaṭṭhāna Sutta. And we can see that heart-mind, that citta, is very close to vedanā.

They're very close in their meanings. And in fact, in practical terms, from the point of view of the practitioner, it may be impossible to tell the difference between citta and vedanā, between heart-mind and feeling. Sometimes any given experience could be equally labelled either one or both. But it's not important what label we give to the experience. The important thing is that we are intimate with the experience. So in this case, whether we have an experience of our inner self and we label that feeling, or whether we label that our mind, doesn't really matter. They are very, very close to each other.

Now this brings us to the subject of emotion. As we said, when we start the meditation practice, there's a great deal of emphasis on the body. We've got our particular meditation objects and we're chasing after them. We may tend to ignore or push aside the arising of any kind of strong affective feeling emerging. Practitioners often stumble into the heart-mind, the tracking of the heart-mind, when they become aware of disturbing emotions that distract them from their practice—fear, anger, anxiety, irritation, desire, and so on.

Just out of interest, has anybody here during this retreat ever become irritated by their fellow meditators? It's not unusual. These are examples of citta, of heart-mind, coloured by obsession and aversion.

Some emotions have a flavour of delusion. I would say, for example, boredom. I find boredom difficult to note, difficult to be aware of. The delusion flavour for me is found in its restlessness and the vague sense of dissatisfaction and not knowing what to do about it. For me, these are all flavours of delusion.

Normally, the emotions that are easiest to notice, and once you find them, easiest to stay with, are those that are flavoured by attraction and aversion, or obsession and aversion. These are usually the easiest ones. And the ones that really grab our attention, generally, are the ones flavoured by aversion.

So how do we attend to disturbing emotion? The essence of the practice is awareness, and a basic principle of it is that it doesn't matter what we are aware of. What matters is the quality of our awareness. If emotion is present and if it is dominant, then emotion becomes our meditation object. We become intimate with how emotion presents—as we've been saying—without getting caught up in the content of the emotion, what the emotion is about, the story that accompanies the emotion. We are not interested in that.

The other thing, closely related, that is worth keeping in mind for the context of this practice, is this: if we're working with emotion as a meditation object, what we are not trying to do is solve our emotional problems. That is not the agenda in the meditation practice. It's not that there's anything wrong with that agenda—it's a really good thing to do, and there are all sorts of ways in which we can do it. But when we come to the meditation, that's not the agenda. The agenda is only seeing and understanding the emptiness of emotion. The not-self quality of emotion. Emotions are not me, and they do not belong to me. They're just natural processes. They're just natural phenomena, and they come and go according to conditions. And that's it.

But in order to really discover this, we have to be intimate with them. Otherwise, we will construct a self out of them.

So let's begin with the fact that emotion is a very complex phenomenon. Actually, there's no word in Pali or Sanskrit that corresponds to the English word emotion. You just don't find it. And apparently, according to the Dalai Lama, there's no word in classical Tibetan that corresponds to the English word emotion.

Now this clearly indicates that ancient Indians had no emotions. No, I don't think so. The problem with the word emotion is that it's a catch-all. It's a collective term. And in fact, in English, it's a modern term.

So, for example, in Shakespeare, who has a vast vocabulary, you never find the word "emotion." It either did not exist, or it was so obscure that not even Shakespeare ever used it. The term was introduced in the 18th century and became dominant in the 19th century, part of the separation of psychology from religion—the birth of modern psychology. Psychology was classified as a science, which means it positioned itself a long, long way from religion.

But in the era before the emergence of modern psychology, who were the psychologists? Who were the people who dealt with a disturbed soul? It was the clergy. And the language of what we now call psychology was strongly influenced by theology. So when people started inventing this new science of psychology, they wanted to distance themselves as much as possible from that heritage. One of the things they did was create their own vocabulary, and one word they created was "emotion."

But it is a catch-all. And I think the reason why there's no equivalent in the Buddha's language for emotion is that the term is just too vague, too general for him. His language is quite precise. His project is often to take a given behavior or a given set of circumstances and break it down into its parts, then see how those parts connect. For example, with the body, he examines the elements, breaking things down into their elemental parts, and then seeing how they connect. He brings the same kind of project to the mind, to the heart, to the citta. And "emotion" just doesn't cut it, because it's just too broad.

Emotion is complex. It's made up of different parts, and it involves all the satipaṭṭhānas. Take, for example, the emotion of anger. When I talk about emotion as a problem, the emotions I normally discuss are anger and sorrow. These are the emotions that I tend to address in the context of meditation because these are the emotions I wrestled with during my practice.

Anger I understood to some degree. But sorrow—sadness, misery, grief, despair, depression, melancholy—I really had to work with these. So I talk about them because these are the ones I've been practicing with the most.

Let's take anger as an example. We cannot have anger without tension in the body. If our body is completely relaxed, it is impossible to be angry. So there's an inescapably physical aspect to emotion—it's part body, part physical. And since all body sensations have physical location, this means we can speak of feeling emotion in our body. We might feel it in our heart, or in our gut, or somewhere else. Usually people feel emotion somewhere in the torso area. So there's a physical aspect to it, some kind of response in the body.

Now, I'm speaking as someone who is completely ignorant about Western psychology. I've never studied it. I've never had the slightest interest in it. So if I'm technically wrong, that's, as far as I'm concerned, perfectly understandable. But to me, the way the word "emotion" is used, emotion always has a strong feeling charge. And it's either pleasant or it's painful.

Some emotions are pleasant and some emotions are painful. I find it difficult, if not impossible, to think of an emotion that is neither painful nor pleasant. Mood, certainly—mood would fit into that third category—but not emotion.

In the case of anger, for instance, anger can be experienced as pleasant and it can be experienced as painful. In my experience, it's pleasant when it gives me a sense of power. If I'm really pissed off, then I run the fantasy of marching over there and smashing through and doing this and that. That sense of power is very pleasant. But anger is acute and painful when it's accompanied by a sense of powerlessness. We have the expression "impotent rage"—very, very painful. So it can be painful, it can be pleasant. There's the vedana, the feeling charge. Emotion is part body, part feeling.

And emotion normally includes a narrative in the mind. This narrative, this story, provides the intentionality of emotion. For example, if I am angry, I am angry *at* someone or some situation *about* something. This intentionality appears as a story I'm telling myself in my mind—a story that paints me as the victim of some kind of injustice. So emotion includes the thought stream we were exploring yesterday. Emotion is complex, and when we work with it, we basically break it down into its parts.

Here I'll share what I've found useful in my own practice. In Burma, I found that the Sayadaws were not interested in working with emotion. They were interested in the fine-tuning of details—the rising and falling, the lifting, moving, placing, the coming and going of mind states.

Someone asked about states like compassion and grace, whether I would call those emotions. I think the word "emotion" is a bit vague—you could call them that. The Buddha calls them dhammas: qualities or states. Whether or not you'd call them emotions, who knows? From the Buddha's perspective, the main thing he's interested in is whether any given psychological event or state could be seen as wholesome or unwholesome. If it's wholesome, cultivate it. If it's unwholesome, abandon it. This is his fundamental ethical stance.

In the context we're discussing now—emotion as a disturbance that takes me away from the practice—then pretty much by definition it's unwholesome, and the job would be abandonment. But if compassion arises, well, that's wholesome. I could cultivate it, and in fact I could turn it into a meditation, as in the Brahma Viharas.

But again, the context here is emotion as a problem. The Sayadaws just didn't want to go there. If you stumbled into an interview and said, "I can't meditate, I'm just full of rage," the response would be, "Did you know that? Next, please." If you couldn't meditate because you were overwhelmed by whatever storm had hit you, they would simply wait for the storm to blow over and then start again.

So how to work with emotion is something I developed for myself. And since it doesn't come from the tradition as such, please feel free to dismiss it completely as being totally eccentric and not worthy of your attention.

What I found useful is making my meditation object the felt essence of the emotion as revealed in its elemental quality. Here we go back to the elements. When the Buddha talks about the elements—earth, air, fire, water—he talks about them only in terms of body. But I find them very useful in the context of citta.

What are the elements that characterize the nature of this particular emotion? I begin by locating the emotion in the body.

So where is it? And if I can't find any particular location, I just settle awareness in the heart area. Then I note, I'm directly aware—not the sensation itself, but I'm aiming at the sensation while going through it. Here a certain amount of imagination might be applicable. I go through the sensation looking for the felt elemental quality of the emotion that lies beneath.

So, for example, anger. I've found it to be usually hot, but sometimes cold. It's hard, energetic, restless, moving, dry, rough, sharp. And as I said, sometimes pleasant and sometimes painful. If I had to put a colour onto it, I'd say red.

In contrast, sorrow I've found to be cool, moist, even wet, soft, gentle, smooth—and often, very strangely, pleasant. There were periods where I really enjoyed my sorrow. At the time I thought this was really bizarre, but it was what was happening. If I had to put a colour on it, I would say blue.

So what's the elemental quality of the emotions? Where is it in the body? How does it present elementally?

Throughout all of this, what I'm not interested in—at all—are the stories I am telling myself. Now, that's where the interest and the awareness tends to go: the story of my life, the story about these people who are doing these things, the story of the tragedy of my existence. But I'm not interested in these stories. Again and again and again, I'm dropping awareness from the story into the body, into the sentient body.

The story tells me nothing useful, except it can name what emotion currently possesses me. That is the only useful data it presents. The rest is rubbish at best.

The work is done in the sentient body. It's not done in the stories. It's not done in thinking and perception. Thinking and perception come later; they're on top. What's underneath is the raw emotion itself. This is found in the sentient body. It's here that we find the sensitivity that is the center of the citta—the raw sensitivity which is being bombarded by sense stimulus and which is reacting to that bombardment. That's where the work is done. And the story is far, far away from that.

Is there any benefit in tracking those stories—not in great depth, but noticing when this happens and when it doesn't, so that one can then see patterns?

Yeah, that's where I hammer this: don't get involved in the story, because that's our addictive response. But sometimes the story can be useful in that it leads you in a certain direction. There might be a particular traumatic event, and the thought of it spontaneously pops up. And I think, "Oh, that's interesting. Where is this taking me?" Then it's a kind of—it's not an active thinking about it, but allowing the imagery to come up while staying with the sentient body and seeing what the sentient body is doing. The story is in the background, but the attention remains in the sentient body.

Sometimes I will find the story will go boom, boom, boom, boom, boom—bang! And I'm back into that primeval traumatic event. But I'm into it in a way in which I can clearly see its emptiness. I can clearly recognize in real time: this is not me, and it's not about me. It's just an event coming and going according to conditions. Because it's deeply buried, every now and again it pops up for air, as it were. It kind of waves, and then it disappears.

As we do this, what we can see is that what presents as an emotion changes. If I'm tracking this, I can see that at some point it ceases, it ends.

Now this is obvious, but normally we don't see the cessation of an emotion in real time. For example, I know I am angry, and then later on I realise that I have already calmed down. But normally I don't see the moment that the emotion ends. And often we

don't see the arising of the emotion either—we just recognize that we're already in it. Catching the arising is something we normally don't manage. In the case of anger, I just suddenly realize that I am already angry.

But with this practice, what we learn to see is the actual moment of cessation—in particular, the cessation. Now, we can be ambushed by the emotion, so we miss the beginning. We just realize, "Oh, I'm in it." Sometimes we see the beginning, but often we don't. We're in it. But if I track it, if I'm with it, then I see the moment it ends.

And when that happens, the emotion ceases cleanly, and it doesn't leave any aftertaste. Usually, after I emerge from a strong emotion, for some time my mood is disturbed in some way, and gradually that fades. But if I'm directly engaged with the impermanence of the emotion in real time, then I see it end, and in that moment it's completely finished. There's no aftertaste. It's like, "Oh, right, it's over. That's it."

What this does is weaken my determination to identify with the emotion. Seeing clearly the impermanence weakens identification. And this is how it leads to the perception of not-self. The emotion comes and goes according to nature, but I learn to not identify with it.

The result is what could be called emotional fluidity. I find that my emotions flow readily from one to the next to the next, and I don't get stuck in any of them—because I'm not identified with any of them. I'm not using them as a means of constructing an identity.

Normally there are particular emotions that I am identified with, and once they arise I feed them with my thinking, with my story, and I use them to construct an identity and a world. I'm stuck in the emotion, and it cannot express its natural impermanence. But if I just keep the awareness of the elemental flow of the emotion flowing through the citta, the emotions just flow naturally. I'm not stuck in any of them, and I do not create an identity from them.

And so emotions are experienced as empty, as not-self. When that happens, they are not problems—even the painful ones. They're not actually problems. They're just events. That's all. And they can be very interesting events, and they can teach us a lot about the nature of the citta.

You'll notice that this morning we're not doing any little meditation exercises. There are meditation exercises in which the student will be asked to conjure up an emotion—like, "Think of something that makes you really pissed off"—and then when the emotion arises, use it as a meditation object. But I have far too much respect for emotion to play with it like this. I don't do it, so I'm just talking about it.

To put it in contemporary terms, there simply isn't a market for it. It's too difficult. There's too much working world pressure. And Westerners are slower.

The Burmese teachers, early on at the Mahasi centers, concluded that when people come in for retreat, the recommendation would be two months, perhaps extended to three. This was for Burmese practitioners, and that was plenty of time for them. Then they started teaching Western students. Oh my God! For a start, their minds never shut up. The emotions are rampaging, and the sense of entitlement is completely out of control. It takes them a lot longer.

When I was there, my impression—and this is purely subjective—was that it took maybe ten months to get through. If someone completed the practice in two or three months, they were remarkably quick. And usually people come back. You do a three-month retreat, you go away, you return next year for another three-month retreat, you go away again, you come back for another one. Eventually, you get there. The amount of commitment involved is great, especially for us.

I have been teaching in Malaysia, where the students are Chinese. These are thoroughly modern people. Often Westerners assume, "Oh yes, the Asians—they're all just peasants, aren't they? Mindlessly growing their rice, so they find concentration easy." No, no, no. These are urban, middle-class, highly educated, very hardworking people. But they find samādhi much easier than, for example, Australians. Much easier. And they're much faster to develop it. There are exceptions, of course. But for us, in contemporary Western culture, it's really hard. Because, basically, we are, as a collective, deeply disturbed.

"I still would like the opportunity to fail," someone says.

Absolutely. You should give it a go. There's no reason to think you can't do it. You've just got to commit fully.

Places like Spirit Rock and IMS are attempting exactly this—making deep practice accessible to Western practitioners. At IMS, they hold a three-month retreat every year. That's a huge undertaking. To have maintained that year after year, decade after decade, is a significant accomplishment. How often do you get a three-month retreat in Australia? You rarely even get a month. It's unusual.

"It's the money," someone observes. "You mean if I have more money, I can get enlightened faster?"

No, but financial pressure is one of the things preventing people from committing three months. When I started practice back in the seventies in Australia, the Aussie dollar was more valuable than the American dollar. When I went to Hawaii in 1980, one Australian dollar was worth $1.15 US. So it's become more expensive. But beyond that, the career pressure is greater. In my day, people would confidently walk away from a job, spend whatever time they needed meditating or wandering around Asia, return maybe years later, and be confident they could walk into another job and proceed to have a comfortable middle-class lifestyle. These days, you can't. You'd never buy a house.

If you get off the treadmill for five seconds. So economically it's much harder than it was. And psychologically it seems to be much harder. There seems to be more disturbance in the citta than there was before. So it's getting harder.

Going back to anger—sometimes I can see anger being energetic and almost life-giving. And sorrow can be so heavy that life can start feeling really impossible. And it's not always. But is that an okay perspective?

Oh yeah, I mean that's your experience and it sounds very authentic. The challenge then would be to stay with the heaviness or the sense of being drained or whatever flavor it is. The challenge is to make that a meditation object. Again, dropping the story, dropping the identification. And when working with really strong emotion, you let the body do what the body wants to do. So if the body wants to walk out and scream at the universe, go out and scream at the universe. If the body wants to roll around and weep, roll around and weep. But just keeping the awareness going all the time.

Not to nitpick at all, but just out of interest—you're talking about emotion being a catch-all and too vague. Wouldn't you also argue that citta is a catch-all?

It is, definitely. And later on, in the later Buddhist tradition, it gets very precise definitions. They kind of try to pin it down. But I think it's actually less useful when they do that. It functions better as a catch-all.

In the khandhas, the five aggregates, the term "mental formations" is often translated —

At this point we get technical. The Buddha creates this framework of human experience. The two frameworks he uses are the five aggregates and the six sense fields. Sometimes you use one, sometimes you use the other. With the five aggregates, the five collections, the fourth is sankhāra khandha. Sankhāra is another one of these multilayered technical terms that can be variously translated depending on context.

Literally it means construction or formation. It comes from the root *kr*—to make, to do—from which we get the word *karoti*. And the word karma comes from the same root. And you get *kāra*. So, for example, a carpenter or a builder would be a house-kāra, one who makes a house. Sankhāra is *kāra*—making—and then you have the prefix *sam*, together. So, to make together, to put together.

It refers to anything which is put together, anything constructed out of parts. So for example, this body is sankhāra. This building is sankhāra. This retreat is sankhāra, because it's put together out of parts. And as part of that understanding, anything that's put together out of parts, at some point it collapses and goes back into its parts. So it's impermanent.

This is the fourth khandha. So the question is, what is the Buddha getting at when he uses this? What does he mean by sankhāra here? It's generally understood that the Buddha himself saw this one as being essentially what we're going to talk about tomorrow—choice, intention. Because choice or intention is what constructs our life. So this is the constructing aspect.

But then in the later Theravada, when the scholars were systematizing everything, they looked at these five khandhas and thought, "It's a bit untidy. It would be best if it included everything, not just these five aspects of what we identify with to construct a self." So they used the fourth one, sankhāra khandha, as a catch-all for everything other than the others. They just put it in. And that's where you get "mental formations."

So you get two different ways in which this five aggregates model is used: the way the Buddha uses it, and the way the later tradition uses it. Body, feeling, perception, sankhāras, and awareness.

And we're going to be talking about the aggregates and the self later on in the retreat.

Sankhara is the Sanskrit term; sankhata is the Pali. They're the same word in different languages.

We've wandered rather far from our original point, but it's been quite interesting. Thank you very much.

CHAPTER 43

Tracking Choice: Cetanā and the Movement of Awareness

Patrick Kearney · 1h03

> *In this profound dharma talk from a 28-day Satipaṭṭhāna retreat, Patrick Kearney examines cetanā—the Buddha's radical redefinition of kamma as choice itself. Drawing on the Buddha's emphatic declaration "I declare that choice is action," Kearney distinguishes cetanā from the English concept of intention, noting that for the Buddha, there can be no conflict between our choices and our actions—they are inseparable.*
>
> *Kearney illuminates how cetanā relates to other key Pāli terms around directing the mind: sammāsaṅkappa (right intention) from the Noble Eightfold Path, adhiṭṭhāna (determination), and saṅkhāra (construction). He explains that tracking choice in meditation means recognizing the impulse to act, feeling awareness move toward its object, and understanding that what we experience as 'self noting something in the world' is actually just the choice to aware and whatever appears in awareness—the fundamental dyad of nāma-rūpa.*
>
> *The talk addresses the relationship between choice and conditioning, clarifying that while all choices are conditioned within paṭicca samuppāda (dependent arising), this doesn't preclude working skillfully with them. Habits remain habitual choices, and where choice exists, alternatives remain possible. Kearney offers practical methods for investigating cetanā: observing changes of posture, noting intention before movement in walking meditation, and using adhiṭṭhāna to catch the arising of thought. He emphasizes that even failed attempts at catching choice succeed in refining our aim, and that mindfulness in everyday activity—not just formal sitting—is the essential practice for transformation.*

This morning we're going to talk about cetanā, usually translated as intention. This brings us to the subject of kamma vipāka—action and its ripening—which of course is central to the Buddha's teaching on ethics.

This doctrine of kamma (in Pali), karma (in Sanskrit or English), is a teaching that the Buddha inherited, one that was part of the Indian tradition at the time. But he gave his own particular spin on it. He says, "I declare that choice is action. We perform actions of body, speech, or mind after choosing."

Here I'm translating the Pali cetanā as "choice," although it's usually translated as "intention," and kamma is, of course, action. You'll notice the sentence begins with the Buddha saying, "I declare..." When he phrases things this way, it's a kind of emphasis. He's being emphatic. It's like he's saying, "This is serious, pay attention."

So choice is central for the Buddha in working out how we live. It's the basis of kamma. And if this is so, then as practitioners, we need to become sensitive to the choices that we're making and the results of those choices. We need to become aware of them. To put it in terms of meditation method, choice becomes a meditation object.

In different parts of his teaching, the Buddha uses a number of technical terms that center around this central concept of choice, intention, or decision. All of them involve where we direct the mind. In terms of meditation practice, we've been talking about directed awareness and undirected awareness—directing awareness, sending awareness somewhere. This is the foundation for the meditation practice, and different terms revolve around this concept.

For example, in the Eightfold Path we find sammā saṅkappa. This is the second factor in the Eightfold Path, and it's part of the wisdom group. Right view, right saṅkappa—these together make up wisdom. Saṅkappa is one of those words that gets translated in a whole number of different ways, which indicates that there is no English equivalent. People are casting about for the closest one. But in every case, the translations refer to the direction in which we send our mind.

Directing the mind can be seen from the most broad and general to the most detailed and specific. Consider the fundamental decisions of our lives: What career path will I take up? Who will I associate with? Who will I marry? Where will I live? These fundamental decisions send our lives in a certain direction. And then right down to the microscopic level: when we're meditating, do I direct awareness to the rising movement of the abdomen or to the thought which has just arisen? From one end of the spectrum to the other, what all these have in common is the direction in which we send our minds.

Sammā saṅkappa could be translated as "right intention." Sometimes you see it translated as "right thought"—I'm not quite sure why; I've never quite understood that one. In the meditation context, you could translate it as "right aim." And of course this is absolutely central to the practice that we're doing.

As Mahāsi Sayādaw says, the source of the practice—where it comes from—is choice or intention: the choice to be aware of something and the movement of awareness toward that something. When Mahāsi Sayādaw talks about noting intention, that's what he's talking about. He's talking about directly being aware of the choice to be aware and the movement of the mind toward the object.

From Mahāsi's point of view, what is the source of each action of noting or directly being aware? It's choice, it's decision—the choice made now to be aware of this. Notice that this is not effort as such. We're not trying to decide to be aware. We're simply choosing to be aware. We're making the choice. We're always making the choice. But we could choose: instead of being aware of this, I could be aware of that.

Effort comes later on. Effort appears as the commitment to continue this choice over a period of time—this particular choice. The choice to stay with the breathing, for example. The choice to open awareness out. And sustaining that choice over a period of time. That commitment—that's where the effort comes in. But the choice itself does not involve effort.

So choice sends awareness on its journey. And in the practice, we learn to recognize the choice itself, to feel the movement of awareness, and to recognize the object of awareness. This is all part of the tracking of choice.

As the perception develops, one thing it teaches us is that we do not have a separate self noting or awaring something in the world out there. We assume that's what's going on. But when we pay attention, we realize actually that's not going on. What's going on is the choice to aware, and then whatever appears in that awareness.

I am going to elaborate, but not this morning, because this takes us into the whole area of nāma-rūpa and the arising of insight. We're going to talk about it at night, because to get into it properly takes a fair bit of time, and it's so counter-intuitive to the way we normally perceive the world.

We perceive the world as: this is me, there's the world out there, and I'm choosing to aware whatever it is. But what the Buddha is saying is no—what there is, is the choice to aware and what appears in awareness. That's what it is.

So he doesn't talk about mind and body, although sometimes you see that in English translations. But that's a kind of mistranslation. What he talks about is nāma-rūpa. Nāma is mind, but specifically it's the activity of mind—mind reaching out to aware something. And rūpa is the appearance, what is awared.

Remember we started with thinking? The first exercise was: how does thought appear? Does it appear as words? Does it appear as visual images? Well, the appearance is rūpa. Something appears in the field of awareness, and there's the action of the mind aware of it. The Buddha is saying that's all there actually is.

Out of that we construct a world, and we construct a self within the world. But all of that is a conceptual construction, and it's happening within this process of nāma-rūpa.

A student asked for clarification, and I acknowledged: this is where the question of choice becomes challenging. When we think about it, choice seems to involve a self—someone who chooses. So perhaps "motivational drive" is better than "choice," because choice assumes a chooser, whereas motivational drive does not imply a motivational driver.

This is a problem we have in conceptualizing all this. It brings us into the whole area of what in the Western tradition is called free will. I've had people who are philosophically literate assure me with great confidence that at the center of the Buddha's teaching is the teaching of free will. And I've had equally good practitioners, equally philosophically literate, who have assured me with total confidence that the teaching of free will is entirely absent from the Buddhist teaching. Absolute confidence on both sides.

I think the problem is that the way free will is talked about always assumes a self making a choice. And it also gets tied up in theology.

But that's right—when people in the Western philosophical tradition talk about conditioning, if something is conditioned, then they assume that means it belongs to a realm separate from free will. So if the human being is conditioned, then you either get complete determinism, where nobody's making a choice anywhere and everything starts rolling on according to the laws of physics or whatever, or there is a chooser, but that chooser is outside the world of conditioning. You can't have a choice unless you have a chooser who's outside conditioning—which is the soul, of course. That's the way we tend to think about these things.

But for the Buddha, he doesn't think about it that way. He's got a whole different way of thinking about it. It's language, really. If you've found a phrase or a word that suits you, then you might stick to that—it's as good as any other. What might be helpful is thinking in terms of conscious choice, and perhaps creative choice. This is what we're going to get to.

This very morning I read a book called *The Power of Habit*—I really recommend it. This very subject came up in there. The statistics are that eighty-five percent of the decisions we make all day are habit. Another ten percent are situational—a forced choice

that has to be dealt with immediately. And there's just over five percent that are truly deliberate choices. Do we have free will? Perhaps five percent of the time. I think one way of looking at it is that the meditator's job is to increase from five percent to six percent, maybe to seven percent. Possibly as far as eight percent.

So just to sum up: are all choices conditioned? Yes—this is actually one of the confusing things from the Western point of view. The Buddha is saying that choice is conditioned. It's part of the system of conditioning. Choices arise because of conditions. But that doesn't mean we can't work on it. We can change the system of conditioning, influence the system of conditioning. But basically, all of samsara is conditioned.

One pair of terms the Buddha uses is the *sankhata* and the *asankhata*. The *sankhata* is the constructed, the conditioned. We've briefly talked about this. So for example, this body is constructed. This mind is constructed. This building is constructed. This meditation retreat is constructed. Basically everything is constructed except one thing—which you can't even call a thing. This is the *asankhata*: the not-constructed, the not-born, the not-become, and so on. And this is so mysterious that it's quite difficult; you can only talk about it in terms of poetic imagery. But that's what's outside the system of conditioning.

So we are working within the system of conditionings. It's like we're taking hold of it and conditioning ourselves to head in a certain direction—the path—such that we will stumble into the unconditioned. But we can't make that happen. This is quite important, I think, in the meditation practice when you're talking about the arising of insight.

Robert Aitken Roshi, my old Zen teacher, put it quite nicely. In Zen, meditation is zazen, and everything revolves around zazen. He once said that zazen does not bring about realization. Realization, when it happens, always happens as an accident. But zazen makes you accident-prone.

And that sums it up pretty much.

So we're working with the conditioned. If you're doing a meditation practice, you're conditioning your mind, moment by moment by moment by moment. That's the work of it. So it's still within the realm of the conditioned. But if the citta is ripened, then by accident—click—it can stumble into the unconditioned. But you can't make that happen. And then, once there's been an immersion in the unconstructed, in the unconditioned, this begins to filter back into how the conditioned works. So the conditioned world begins to change as a result.

So we got very metaphysical there. Getting back to what Mahasi is talking about: we make a choice to aware, or we have a motivational drive to aware, as the case may be. And this motivational drive sends awareness on its journey. So in the practice, what we want to do is to learn to see, to recognize this choice, this decision, this intention, this motivational drive—this whatever it is—to recognize it, to feel the movement of awareness, and to recognize the object of awareness. And as this perception develops, what becomes clear is that there's no separate self noting something in the world out there. What there is, is the choice to aware and whatever arises within the field of awareness. So what we take to be the world and to be real is made up of awaring and what we aware. And that dyad is essentially what there is in the realm of human experience.

Now there are other terms that revolve around this concept of choice, decision, intention. One of them is adhiṭṭhāna. If you've done Goenka practice, you'll be familiar with this. An adhiṭṭhāna is a determination, a resolution. So it's a deliberately created, strong intention or choice or direction to perform a certain action or for a particular experience to arise. And adhiṭṭhāna is used within the meditation practice—we're going to introduce it a bit later this morning. In Goenka, I think they have adhiṭṭhāna to sit without moving for an hour. But again, it's the determination: "Oh, this is what I'm going to do." So it's a deliberately creative choice or decision to send awareness in a certain direction, or to do a certain action, for something to happen.

And then in the five aggregates that we've talked about before, the fourth one is saṅkhāra khandha, where saṅkhāra is construction. In the schema of the five aggregates—which are basically what create our identity, the raw materials from which we construct an identity—saṅkhāra represents our choices that form or construct our identity. The choices that we make, again and again and again, that construct an identity. And this, of course, brings us to karma.

And then finally we have cetanā. This is the term that we're looking at today. Cetanā is normally translated as intention, but the way the Buddha uses it, I don't think intention quite fits the bill. For example, in English, we believe—apparently, judging from the way that we speak—that it is possible to act against our intentions. We have the saying, "The road to hell is paved with good intentions." You've heard that one? And you know what it's getting at. It's coherent, it's understandable. But for the Buddha, if he heard that, I think what he'd be hearing is the statement that our actions take us in one direction while our cetanā is heading in another direction. And for him, that's nonsense. It's incoherent. If our cetanā is heading in this direction, our actions are heading in that direction. And that's it. There's no way that there could be a conflict between them.

So there's a very tight relationship between cetanā and action—tighter than intention in the sense that we normally use the word. Intention, I think, is too wide in its meaning to capture what the Buddha means. Intention is quite general. So, for example, I'm walking down here to this room and I intend to give a good talk this morning. That's my intention.

And that makes sense, doesn't it?

But while I'm speaking, I am making multiple specific decisions. I'll look at my notes now. I'll look up now. I'll look in this direction. I'll look in that direction. I'll wave my hand like this to make a point, or I'll make a big circle with my hand to make another point. There are multiple individual decisions being made. That's the cetanā. This is what the Buddha is getting at.

And finally, cetanā goes a lot deeper than we normally assume intention goes. A classic example is our intention to think. Sometimes meditators feel oppressed, harassed by their thinking. They believe that if only they could stop thinking, then they could meditate, and their life would be better. Have you ever had that thought pop up in your mind? They feel trapped by their thinking. The experience they're having is not that "I am thinking," but that "thinking is happening to me."

Now, if we go to a meditation master and say, "I want to know how to stop thinking," and the meditation master says, "No problem. I know exactly what you can do, and the effect is instant." You say, "What? What do I do?" And they reply, "All you've got to do is stop choosing to think."

If you were having a really hard time on a meditation retreat and someone seriously gave you this advice, would you think, "I've found my answer at last"? Or would you think, "What the hell is this person trying to do with me?" You'd get really upset about it. If it was me, I'd get very upset.

But if we actually look at how the mind works—how can I stop thinking in my meditation practice? Very simple. Just stop choosing to think. That really is it. Because when we choose to stop, the thinking stops immediately. And it will not arise again until we choose to think. Then it will arise.

From the Buddhist perspective, our determination to think, the choices we are making to think—they go very, very deep. But fundamentally, it is a matter of choice. This is what meditators discover when they, in fact, stop thinking or even reduce the level of thinking.

And this brings us to what we've been talking about before: the problem of habit. Cetanā is part of dependent arising, paṭicca samuppāda, which is the basic framework for the Buddha's teaching. In other words, our choices are conditioned. They are the product of habit, and in turn they produce new habits. We are caught up in our habits and our addictions because we have constructed them from the choices we have made over a long period of time.

Actually, looking back, I can remember when I was a little kid and I made the discovery that whatever unpleasant situation I was in, I could catapult out of it immediately by creating a fantasy—and going into the fantasy. It was fantastic. It was magic. I remember one instance when I was walking home from school. There was about a couple of kilometres to walk, and towards the end there was a hill just before I reached home. Walking up that hill there was a big staircase. I always experienced it as hard work, and I didn't really like it. I can remember approaching the staircase and deciding, "Okay, I'm out of here." I went into a fantasy and came out of it about a block later, when I was already descending. And I thought, "That was pretty good. I've got to keep doing this."

And so, of course, as an adult, when I start meditating, it's obsessive.

I can't stop. It's a habit. But it's a habit I created. And I created it through making choice. What's the way out of the habit? Make the other choice. So habits remain habitual choices. And if choice is involved, which it is, there is always an alternative. You can always make another decision. This is why understanding cetanā is so important.

And we can also see how the Buddha's teaching is essentially optimistic. He's got a reputation as an old misery bag because he's constantly banging on about dukkha. But what he emphasises is that we can always intervene into the situation. We can always do something to make things better.

So, for example, the teaching of dukkha: pain is inherent to samsara. It's just built in. And the teaching says, and the meditator discovers, that we can never find a place of rest within samsara. Understanding this is part of understanding the universal characteristic of dukkha. Yet there is something we can do. And more intimately, there is something we are already doing. We aware this situation.

And awareing, as we've said, has a twofold quality. There's a sense in which we do not do awareing, because the mind is already awareing. Simply, that's what it does. And that's not a question of choice. But we can choose to be present to our awareing of, for example, pain, and not try to hide somewhere else. And this awareing is very powerful and very healing. So the sense of "there's always something I can do" is really central to the Buddha's understanding of the situation.

This is why I translate cetanā as choice. Bhikkhu Bodhi translates it as volition, and Thanissaro, I think, uses decision—he sees it as the decision to act. So decision is another possibility. But I'm just using choice.

Now, if you're practising and you want to aware cetanā, how does it present? Sometimes, and this is based on what people have said in their practice, sometimes it presents as an impulse. And the impulse can be physical or it can be mental. If it's physical, that means impelled by the body. If it's mental, it means impelled by the mind. So for example, the impulse to look at something, the impulse to reach for something, the impulse to listen to something, the impulse to think something. Have you ever noticed that impulse? That's where you find the choice.

And sometimes it presents as a decision between possibilities. Suddenly we're faced with a situation and we know I could do this, or this, or that. And I'll do that one. Now, that is incredibly quick, and often, usually, we don't notice it. But when we're meditating and we're a lot clearer, we can start to notice it.

So if we're talking about thinking in the meditation practice: have you ever had the experience where you're minding your own business doing the meditation, suddenly you slide into thinking and you don't know that you're thinking, and then there comes that moment when you know that you're thinking, and you're faced with a choice? I could get back to the meditation object, or I could just finish this off first. I think I'll just finish it off first. Have you ever gone through that? It goes incredibly fast, but it's a decision between possibilities. And we just made a choice. And if we chose to just finish that off, we've just put another layer of habit.

And finally, and this is what Mahasi emphasises, we can see choice as the movement of awareness towards the object.

We can feel, having made that choice, that awareness goes off to where it goes.

So if we're looking for choice, if we're going to incorporate this into the practice, where might we look? One classic instance that the tradition talks about is in changes of posture. Let's say I'm sitting in meditation and at some point—in a situation like this where basically I'm the one who decides when to end it—at some point I end the session and I move. Can I see the decision to end the session and to move? Or do I just move?

I might make a point of deliberately extending the normal sitting period until discomfort or pain impels me to move, and then see if I can be aware of the moment I make that decision. To catch that moment. That's one possibility.

Another possibility is non-routine movement, changes of movement. If I'm doing walking meditation up and down a track, for example, I'm standing and I am about to move. Have you ever had that experience in your meditation? How do you know you're about to move? I'm walking and I'm about to stop. How do I know I'm about to stop? This is where the choice or decision to move or to stop is located. This is where I might find it.

Sometimes you can tell that someone's practicing this in walking meditation, when they're doing the standing before the walking and they're looking for the decision to move. You can tell because they just stand there for an hour. They've got the spotlight on, waiting for this decision to arise, and it hides away and doesn't turn up. So weird things can happen.

We can also see choice in routine movements. In walking, I'm noting the movement of my feet or legs, or using the classic language of the Mahasi tradition, I could note the intention to move. In the classic slow walking meditation—the lift of the foot, pushing, placing—I could note the intention to lift, push, and place. The choice to do it. The number of choices involved in walking.

Yes, that's why I'm standing. So I'm actually choosing to stand, waiting for the choice to move. And this may explain why it never turns up.

It is tricky. You don't want to get too caught up in this. At this point you just start walking. It's very simple once you get it, but it can be very curly when you're looking for it. Because why are you looking? You're making the choice to look. The choice doesn't come. Or the choice to fight. Let's wait for the choice to arise spontaneously.

Question: What about when there's a strong outside stimulus creating a reaction internally? Is there cetanā in that?

It depends on how sensitive you are. If you can see in real time the stimulus, if you can actually see it in real time, then within that seeing there's the possibility of choosing: No, I won't do that. No, I'm not going to get annoyed by this. The mind will be annoyed, but I'm not going to lash out. I'm not going to respond. I'm not going to do my usual response.

But the annoyance arises, and that can become the object to watch. You can't choose to not have the aversive response. So part of this is recognizing: what is the field of experience within which I actually do have a choice?

The more habit there is, the smaller that area becomes. But the more habit is reduced, the wider the area. And it comes out in basic but important ways.

One time, years ago, I was teaching a retreat here, and one of the meditators was a young woman who had taken up meditation as part of her recovery from drug addiction. At the end of the retreat, she was just really happy because she had seen, really, really clearly, that it's her choice. She really saw it—that she's not the victim of circumstances beyond her control. It really is her choice. And she felt free for the first time in years. Very simple. But she saw it.

When you're working with choice, that's what you want. You want the sensitivity to what's going on in the mind so you see it—that moment, that turning point. Because if you see it, you can do something about it. But if you don't see it, there's nothing you can do.

A retreatant shares: "It reminds me of the first retreat I did with you. It was in the middle of winter in Victoria, a sunny couple of days. In the first two or three days, there was a blowfly in the hall. I'm surrounded by Buddhist meditators who aren't going to kill the fly. What do you do? Two weeks of this? And I would just notice it—the frustration, the annoyance, the fly, the annoyance. Then the fly went away after three days and it got really cold. Towards the end of the retreat, it got really sunny again and the fly came back. But my initial response was, 'Oh, it's back!' I would never have guessed that I would have a pleasant response to this previously very negative stimulus. You know, it was like seeing a friend."

Yes, we're seeing what's going on. When the awareness gets into the citta and you can actually see what's happening, then you're not driven. And then the possibility of something else arising is there. In this case, it was your old mate. Or as I used to say in Burma, being haunted by the flies and the mosquitoes and so on: "May all beings enter and be happy." I didn't really mean it at first.

There's something about the way the time it takes to form an intention is shorter than the time it takes to complete the action, so that you can be making the intention, sending off the impulse to do the action, and you're already on the second intention before the first one is complete. Could be. It's very quick. The mind is really, really, really fast. And that's one of the things that makes it so difficult to actually get in there and really see what's going on. A lot of what the mind does is simply invisible to us, in part because it's so quick that it's over before we even notice it. And we're already in the situation.

One of the effects—and this comes out in everyday mindfulness—let's say you're doing a retreat and you're developing better and better samādhi power, seeing deeper and deeper into the movements of the mind. You might think, "Well, I can do it now because I'm in the middle of a retreat and I've got the samādhi power. But what happens when I

go back to work?" What you find is that having seen it once, the mind now is sensitive to it. Even in normal circumstances—bang—you see things that previously you would have been completely oblivious to. It's just vividly there. Incredibly quick, but there. And a response is possible.

We're creating a sheltered workshop, basically, where we get the opportunity to go into aspects of human experience that normally we would not have access to. But once the mind goes there, once the mind recognizes, "Oh, this is what's happening," it doesn't forget. So it's available in everyday life. And there in everyday life, we cooperate with it by practicing mindfulness, awareness in everyday activity. We're present to whatever the mind will throw up—whatever insight, whatever understanding the mind will offer.

We're ready for it. We're ready to catch it.

So can those changes occur because you do the work here and they're there—can they get lost from not keeping up, from not continuing a sitting practice? Can that awareness of the changes in habits get lost through neglect? Can we allow the weeds to climb back over things?

They can. But I think what's crucial is mindfulness in everyday activity, not so much the formal sitting. It certainly helps if you have a regular meditation practice because that provides a stability that assists with the seeing and the understanding. But the most important thing is mindfulness in everyday activity—just being awake as I go through the day. That's the most important thing.

My colleague Emma likes to say that in this tradition, in this lineage, meditation between retreats consists mostly of guilt—guilt that I'm not meditating enough. And from her perspective, this is a complete waste of energy. Rather, just be aware of life as it unfolds.

And in fact, I've got students who are quite dedicated meditators. They come to retreats year after year, not necessarily with me but with other teachers as well—a decade, two decades, whatever. And during that period, they will confess rather sheepishly that they never meditate at home. They just don't do it. They never quite get around to it. Yet you can see their practice getting deeper and deeper, and they will say, "My life is transformed." Because they're practicing mindfulness in everyday activity. That's the key. That's why it's so important here, because you've got an opportunity to get into it. But that's the most important thing.

This is what Sayadaw U Tejaniya really hammers, really emphasizes. He's been out to Australia twice, and I did retreats with him in Western Australia. They were classic residential retreats, except that all the rules were thrown into the air. But it turned out,

according to his interpreter, that what he would actually prefer to do would be to have a retreat in which you have a central place and people come at night. They meditate and have group interviews, then go home. They go to work and do what they do. They come the next night, meditate, have a group interview, and go home. For him, that's more real—because every day, you're dealing with it.

I teach online retreats, and that's one of the advantages of that format. People will turn up in the Zoom room and then go back to their ordinary life, and come back to the Zoom room. People talk about how powerful it is, how practical it is.

The Mahasi approach is very much retreat-oriented—very much about going deep, deep, deep in order to transform everything. And although they pay lip service to everyday mindfulness, there's not really the emphasis on it, except with U Tejaniya. For him, that's the central thing.

But what we're doing here, we're doing for the purpose of when we get out. You can have a situation in which people create a kind of silo—the practice is what I do when I'm on retreat, with little reminders occasionally when I do my daily meditation practice. But no, the practice is the whole thing. And seeing the choices that we make is really central to that. What am I doing? Literally, what am I doing? Now. Being interested in that as I go through the day. I can take that with me.

I think that's why it's really useful to belong to a sangha.

Because you can support the network outside of you. It's the strength of the sangha, the first of the supportive factors. It's like finding right-minded, good people that you can meet with.

And this doesn't mean that in ordinary everyday life you're going to become some kind of super yogi. I've got a friend who is a longtime meditator, and his normal routine would be to meditate four hours every day. This is his standard practice. I mean, he gets up ridiculously early in the morning.

One time I was running a retreat here, and at the end of it, we were having a chat, and one of the perennial questions came up: "In my daily life, how much should I sit?" And I must have been feeling a bit frisky because I thought of my friend, and I said, "Oh, four hours is good." And the poor woman just completely lost it. But it was too late. I'd made the choice. The words had come out. I couldn't pull them back in again.

But we do have this sense that we're supposed to be the super yogi. I'm not supposed to be the super yogi. What I'm supposed to do is be aware. And there's nothing more natural than to be aware. What we're doing here is learning techniques. We're going deeper into it and we're learning how to play the game. But basically, it's really simple. Just be aware. That's it.

Shall we finish off? Because we've got one more esoteric meditation exercise to cover, which is thinking. The choice to think.

If you're interested in this, one way to play with it is doing walking meditation where you're using one of those tracks—in other words, you've got a set distance which isn't too great. You begin by standing, and then you make the adhiṭṭhāna, the determination: "From here to the end of this path, I will be aware. I will know the moment thought begins."

Now when you're working with adhiṭṭhāna, you make the determination, and it's like you just drop it into the mind, and then you forget about it. And then you just start to walk. At the end of the path, stop, stand, turn, and then review what happened just then. Did it work? Did it not work? And then make the determination again: "From here to the end of this path, I will note the moment thought begins." And off you go. You just go back and forth.

If you get comfortable with it, you could change the adhiṭṭhāna: "From here to the end of this path, I will not think." Same thing. At the end, review what happened. And the reviewing is very important, because this going back over the experience stimulates mindfulness, which remember means memory.

What people will say when they do this is that they don't necessarily stop thinking, but they become much more sensitive to the arising of thought. They catch it much sooner.

This brings us to the point that tracking choice or decision is a question of aim. And again, we've talked about aim—how important it is in practicing for insight that we practice aiming awareness to where we want it to go. We've been playing around with this with the elements, with breathing, and so on.

So when we're working with cetanā, instead of aiming awareness at the body, for example, we're aiming awareness at the stream of choices that result in the movement. It's quite subtle. Instead of aiming there, it's just over here. Instead of tracking the thoughts, we're aiming awareness at the choices producing the thoughts.

Once we recognize that this is a practice of aim, then we realize that even if we fail, we succeed. Because looking for choice cultivates our aim and our precision.

So it's like if you decide to take up archery. You pick up the bow, draw back the arrow, aim at the target, release the arrow, and the arrow goes plop—completely misses the target.

Now what would be the reasonable and rational response at that point? Possibly it would be to hurl the bow down on the ground, jump up and down on it until it's completely smashed, and storm off the range never to take up archery again. You could do that. Or you could think, "Well, yeah, my aim is complete crap because I've only just started." And you just keep going and see what happens. Over time, your aim will improve. It's just practice. That's all. So treat it as a game. You're learning to aim.

Let's say, for example, people who practice catching the choice to move when they're doing walking meditation—like the choice to lift the foot, the choice to push it, the choice to drop it. They might go through a number of sessions in which they're never satisfied that they ever caught any of these. But what they will find is that the movements themselves have become clearer because their aim is getting better.

In my case, I was instructed on noting intention when walking up and down. The Sayadaws like to do it within the first week of a retreat. Once people have settled down, I like to direct them towards intention. I always found it frustrating and somewhat embarrassing in the interviews, because whenever I was asked, "Are you noting intention in the walking meditation?" I would have to say, "No, Sayadaw, I never saw it. I can never catch it." This is embarrassing, particularly in Burma, because the interviews aren't private—people are lined up. So everybody knows I'm a failure.

This went on for years.

And then one day I was doing walking meditation before breakfast, walking up and down this hallway. And suddenly, there it was. It wasn't the intention to lift, the intention to push, the intention to drop. It was like within each of those micro-movements there was a stream of intentions. It was like a river flowing down a hallway. A stream of choices. And it was fascinating. It was great.

Next interview: "Sayadaw, I noted the intention in walking." And he kind of went, "Yeah, yeah, sure, sure. Next." He wasn't interested at all. Presumably because for him it's so routine.

Anyway, it was a brilliant success. And I decided I have mastered intention. And from that day to this, I have never seen it again. Not once, ever.

But I am sensitive to the intention to think. I've worked on that, and to me it's generally pretty obvious—while other people are the exact opposite. So you're always working with your own particular set of sensitivities. You don't worry about whether you hit the target or not, whether you can hit this target but you always miss that target. It's irrelevant. Work with the aim. And if you work with the aim, the whole thing will get better.

A student asked about being in a state where you're not aware of choices you're making with your body—where the body seems to be moving in a flow state, with no conscious decision around what's happening. Like playing an instrument, improvising, where what's coming up is constantly a surprise. There seems to be a pattern but you're not driving it. What is that? Is it a complete non-awareness of the cetanā, or is something else going on?

Well, there you'd be seeing the cetanā as the movement of awareness toward what you're doing. The awareness just knows to go there and to do whatever it is. So the cetanā would be in the movement itself—in the movement of awareness. Not necessarily through the mind, not through cognition. It bypasses cognition.

But this aspect of chaitanya—you can see it not just in the cognition, but in the actual movement of awareness. That's also the chaitanya. And I think that's why the Sayadaws actually introduce it quite early. They use the English word "intention," and that always creates confusion, because intention sounds like something very cognitive. But they're actually referring to something much more embodied—the movement of awareness itself.

You can have a sense of choice in the ordinary sense of the word: "I choose this." And sometimes it presents as that—it presents as a choice that is quite discrete, like a turning point, turning a corner. But sometimes you can feel it differently. That word chaitanya also covers having made that turn, having turned that corner, and then the awareness flowing in that direction. So the chaitanya includes the awareness going in that direction.

Sometimes you will see it as the awareness flowing in a certain direction, but without having seen the moment behind it—the "I think I'll try doing this one." You may not have seen the moment of determination, but you're conscious of the flow of aim or intention. This is what I didn't understand when I was in Burma—that this is what they were getting at—because of the English word "intention." And of course they never really explained it. You've got to be very sensitive and have the awareness just so.

One of the important aspects of this is to get a feel for the awareness flowing toward the subject. And in states of flow, I think you do get a clear sense of it. It's like the awareness is just going without the sense of someone at the back. Tremendous skill and expertise and refinement operate to do their work, but they've become invisible. There's lots going on in the mind, but what you've got is just the awareness.

The mind is really active in those moments. Sometimes words just pop up. How did I do that? But when the mind is really active and the samadhi power is there, all that activity disappears from experience. Because you don't experience that there's a mind doing this. It's just the doing. So this would be an example of not-self. The mind is operating in the background, but there's no self-awareness of it. It's just the flow, just the activity.

After you turn the corner, it seems like there should be one more step—a "how did that work out?" And yes, that's part of the teaching of karma: action and its ripening. And it's part of mindfulness—tracking the experience over time. Part of that is the monitoring, the reflection: how did that work out? This is all part of the package.

But in any given experience, some of it might be obvious and other parts of it may have vanished. You just don't see it. It depends on the individual circumstances. One of the advantages of the karma part is that it's not immediate. It doesn't have to be right then. It can be later on, when you've got time to reflect on what happened in all those processes. That's part of the teaching of karma vipaka—of action and its ripening. And the ripening could be instant, or it could be very long term, or anywhere in between.

And the mindfulness is monitoring the whole flow, all the way through.

But that's what the mind does. It monitors. It awares. It processes. It's incredibly active. But when it's really absorbed and just doing it, all of this disappears from awareness. We don't notice it.

It's like when you're talking to someone and you understand what they're saying. You're not constantly going back and reviewing your English grammar and vocabulary and trying to work it out. But in fact, that's what the mind is doing. When the mind is doing it smoothly, it disappears from view.

But if you try to learn a second language, you know how much work is involved—memorization of vocabulary, understanding the framework of the grammar, how to put words together, how to extract meaning. An unusual use of a term—what is it? Is this irony? Is this humor? What is this? An incredible amount of mental processing goes on just to understand when someone says something, and you think, "Oh yeah, I know what they said." All that processing vanishes. You don't see it. But it's there.

And when we're meditating, it's like we've got a spotlight into this immensely complex system. We're aware of just a tiny fragment of it. But what the Buddha is doing is saying: if we spotlight there, it will change the whole system. And the system will start to turn in a direction which is much more satisfactory to us. It will just do it, because that's nature.

"It seems like that's the point where a lot of failure occurs—where there is no realization that it didn't work out, and it becomes someone else's fault."

Yes. I think we have to somehow make meditation more efficient, because at the moment it seems to be very inefficient. I have to get a committee to work on this.

Okay, we're over time.

CHAPTER 44

Finding Right Effort

Patrick Kearney · 40 min

> *In this illuminating talk from a 28-day Satipaṭṭhāna retreat, Patrick Kearney delves into one of meditation's most challenging aspects: finding the balance of right effort (sammā vāyāma). Drawing from the Mahāsaccaka Sutta (MN 36) and Bhayabherava Sutta (MN 4), Patrick examines the Buddha's own pre-awakening struggles with effort, revealing how even Gotama himself fell into the trap of "crushing mind with mind" during his ascetic phase.*
>
> *Patrick explains how the Eightfold Path positions effort (vāyāma), mindfulness (sati), and concentration (samādhi) as interconnected qualities, with mindfulness serving to balance the active and receptive aspects of practice. He highlights a crucial distinction: while we cannot have too much mindfulness, we can certainly have too much or too little effort. The Buddha's mistake in his youth was allowing mental energy to overwhelm his body, creating agitation that blocked his progress—despite having continuous mindfulness and high energy.*
>
> *The talk addresses how striving for future results traps us in papañca (conceptual proliferation), pulling us away from present-moment awareness. Patrick offers practical guidance for exploring right effort, particularly recommending the lying-down posture as a laboratory for experiencing mental alertness with physical relaxation. He suggests following lying meditation with sitting practice to transfer this felt sense of balanced effort. The key insight: when we're fully committed to recognizing what's happening now rather than trading present experience for imagined future attainments, the body opens, the heart settles, and genuine progress becomes possible.*

Tonight we're going to talk about right effort, finding right effort, because the whole question of the effort that we make in meditation is a very vexed one.

When the Buddha talked about meditation practice in the Eightfold Path, which is his basic template, he talked about it in terms of three qualities that have to be cultivated: sammā vāyāma, sammā sati, and sammā samādhi. Sammā vāyāma, usually translated as right effort, could also be translated as right energy or right commitment. Then we have right mindfulness, and then right concentration or unification.

If you look at these three qualities, right effort or energy represents the active side of meditation practice. This is the "do it now, do it now, do it now" aspect of practice—the continuity of the practice without taking any break. On the other end, you've got right concentration or unification, samādhi, and this represents the peaceful, receptive side of meditation. Samādhi, concentration, unification, doesn't do anything. It's just stillness. Then in the middle sits right mindfulness, and it balances the two of them. One of its functions is balancing the active with the receptive aspects of the practice.

A great deal of the practice, like most of our experience, involves finding a balance between the active and the receptive. With sammā vāyāma, right effort, we can have too much energy and effort. This is where we get really tight and tie ourselves up in knots and eventually our head explodes. I do have an old meditation friend who once advised me that you haven't really seriously begun your meditation practice until your head explodes. So there's that aspect. And of course we can have not enough energy and effort, and this is when we're having a nice peaceful meditation spiritual holiday and nothing much is happening.

Notice the difference between that quality and the next one, right mindfulness. We can have not enough mindfulness, and if we don't have enough mindfulness, we're in trouble. But we cannot have too much mindfulness—that's just impossible. Vāyāma, energy, effort, commitment, that one we can have too much of, just as we can have not enough of.

Finding a balance between too much effort and not enough effort, too much energy and not enough energy—this is crucial for the meditator, and for most people it's quite difficult to find that balance. It can take a great deal of time and a great deal of experimentation to actually get it right. But if we're struggling with this, we can comfort ourselves with the thought that we are not alone in being affected by this problem. The Buddha himself had this problem, and in fact, he had it seriously badly. Tonight we're going to have a look at what his problem was, how he faced it, and how he overcame it.

We're going to do this by looking at two texts that are largely parallel. Each comes from a different discourse, a different sutta. Both of them show the Buddha speaking to his students, reminiscing about the bad old days before he was the Buddha, and in particular, when he was doing ascetic practices. In one of these texts, he describes the problem that blocked him in his practice. In the other, he describes the solution he discovered to overcome the problem.

Because we're talking about the Buddha before he became the Buddha, we shall call him by name: Gotama. He was an aristocrat of the Sakya Republic. Gotama was his family name or his clan name. In the early discourses, there's actually no mention of his

personal name. A number of the characters who appear in the discourses have that characteristic—we know their clan name, but we don't know their personal name. Sometimes we know their nickname, and sometimes we get a personal name. But in the case of the Buddha, we just know him as Gotama. That's how people who were not his students addressed him: Mr. Gotama.

As a young man, he left home in search of awakening. He did so because he thought he had a problem, and he thought that awakening or enlightenment would solve his problem.

So he went out in search of it. And clearly he must have been a pretty macho young bloke, just refusing to listen to anybody and determined to do exactly what he wanted to do, exactly in the way that he wanted to do it.

Anyway, he embarks on his meditation career and ends up going down a blind alley, as it were, getting stuck in his practice. At first he practiced yoga and meditation in what was then the Vajji Confederation, the largest of the tribal republics in North India at the time. Two or three centuries before, it had been the kingdom of Videha, and it was the center of yogic and Upanishadic teaching and practice. This is roughly what would be North Bihar state today. But it didn't work out for him. So he went south, crossed the Ganga, and ended up in the Gaya area in what is now South Bihar state. But again, a dead end.

Now, at this point in the South, he's doing extreme practices. He's part of an extreme ascetic tradition, which was quite strong in that area. Not only did his practice come to a dead end, but he almost came to death himself because he was abusing his body so much.

This brought him to a stop where he started to seriously reflect on what he was doing wrong, because he was clearly doing something wrong and his whole project was about to collapse. He thought about it, and he located his problematic relationship to the practice in terms of the stress that was brought on by it—in particular, the stress that he felt in his body.

Now decades later, when he's the fully awakened Buddha and a highly successful teacher who's built an international empire, this is how he describes the practice of his immature youth to his students. This comes from Majjhima 36, if you want to look it up, the Mahāsaccakasutta. He says: "Although I generated lively energy and established continuous mindfulness, my body was agitated and disturbed because I was overwhelmed by the painful striving."

This is how he sums up his practice then. It describes Gotama's approach to the practice in his ascetic phase. Notice what he's doing: he's striving for awakening. He wanted something. He wanted it really, really, really badly. He threw away everything that he had and gambled it all in order to get this one thing he really wanted, which was enlightenment, awakening. And he saw his body and his mind as instruments to get that something he wanted. He had a very instrumentalist relationship to his body and his mind. If he flogged his mind and body hard enough, he could drive them onwards to awakening and get what he wanted.

It's rather like the relationship a dedicated athlete has towards his or her body. Often athletes have terrible injuries because they've just trashed their bodies, driving them in order to get what they want. Gotama seems to have had the same relationship to his body and his mind.

So he's describing his practice and he says he had high energy effort, *vīriya*, and he had continuous mindfulness, *sati*. Two big ticks. He's doing really well—very high energy, continuous mindfulness. That's pretty good. But he's making a crucial mistake, and in his obsession, he's completely blind to it. The mistake is that the power of his mind is being used to overwhelm his body and drive it towards a goal. There's an imbalance between mind and body.

This comes about because, in terms of the meditation practice, when we talk about the path factor of *vīriya*—driving, effort, energy, however you translate it—these are mental activities. They are not physical activities. But in the way that he was pushing himself, Gotama's mental energy bled into his body, and his body became agitated and disturbed. In other words, he lost touch with the delicacy of the practicing mind, the mind that is doing the aware-ing. He lost touch with how delicate and sensitive that mind is. His mind was clear, strong, awakened—but his body was overwhelmed by agitation. His mind and body were at war with each other, and this war was the expression of his delusion.

A question came from the group: "If he had this really good mindfulness but was disconnected from the sensitivity of the body, isn't that kind of a gap in the mindfulness itself? Isn't that part of the work?"

Yes, it's part of mindfulness applied skillfully. But consider this: when you meditate, you can be really focused on something—let's say the breathing—and you're really absorbed in it. You're not noticing certain things, and therefore you're staying in the sitting posture for a long period of time.

And you don't notice that your left knee is screaming out in pain. So you're mindful of the meditation object, but you've blotted out everything else.

"So isn't that samadhi?"

It is, but samadhi is supported by mindfulness. Yet it's mindful of simply one part of experience, blind to the others—not the whole picture. When you focus on something, it can be like wearing blinkers, like shining a spotlight in a dark night.

"I thought the whole idea of mindfulness was that it kind of balanced things out."

Exactly. That's the mistake he was making.

"I don't understand why you can say he had good mindfulness if he wasn't actually —"

He said his mindfulness was continuous. But he didn't have what he later came to call sammā sati, right mindfulness. He didn't have what he later came to call sammā vāyāma, right effort. So in the path, he qualifies each of these qualities with "right" as opposed to wrong—because you can have them but completely screw up the whole thing, depending on how you're doing it, depending on your relationship to it. I think this is part of the reason why the Eightfold Path has that emphasis on "right." And in his younger days, he was definitely getting it wrong. But there's also the impression that he was not a man to actually listen to anybody else. So he had to make the mistake.

Now, this is a rather extreme example. Again, I get the impression he was a pretty extreme young character. But this is the problem we have when we struggle in our practice.

The practice demands effort. Many years ago when I was resident teaching here, sometimes people would ring up and say, "Oh, we hear you're a Buddhist meditation center and we'd like to come up and just meditate for a while." "Oh, we don't want to join an organized retreat. We just want to come up and meditate." "Okay, are you an experienced meditator?" "Oh yeah, I've done a bit." "So what do you think you would be doing when you're up here?" "Well, I thought, you know, me and my girlfriend could give each other massages. We just relax, and you've got vegetarian food." Basically, they wanted a spiritual holiday. Because this is what they thought meditation was.

The practice does demand effort. And sometimes, if people expect to spend a meditation retreat relaxing, they get a complete shock when they actually come here and start doing it. The problem is that if we're working really hard and making great effort, we

end up feeling stressed. And when we're stressed, we cannot settle. We're agitated. We might be suppressing the agitation through our effort, but we're agitated. And this agitation gets in the way of the practice.

The way Gautama articulated this problem was: How can we make mental effort with the body relaxed? How do we do that?

When Gautama worked out the solution to his problem, this is how he expressed it. This comes from Majjhima Nikāya 4, the Bhaya Bhairava Sutta. He says, "I generated lively energy and established continuous mindfulness. My body was calm and peaceful and my heart was settled and unified." This is one occasion where I would translate *citta* as "heart" because I think it fits.

So at this point his mind had high energy and mindfulness as before. Now, this involves a highly active state of the mind. Highly active. When we develop samādhi—let's say we really start to develop samādhi concentration, the mind really settles, becomes still, very clear—it's very peaceful, and it's easy to miss that this is actually a high energy state. But the energy is flowing completely freely, and so it just disappears. It vanishes from view because there's nothing disturbing it.

So his mind had high energy and mindfulness, while his body was calm and peaceful. This is a very interesting state of balance, because this is what we're trying to achieve. We want an active, energetic mind in a body that is calm and peaceful. This is a big challenge for anybody, and it's something that, as practitioners, we need to explore in our practice.

So what's central here is the interconnection between mind and body, the networking between them. We want the mind to put out maximum energy while the body relaxes, and therefore does not distract or get in the way of mental activity.

To understand what this means, let's look at a very mundane example of when this does not work—when body and mind are feeding each other's stress.

Let's say you're doing something very simple, everyday, straightforward—something physical with your hands, like buttoning a shirt. And let's say the context is that I'm buttoning my shirt because I've got to go out somewhere where I have to look respectable, and time is short. I've got to get out the door soon. So I'm doing it perfectly routinely, except for that last button. And that last button is recalcitrant. It will not go into the buttonhole. Have you ever had buttons like that? Buttons that turn on you?

So I'm getting frustrated as I'm wrestling with this button, this final button. My energy rises. I try harder to get that button into that buttonhole. But the very act of trying harder causes my awareness to slip away from the physical delicacy of touch sensations in the hands and fingers, which is where the work is actually being done. The awareness slips into the mind, into an inner determination to smash through this job and get it done.

Stress pushes awareness away from the body into the mind, and that mind is becoming increasingly agitated and frustrated. This determination to get the job done is expressed physically throughout the body as tension and hardness, and it's expressed mentally as a separation from the actual physical activity—into an inner sense of frustration and striving. Mind and body are fighting each other in a kind of vicious feedback loop. Each is feeding the stress and tension of the other, and the whole situation is rapidly escalating.

Now, if we get back to meditation—have you ever found yourself struggling in your meditation practice?

Let's say I am struggling in my meditation. How do I experience this sense of struggle? Well, in part it's a sense of hardness and pushing in the body. There's tension throughout. Sometimes in breathing meditation, it expresses itself by the breathing itself becoming much stronger and harder. We might discover, for example, if we're in the habit of struggling in our practice, that we have a special meditation breath. My breathing is operating in a certain way, I sit down, construct my meditation posture, decide now I've got to start meditating, and immediately the breath goes zoom, zoom, zoom—loud and clear. This is my meditation breath, which is actually harder and more escalated than my normal everyday breath. And as soon as I decide "that's it, I'm getting out of here," my breath calms down. Has that ever happened? Maybe it's just me.

The physical sensations in the body which indicate stress are signaling back to me that I am trying hard in the practice. And that must be good, surely. So I should keep going. But my mind has lost its engagement with the present—partly because it's overwhelmed by the distress signals from the body, and partly because it's taken over by a concept, a concept of a future result, of what I'm going to get out of this sometime in the future. Basically, my attitude to the practice becomes "I have to get from here to there"—from here, which is bad, to there, which is good—and as soon as possible. The days are ticking by. I've got to generate that samadhi.

But if the body is relaxed while the mind is working, then mind and body come together in a harmony which one can feel. There's no threat. There's no danger. There's no stress. There's just something to be done. Body and mind settle together. And when that happens, the heart opens.

Remember what the Buddha said: "I generated lively energy and established continuous mindfulness. My body was calm and peaceful and my heart was settled and unified." This is the samadhi aspect.

In other words, in wrong effort we have a two-fold process. In right effort, it's a three-fold process. In wrong effort, we have mind and body in conflict, fighting each other. The mind is using willpower to try to force the body to be still and force itself to be still.

And this creates conflict. Because if we're trying to force mind and body to be still, we're trying to suppress our obstacles, our impulses, with willpower. We're trying to crush our obsessions and our impulses with the power of the mind. And this creates strain in the mind, tension in the body. And even if we succeed, we can't get any further. We're blocked.

But in right effort, mind and body are working together. This is the twofold aspect. And when mind and body work together, the heart can settle. The heart can open and settle and unify. This represents the affective aspect of the person. The effort that we're making is conative—it's the willpower aspect. But here, we're talking about the heart aspect. That settles. And it opens up. And then we can become absorbed into the present.

We've talked about how the mind loses its engagement with the present when it becomes overwhelmed by distress signals in the body. And we also said that the mind loses engagement with the present when it's taken over by the concept of a future result. "I've got to get from here, which is bad, to there, which is good. And as soon as possible, thank you very much."

This brings us to the problem of time. And the problem of time is intimately bound up with the problem of effort. Here we will look at another discourse, Majjhima 36, the Mahasaccaka Sutta, where again the Buddha is reflecting on the mistakes that he made in his youth. When he was practicing wrong effort, this is how he described his meditation practice:

"I thought, suppose I clench my teeth and press my tongue against the roof of my mouth, then beat down, control, and crush mind with mind. So with my teeth clenched and my tongue pressed against the roof of my mouth, I beat down, controlled, and crushed mind with mind. While I did so, sweat ran from my armpits."

This is why, you may wonder, in interviews I sometimes ask, "Are you sweating from your armpits when you meditate?" And why I look disillusioned when you say, "No, I haven't noticed any."

You could sum up Gotama's practice at this point as crushing mind with mind. Now, if you engage in this kind of practice, you have to be looking for a result, something that will happen next, in order to justify what you're putting yourself through now. Gotama clearly had an image of himself at some time in the future as finally awakened. And if only he could work hard enough, then he could fulfill that ambition. And if he was not yet awakened—which he wasn't—then it's obvious he's not working hard enough. So he has to work harder, and he has to work harder, and he has to work harder, and he has to work harder.

He goes on to say: "I thought, whatever painful, wracking, piercing feelings due to exertion practitioners have experienced in the past, in the future, or in the present, this is the utmost. There is none beyond this. Yet I have not attained any states surpassing the human by this wracking practice of austerities—any distinction in understanding and seeing worthy of cultivated ones."

This is what he was thinking about when he was reflecting that he had completely stuffed up the whole project. What he was doing was going nowhere.

So what went wrong? Notice that in his description of having done his best—that anyone had done in the past, or anyone will do or could do in the future—Gotama was caught up in the reality of time. Past and future were real to him. And this meant that he was caught up in what he later came to call papañca—conceptual proliferation or complication.

Because time, in the sense of an experience of time, the felt reality of past and future, is real only in the world of concept. It's not real as a direct experience. Past and future are real only as concepts. So he's allowing the world of concept to dominate the agenda. He's allowing concepts of past and future to dominate the agenda, which means he's not actually fully present.

When we step out of the realm of concept, when we step out of the river of stories flowing through our minds, what do we actually experience? Or more intimately, we could ask: right now, what are we experiencing? Are we experiencing the past? Are we experiencing the future?

In reality, in actual experience, all we have, and all we can ever have, is the present.

Now, the present is very wide, and it includes everything that we remember from the past and everything we anticipate for the future. Because after all, when we remember the past, when do we remember it? We remember it now. When we anticipate the future, when do we anticipate it? We anticipate it now. What we've got is now. And we haven't got anything else.

So right effort, if we're looking for it, is found in the commitment to recognizing the felt present. It's all about recognizing what's happening now.

If I'm here meditating because I want to get something else, what is it actually that I'm trying to get? What I'm trying to get is a mental image. It can't be anything else, because it's not actually here. And if I'm constantly reaching beyond, past, what's actually happening now in order to grab hold of an image of what I want to happen sometime in the future, then I'm missing what's happening now. I'm pushing past it as fast as I can to get to where the action takes place. So my relationship to what's happening now is that basically it's not important. It's important only as a step on the ladder that I want to climb, and I want to move past this step as quickly as possible.

This is how we practice when we're caught up in the reality of time and we're motivated to really do the job. And this is why we talk about relaxation and why it's so important.

I want something to happen, something that is not happening now—that's why I came to the retreat. So I work hard to make it happen. But because my view is projected forward to some imagined destination sometime in the future, what I'm actually trying to do is trade in my current experience for what I imagine is going to be more satisfactory. And that very struggle blocks my progress. Because when I struggle, I feel under threat. And when I feel under threat, my body tightens and my mind resists what's happening now.

But let's say I do not want something else to happen, and I also allow myself to be intimate with what's happening now. When I'm fully committed to being aware of what's happening now, then I'm not struggling. Why should I struggle when whatever is hap-

pening now is already available? When I recognize that there's nothing to strive for sometime in the future, then I can relax. Even while the mind is dynamic and active, still it's not striving for something else. It's just fully engaged with the present.

In that state of relaxation, my body opens, my mind is calm. There is pleasure in that opening. And the energy of the mind is devoted to exploring what's going on right now, including that pleasure. I experience ease. The heart opens and it settles. And I'm curious about that ease. I'm interested in the experience. So the mind is very sharp and very alert.

This is what we're looking for if we're looking for right effort. We could sum it up as: How do I maintain maximum commitment in the mind while keeping the body completely relaxed?

One way of experimenting with this, which we've already talked about, is using the lying down posture. Because here we can really get into the experience of the body relaxing while the mind is working. And as we've discussed, and as some of you have already experienced, the movements of the breathing become very clear in this posture. So breathing meditation in the lying down posture can be very satisfactory. As you breathe out, you sink into the floor, the body becomes relaxed. And as this happens, one of the things which will occur is that you will feel very strongly all those parts of your body where you store habitual tension. Then you can just accept this tension, relax into it, and settle into the breathing.

Now, as we said, the disadvantage in lying down meditation is that one can fall asleep.

This could happen simply because we're tired, but let's assume that's not the case. What's happening then is that the relaxation in the body is bleeding into the mind. When we're in the sitting posture, if we're working hard, the effort in the mind can bleed into the body and we become tense. In the lying down posture, the relaxation in the body can bleed into the mind and we fall asleep.

So no situation is perfect. It's always a matter of maintaining a balance and becoming sensitive to the movements—as we go into balance, out of it, lose it, get it again, lose it again, get it again. But the lying posture allows us to explore the question: what does it feel like to be mentally active and awake while physically relaxed? What does that actually feel like? How can I get a felt sense of it so that when I'm sitting, standing, or moving, I know how it feels? The mind knows how to get there, and I can recognise it when it happens.

So experiment with the lying posture. One thing to try is doing a session of lying meditation followed immediately by a session of sitting meditation. Some people find that there's a lot less tension in the body during that sitting period. The body is much more relaxed, and so you can get a sense of what it feels like to be sitting upright with the body relaxed.

As you sit, if you start to feel tension, be aware of it and relax. You might feel tension popping up somewhere else. Be aware of it, relax. It might pop up somewhere else again. Be aware of it, relax. This is another way to get a sense of this balance.

And another thing to check: when you feel the arising of tension, just ask yourself—do I want something to happen? Am I looking for a future result? Is this experience right now not good enough? Just check that. And if that attitude is there, drop it and just be present.

So the project is how to make mental effort while the body remains relaxed. You might try it out particularly in the lying down posture, but then export it to the other postures—any posture. How do I make mental effort while the body is relaxed? This provides a whole field of experimentation, something to get interested in and to explore.

CHAPTER 45

The Insight Chorus Part 1

Patrick Kearney · 50 min

> *In this dharma talk from a 28-day Satipaṭṭhāna retreat, Patrick Kearney begins a detailed examination of the chorus (or refrain) that follows each of the 21 sections in the Satipaṭṭhāna Sutta (MN 10). He explains how this discourse functions as a technical training manual, with the chorus containing the essential heart of insight practice. The talk explores oral tradition in Buddhism, including the remarkable memorization practices still used in Burmese monastic education.*
>
> *Kearney unpacks the chorus phrase by phrase, explaining how tracking body "internally, externally, and both" reflects the dissolving boundary between self and other as practice deepens. He describes the crucial foreground-background shift where the universal characteristic of impermanence (anicca) itself becomes the meditation object rather than merely being noticed in changing phenomena. This marks the true beginning of vipassanā.*
>
> *The talk culminates in an exploration of intransitive or non-dual awareness, where "body is" points beyond subject-object duality. Kearney explains how mature mindfulness (paṭisati) involves both continuity and a recursive quality—awareness aware of awareness. He illustrates this radical simplicity with Ajahn Buddhadāsa's teaching that "rain is wet"—neither good nor bad, just what it is. This ultimate simplicity, free from the endless complications of self-centered agenda, is what the Buddha points to in this profound chorus.*

Tonight and tomorrow night we're going to look at the chorus of the Satipatthana Sutta, the discourse on the applications of mindfulness or the establishing of mindfulness. This is the root text of the practice that we're doing.

In the Buddha's teaching you find references to satipatthana—the cultivation of mindfulness as a practice—scattered throughout the teachings. There's also one discourse devoted to it specifically, which comes in two forms, one slightly longer than the other. And there's a Satipatthana Samyutta as well. A samyutta is a collection, so there's a collection of discourses about satipatthana too. We're looking at the discourse itself.

It's rather unusual. There's no story involved, virtually no narrative framework. It functions as a kind of technical workbook, and it may well have been compiled as a training manual for students. As the Buddha's sangha grew and more and more people were taking up the practice, this discourse was likely composed and memorized—noth-

ing was written down, of course; this is an oral tradition—to be used as a kind of technical training manual. What it does is create a fixed structure that underlies the practice, and it's used for that purpose to this day.

The discourse, the version that we're looking at, which is the shorter version, consists of twenty-one sections—let's call them verses. Each of these twenty-one verses looks at one particular aspect of the practice, classified according to the four categories: body, feeling, heart-mind, and dharma. At the end of each of these sections or verses, there is a chorus that specifically introduces the subject of insight, vipassana. The chorus that follows each verse refers back to the preceding verse, and it's identical in every case except for the bit where it's referring back to the just-completed section. So it lays out the same way of insight for each one of these sections. The sections are basically meant to cover all of human experience, and the insight chorus describes how insight arises in relation to each aspect.

If you're reciting or chanting this discourse—and again, in an oral tradition, that's how information is passed on—the Pali word for "to learn" or "to study" is actually the verb "to listen," because that's how information would come in. A student was a listener. They would listen as the teacher recited, then recite back. The recitation would go forward and back, forward and back. They'd move on to the next section, forward, back, forward, back. And so people would memorize whatever they were studying.

In Burma today, they use a kind of half-oral, half-written approach. They have books and everything's written down. But if you go into the monastery as a boy or a girl, as a novice monk or novice nun, the education system is all memorization—all of it. If you visit a traditional Burmese monastic school, there are no classrooms. What you'll find instead are students sitting cross-legged, swaying backwards and forwards with a book open before them, chanting. Sometimes they're chanting lines individually, sometimes chanting together, but they're memorizing the book.

The Sayadaws, the monks, and the Sayalays, the nuns, are great Pali scholars. How do they learn Pali? Imagine you're a ten, eleven, or twelve-year-old entering the system. Your first book is a medieval Pali grammar written in Pali. You memorize the book. In the examination, you recite the book. If you pass that, you're given the Burmese translation of the Pali grammar, and you memorize that. In the examination, you recite the book. Then you're given another Pali text, then Burmese, then Pali, then Burmese. By the time you get out of the school in your late teens, you know Pali—and you know it really well.

If you go on to higher study, the undergraduate degree is called Dhammacharya, "Teacher of Dhamma." In fact, it's illegal to give a public Dharma talk in Burma unless you have that degree.

They guard their orthodoxy carefully.

But if you want to go on to higher study, you study for Dhammābhivamsa. My main teacher, Sayadaw U Pandita, he was a Dhammābhivamsa. Sayadaw U Janaka, another teacher, he also was Dhammābhivamsa. And if you go to the very top, then you study for the Tipiṭakadhara examination. Tipiṭaka—the three baskets: the suttas, the Vinaya or monastic discipline, and the Abhidhamma. Dhara—one who holds it. But they hold it in their memory. They memorize the entire Tipiṭaka, which is roughly forty large volumes.

When I was there, in December they would hold the examination for Tipiṭakadhara at the Mahasi Centre. You could go along and watch. Very few candidates pass. The failure rate is extremely high.

Now think about these exams. You cannot sit for them once you reach thirty, because it's considered that if you haven't passed by then, you're never going to. This is a young person's endeavor.

They would hold the exam in the main women's meditation hall, which is enormous. They set up rows of these little seats where the candidate sits slightly elevated. In front of him and beside him are examiners. The monk undergoing the examination recites the Pali while two examiners follow along with the texts, checking everything. In the oral portion, you're allowed a maximum of three mistakes, and then you're out—you've failed. There's also a written section, because they're modernizing, you see. In the written part, candidates are asked to write out certain sections, and again, three mistakes maximum. Any failure in either the oral or written section means you fail completely. Come back next year.

So there are very few Tipiṭakadharas. But if you achieve that, your career is set.

It's memorization. In Burma today, if you give a book to a young monk and say, "I want you to study this book," what they assume you mean is memorize it—and they will. They have phenomenal memories.

In the Buddha's time, memories would have been even more extraordinary, because studies have shown something remarkable. In India, research was conducted on a particular caste in Rajasthan where the men's traditional role was to recite the great epics by memory. That's how they made their living, and they would raise their sons to mem-

orize and recite as well. But modernity crept in, and eventually the sons had to attend school for a minimum number of years. What researchers discovered was striking: graduates of those schools, even just primary school, had memory capacities that had dropped precipitously—far worse than their fathers'. It seems that even a small amount of education in literacy begins to torpedo the memory. Which is fascinating.

So in the Buddha's time, memories would have been phenomenal, beyond anything we can comprehend today. Because we don't have memories anymore. We have phones. We have Google. We don't remember anything—except maybe the password to get in there, and even that's a challenge.

But we're talking about people with phenomenal memories, beyond anything we can ever experience.

So in an oral tradition, repetition signals importance. Even in our own culture, the classic popular song has three verses.

Verse one, boy meets girl. Verse two, boy and girl get together. Verse three, boy and girl – tragedy, party. So the verses tell a story; there's some kind of narrative arc. And the chorus is exactly the same, repeating at least three times. The chorus provides the essence of the song. And if twenty years later you're meditating and feeling a bit bored, and your mind starts throwing up this song you remember from a few decades ago – how did it go again? What do you remember first? The chorus.

So the chorus in this discourse, you can see that's the centre. And everything builds off that. The chorus is very important. And yes, that's how they memorised – they chanted. They either chanted alone, but in particular they chanted in choir. This means that the transmission of the text was much more accurate than writing it down. Because you've got a group of people chanting a particular section of teachings, and if anybody chants anything different, if a single word is different, everybody knows. Everybody knows we've got a problem, and you've got to work it out.

But when they started writing the discourses down – and as far as we know, this happened first in Sri Lanka during a period of famine and civil war – circumstances became dire. If you have famine, for whatever reason, and the monks and nuns live off the gifts of the laypeople, but the laypeople don't have anything to give, then the monks and nuns starve. Basically, they've got a choice: they could disrobe and fend for themselves, or they could die.

During this particular famine, compounded by civil war, when society was finally reconstituting itself, one of the first things the authorities did was ask: how many monks have we got left who actually remember the teachings? There were so few that they got really worried and decided they had to write it down, just in case. And this was seen as evidence of the decay of the Dharma.

So you've got people copying every single word. In modern volumes, you've got forty large volumes, but they were scratching it on palm leaves because they didn't have paper. It's a tedious, humdrum, never-ending job. And it has to be done again and again because the palm leaves rot in the monsoon. So they've got to do it again and do it again. And who gets to do that job? The people at the bottom of the hierarchy – the novices. "You take care of it." So they make a slight mistake in writing it out, where one letter looks rather like another. Who picks it up? No one. And then the mistakes start to creep in over the centuries. So the oral tradition is very powerful.

Anyway, that's enough preliminary. Let's get into it.

We're looking at the first instance of a chorus, in the section on tracking the body. The Buddha says – and again he's describing the practitioner. Often when he's talking about the practice, he doesn't define it; he describes someone doing it. This is the way that he conveys it.

"In this way, she lives tracking body as body internally, or she lives tracking body as body externally, or she lives tracking body as body both internally and externally."

Now, in the first verse, it's all about the practitioner lives tracking body as body. So tracking physical experience. Body as body means it's just this sensation. That's it. It isn't anything else. Just this. Just this. So this is the boot camp of the training.

But here, she tracks body as body internally, externally, both internally and externally. So what's this about? Basically, as the practice deepens, our sense of the solidity of the body fades away. As does the sense of an absolute boundary between self and other, between in here and out there.

Where is the border of the self? For practical purposes, for most of it, the border of the self is here. The self occupies this body. And just outside the body is the world—internal, external. But as the practice deepens and perception starts to change, this sense of a boundary begins to get aberrant. It's more dynamic and more shifting than before, and may even start to disappear.

Now, this boundary gives us a sense of subject-object duality. Our normal relationship to the world is based on the fundamental perception: I am in here, and you lot are out there. And what is happening in here, to me and to mine, is far more important than what is happening out there to you and yours. This is bleeding obvious, but if you behave in a way which indicates you don't understand this, I will correct your mistake.

So this is, of course, the construction of self. Now this fundamental sense of duality or separation is not inherent to awareness. It's a structure imposed upon awareness. It's a product of habitual grasping. And as the practice develops, what we begin to recognize is that this way of structuring our experience—me here, you out there—is not fundamental. At first I assumed that it was, but it turns out that it isn't.

So our sense of an absolute boundary between inner and outer starts to fade, and with it, our sense of an absolute boundary to I and mine, him, you and yours, there. We begin to realize that the movements of mind and body that we are experiencing in the practice are not mine. They're not unique. They don't define me. They're universal and they're fundamentally not personal.

And I begin to see that what is true here is true there. It's true everywhere. I recognize that the experiences arising here in this sentient body are not personal and not mine. They're just nature. And nature belongs to everyone and to no one. So this sense of a boundary between self and other starts to weaken.

And then the Buddha goes on to say, she lives tracking the nature of arising as body, or she lives tracking the nature of ceasing as body, or she lives tracking both the nature of arising and the nature of ceasing as body.

So again, the language changes. Again, it's all about tracking, the continuity of awareness. But here, the tracking is the nature of arising and ceasing as body. And this represents a shift of perception. We begin with a meditation object—let's say the breathing, which is part of the body. And as we track it over a period of time, we notice that it changes. Has anybody noticed that the meditation object changes? Yes.

So what the Buddha is talking about here is a shift in perception from tracking the meditation object and noticing that it changes, to tracking the fact of change itself and noticing that it's happening in the meditation object. And this means what's being introduced is insight. Because insight is always characterized by generalization, by universality. And strictly speaking, according to the tradition, this is where insight meditation actually begins.

It begins when the object of awareness, the meditation object, is the universal characteristic of impermanence itself. Until then, we're doing a kind of preliminary serenity practice to get us to this point.

And alongside impermanence, the anicca lakkhana, we find dukkha lakkhana and anatta lakkhana—change, pain, not-self. They always come together as a package. But the first one to be introduced, the first one the Buddha talks about, is change. Basically because it's the most obvious. It's the easiest to recognize.

So what we're talking about here is what we could call a foreground-background shift. At first, let's say I'm actively aware of a meditation object. That meditation object—let's call it a breathing object—is at the foreground of my awareness. But just because I'm tracking the breathing doesn't mean that everything else is disappearing. Other things are happening: sounds, temperature, thoughts. But they're in the background. I'm aiming at one thing or a group of things, and that is in the foreground while other stuff is going on in the background.

Sometimes they swap around. Let's say I notice in the background there's a bit of thinking, and the next thing I know, breathing is in the background—or gone—and the thinking is in the foreground. But I've still got foreground and background. And then I realize I've got to establish a new foreground, put the thinking aside, bring the breathing back. Foreground, background.

So I'm tracking the meditation object, and I notice that it changes. In the foreground there's the meditation object and all the different changes that are happening to it. And one of the things in the background is the observation: oh yes, it really does change. I had a good sitting with the breathing in the last period, and this sitting was complete rubbish. So it changes. It's different. I can't really rely on it. That's a background observation. Then in the foreground, come back to the breathing, come back to the breathing, come back to the breathing.

Then at some point, there's a foreground-background shift, and the meditation object as an isolated entity or process slips to the background, while the foreground is occupied by the universal fact of change itself. If we're talking about breathing, it may be that it's no longer my breathing—it's air element. And air element is by nature impermanent. It doesn't belong to me. It's not restricted to me. So we begin with perceiving the object of awareness as both internal and external. This sense of things opening up starts to happen. And then there's a shift, and the universal fact of change itself occupies the foreground, while the object which changes fades to the background. It's still there, but it's no longer where the action is. The action is in the foreground—the fact of change itself.

Now this shift is very subtle. So much so that sometimes it can happen without the practitioner even noticing it. Sometimes the practitioner is reflecting on their practice and they think, "You know, it's different these days. I can't quite put my finger on it, but it feels a bit different." And then they realize what's happening: "I'm no longer actually preoccupied by the meditation object which is changing. What I'm looking at is the fact of change, and it includes the meditation object."

This shift is very subtle and it's not something that we can do. It's not part of our agenda. We cannot do it. It either happens or it doesn't happen. But we can prepare for it by ripening the circumstances that will give rise to it. And this is done by cultivating the perception of impermanence, or the perception of change. We'll talk more about this later in the retreat.

So there's a shift which just happens, and then the meditation object becomes one or more of the three universal characteristics. At first there's a meditation object which begins to display the three characteristics. And then at some point there's a very subtle shift. And actually the meditation object becomes the three characteristics—that is happening in that meditation object.

And now we have entered into the world of insight.

The Buddha says further, "Her mindfulness is established as body is." Sometimes you see this translated as "there is body." The Pali is *atthi kāyo*. "Further, her mindfulness is established as body is, just for understanding, just for continuity of mindfulness."

This is the third sentence, and the rest of the talk will unpack it, because there's a lot here. Here we enter into what some traditions might call non-duality, or at least non-duality becomes clear.

Let's begin with "body is." Again, we have some aspect of body as the meditation object. At the beginning of the retreat, when we were introducing all this, we talked about awareness. We said awareness always has an object—if I'm aware, I'm aware of something.

Now let's compare this to grammar. In English grammar, we have verbs that are transitive and verbs that are intransitive. A transitive verb is one that has a direct object. For example, the verb "to see": "I see you." In that sentence, we have a subject (I), a verb (see), and an object (you)—the one whom I see.

An intransitive verb is a verb that does not have a direct object. For example, "It rained." We have a subject (it), we have a verb (rained), but we don't have an object. It's just rain.

The sentence "I had a bad dream"—the verb is transitive. We have a subject (I), a verb (had), and an object (bad dream). The verb links subject to object: I had a bad dream.

Now contrast this with the sentence "I was sleeping." We've got a subject (I), we've got a verb (was sleeping), but we don't have an object. I wasn't sleeping something. I was just sleeping.

Notice how intransitive verbs without an object are about process. They're about doing. They're not about the things that are processed or done. They're just about the process, a doing, an activity.

When we begin the practice, we emphasize the transitive nature of awareness. If I'm seeing, I'm seeing something. If I'm hearing, I'm hearing something. If I'm thinking, I'm thinking something. This is transitive awareness—the fact that we have a subject (I), an object (something), and a verb.

This distinction goes deeper than just grammar. Transitive awareness is awareness that is structured by subject-object dualism. Duality. So "I see you" doesn't just convey a grammatical structure, but an existential structure. There is I here, there is you whom I see—someone who is separate from me—and there's seeing, awareness that links the two.

And in this distinction, what is the most important?

What is primary? It's I. Everything revolves around I.

But when the Buddha says "body is," he seems to be speaking about intransitive awareness. Body is. What exactly? Well, he doesn't say. There's nothing there. There's nothing filling in the gap. He just says, "body is." So there's no object. But if there's no object, there's not really any subject in it either. So there's no dualism. There's no one experiencing body. There's no one whose body this is. There's just body. Body is.

And this represents a relationship to experience which is characterized by radical simplicity, by intimacy. This relationship lies beneath all the normal layers of concept and meaning that we pile on top of our experience in order to make sense of it.

So her mindfulness is established as "body is." And then he adds: "just for understanding, just for continuity of mindfulness."

This "just for understanding" expands the significance of the intransitive or non-dual awareness. It indicates the natural arising of wisdom. Because when the conditions are right, understanding arises. And remembering that I cannot do insight—looking for it or trying to make it happen is completely useless. Because this is just the agenda of I, locked into the subject-object duality.

In the Pali, this "just for understanding" is *ñāṇa-mattaya*, where *ñāṇa* conveys knowing, understanding, and *mattaya* conveys the sense that there's nothing beyond this—it's just this. It also conveys that the understanding itself is not for anything. It's not instrumental in its nature. The practice and the understanding that it generates is not instrumental. It has no goal within itself. We're not trying to get something out of it. It simply is what it is, full and complete within itself.

"Just for continuity of mindfulness"—this is *paṭisati-mattaya*. And this takes things a step further by introducing intransitive or non-dual mindfulness, conveyed by adding the prefix *paṭi* to *sati*. So *sati* is mindfulness, and again and again the Buddha talks about mindfulness using the word *sati*. But sometimes, like here, he uses the term *paṭisati*. So what is this prefix *paṭi* about?

In Pali and Sanskrit, prefixes don't have an exact one-to-one meaning. Prefixes have a cluster of possibilities, and the person reading or reciting the text can reach in and pick out this possibility or that possibility. So there are inherently different ways of reading this. That's very typical of the Indian tradition—they play with language and draw out different possibilities. Often this is what you see in commentary. If you ever look at the Pali commentaries, the main commentator is Buddhaghosa, and sometimes he'll ask, "What does this word mean?" and then give a list of four or five meanings.

Then he would give a Dharma talk based on each one of them. It's not that there's one meaning. He's being playful. He's saying, well, you can play with it this way, you can play with it that way, you can play with it the other way. So there is this playfulness with language that's built into this method.

Pati can be taken to indicate again—in other words, continuity over time. And as we've been saying, continuity is built into mindfulness. What's the difference between awareness and mindfulness? Mindfulness is awareness continuously over time. So continuity is built into the concept of mindfulness. There are no gaps of forgetting. *Pati-sati* indicates really strong continuity—the continuity is getting very powerful.

But *pati* also indicates "back" in a recursive sense. In other words, it refers to what we could call awareness of awareness. The awareness comes back. The mindfulness comes back. This is what we've been calling intransitive awareness. We could say it's awareness, awareing, awareness.

Now, this indicates mature mindfulness. The continuity emphasizes maturity. But the intransitive nature of it—the awareness awareing awareness itself—also indicates maturity of the mindfulness. And this mature mindfulness is associated with clarity and depth. This is going very deep.

So *pati-sati* can be read as indicating both the continuity of mindfulness, the unbroken nature of mindfulness, along with its depth and its clarity. Look at Anālayo's translation. He translates it as "continuity." He emphasizes the first meaning.

So, *yāvati ca sati matāya*. And again, *matāya* indicates that this is not for anything. It's just itself. It's just for itself. Both of these indicate a radical simplification and maturity of the practice.

Notice how the practice becomes simpler when it matures. On Wednesday night, we were talking about Mahasi Sayadaw, and he was describing how the stream-enterer—let's say the graduate of the whole system—will never forget how to meditate. He points out that the mature level of this practice has got nothing to do with the method. It's got nothing to do with the technique. It's simply tracking what's happening over a period of time. Just: this is what's happening, this is what's happening, this is what's happening. This is what the Buddha was talking about here.

And it is the simplicity of this practice that makes it so difficult. We want to make things more complicated. We make things more complicated by judging them, by manipulating them, by massaging them. All of this is trying to make the experience fit me and my concerns.

Have you ever come into the meditation hall and sat down? You start, and the experience could be regarded as dukkha-ish. You respond by thinking, "Oh, well, conditions aren't so good this morning. I didn't get much sleep last night. I'm a bit tired. Maybe I should take a break. Then I'll come back later on and it'll be better." So we're overlaying the experience with judgment, manipulation, and so on. We're making it complicated.

But it's actually very simple. I'm sitting here, and I'm tired. That's it. That's what's happening.

So what the Buddha is talking about here is a practice where there is no agenda, and therefore there is no practitioner. Because the practitioner always has an agenda. The self always has an agenda. But once the agenda is dropped, the practitioner is dropped. What we have is complete intimacy with no sense of any purpose to the practice beyond this situation, even now.

So mindfulness and understanding are strong, and with them come equanimity and balance, and the three characteristics simply appear by themselves. They're kind of bleeding obvious. And this is insight.

I think that's probably enough, really. I've got more I could say, but I think it just makes things more complicated. Let me try to make it less complicated with a story.

Many years ago, I spent much of the 1980s in Asia, and a fair amount of that time as a monk. I was ordained in Burma, doing relentless Mahasi meditation. Mercifully, the visa ran out and I went to Thailand. Phew!

There I established myself as a monk in the Thai system. I stayed in various places during my time in Thailand, but I would always come back to one monastery in the deep south—Ajahn Buddhadasa's monastery. At the time he was alive and flourishing. The abbot, Ajahn Po, started running retreats for farangs—mostly Westerners.

If you're familiar with southern Thailand, the isthmus gets very, very narrow. And in the Gulf of Thailand, there are two big islands, Koh Samui and Koh Phangan. Have you heard of those? They've become these huge resort islands now. But in the early 1980s, it was just the hippies who had discovered them, and the infrastructure was very, very primitive.

Ajahn Po, who ran Wat Suan Mokkh, was actually a native of Koh Samui. *Koh* means island, so Samui Island. Every now and again he would go home to visit family. And as he would visit, he noticed an increasing number of young, obviously prosperous people from the West who had come to Koh Samui to enjoy themselves—which they could do very easily because everything was so cheap. The more he saw these people, the more sorry he felt for them. Because, he said, they all seem to be miserable. They all seem to be suffering. So he thought, we've got to do something for them.

They started running these retreats, and gradually it built up. But this particular retreat I'm about to describe was very early in those days, and the retreat itself was held inside Wat Suan Mokkh, which was on a hill. It still is a hill.

Ajahn Buddhadasa moved to the base of that hill, I think about 1932 or 1933, early 1930s, and at that time it was all jungle. He tucked himself away and practiced and studied and tried to avoid people, except his reputation spread and monks came to join him. Gradually a monastery developed. People came to support him. And then as development came and forests were being chopped down, the lay people protected that area by building a wall around it.

So when I was there in the early 1980s, everywhere outside the wall the forest was gone—just paddy fields—except for what was inside this wall and on the hill. That was all covered in the original jungle, and that was the monastery.

They started running these retreats, but the facilities weren't really developed for them. The meditation hall was at the back of the property—just a hall and a playing field. Obviously at some point it had been used for the local kids to play whatever they played. That field was just outside the jungle, and inside the jungle, in different buildings, they had worked out primitive accommodations.

And they built kind of bush toilets and bucket bathing facilities. There was a dining area—a big tent put up to keep the rain off with open cooking facilities. That's where the food was.

For the Dhamma talks, you'd go into the heart of the monastery, which was all properly constructed, and enter the Bort. The Bort is the main ceremonial building, very elaborate, built of concrete. And Ajahn Buddhadasa would give these Dhamma talks seated on a traditional Dhamma throne. It would go up from here to the ceiling, the height of it. He must have climbed up a ladder to get there. He was towering over everybody else—because if you're higher than others, it means you're on top of the hierarchy. The Thais are very aware of altitudes in terms of how to show respect. So it was quite an affair. Up the steps, get in there, and he gave his talks.

One of the reasons they were running this program was because there happened to be a resident at the monastery, an American monk from Chicago originally. He'd gone out to Thailand on the Peace Corps and had learned Thai, become fluent in it. When his time was up, he ordained. And he was a superb interpreter, a superb translator. Buddhadasa would rattle off these Dhamma talks and the interpreter would go for it. He was just really good.

Anyway, one day Buddhadasa is explaining the ultimate truths of Buddhism. These were in terms of—I think there were nine *tās*. *Tā*, T-long-A, roughly in English is "-ness." It turns something into an abstract. So *anicca*, impermanent. *Aniccatā*, impermanence. *Dukkha*, painful. *Dukkhatā*, the fact of suffering. *Anattatā*. And so on.

So he's going up this kind of ladder of increasing philosophical sophistication and deep realisation. And finally he comes to the top. And at the top is *tathatā*. And *tathā* means "just"—just so, just this. And he's explaining that this is the ultimate truth of Buddhism, and we're kind of sitting in it.

He tried to explain it. He said, "Look, it's wet season." And in fact it was monsoon season, which meant every day it just poured down. And it's a jungle. The jungle is seething with life of all forms. Everything is incredibly humid. Nothing dries. Anything that can rot does rot, including human flesh.

And if you do this retreat, it means you've got to slosh around from one place to another—from the hall across the park to your accommodation, from there to bathe, back to the accommodation, then to the dining hall, and from there trudge to the centre of the monastery for your Dhamma talk. So everybody was completely sodden.

The Thais had pity on us because we'd sit on this concrete floor and people would begin to whinge. They were not comfortable. Can't you get comfortable on concrete? So feeling pity on us, feeling compassion, they arranged that each meditator would have their very own hessian bag—an empty hessian bag you could sit on during the Dhamma talks—which of course became completely sodden. So we're sitting in this hall on sodden hessian bags, dripping with water.

And he looks down on us and he says, "It's raining."

And you think, the rain is bad because you're sloshing around in the mud all day.

"Well, let me tell you something. On the other side of this hill, there are farmers who right now are dancing for joy in their fields, because this rain means that they can feed their families for another year. So you think the rain is bad. They think the rain is good. You're both wrong. The rain is wet."

And this is the highest truth of Buddhism.

That was the end of the talk. A very fitting and appropriate end. This is the ultimate simplicity that the Buddha is getting at in this chorus. Rain is wet. I'm sitting here and it hurts. I'm sitting here and it's really nice. That's it. That's all there is.

But we're not satisfied with that. We're driven. "Oh, I want more of this. Oh, I don't want that. But if only I can negotiate it so that I can get what I want, then I'll be okay. Then I'll be able to meditate." Endlessly. And this is just endlessly adding complication upon complication upon complication.

But the practice is taking us towards radical simplicity. And if we hit it, we actually find out what the Buddha is talking about.

Okay, that's enough for tonight. Any questions?

Let me anticipate one question. No, it won't work if next time it rains you just go outside. That shortcut doesn't work. Believe me, I've tried.

Any questions?

"I have a question. Sometimes in the news, you hear about people who have just responded in a moment to a situation. You know, like you've probably all been in that situation where somebody drops something and you just pick it up—there's no thought, it's more of an impulse. Sometimes you can see these poor people that the news reporters have got hold of and made a story out of, and they say, 'Oh, you caught some child, or something that was falling.' And I think these poor people, they just don't look at the camera—I don't know—because you get the sense that there's no one doing it."

This is what the Chinese call no action. And in Zen it's quite significant. You just live. And there's no one living life. It's just life.

Thank you very much.

CHAPTER 46

Open Awareness (Workshop)

Patrick Kearney · 38 min

> *In this workshop from a 28-day Satipaṭṭhāna retreat, Patrick Kearney examines the relationship between active and receptive awareness within the Mahāsī Sayādaw meditation tradition. He distinguishes between 'noting' (active awareness where we send attention to objects) and 'noticing' (receptive awareness where objects come to us), explaining how both lie on a spectrum essential to practice development.*
>
> *Kearney shares a memorable teaching story from Sayādaw U Paṇḍita's first Australian retreat, where teacher John Hale would respond to distressed meditators with one simple question: 'And did you note that?' This illustrates the profound simplicity underlying the practice. He then introduces the metaphor of mind as a window—we typically focus on what lies beyond the window while remaining blind to the window itself. Through receptive awareness, we begin to notice the medium through which we perceive, becoming sensitive to the state of mind doing the observing.*
>
> *The talk includes a guided meditation exploring open awareness, using the image of gradually loosening one's grip on the breath while maintaining a stable 'posture of awareness.' Kearney discusses how this receptive mode cultivates sensitivity, connects to sammā-vāyāma (right effort), and proves particularly valuable for everyday mindfulness. He notes that while some practitioners find this approach liberating, others may struggle without something concrete to grasp—highlighting the importance of finding what serves each individual's path toward insight.*

When we started the retreat about a week ago, we began with awareness, and then we went from awareness to mindfulness, and then we introduced the meditation method. The meditation method revolves around what Mahasi Sayadaw calls noting and noticing—what we could call active awareness and receptive awareness.

Throughout the week we've been working largely with active awareness, where we're learning how to send awareness to particular meditation objects, particular aspects of human experience. One thing that distinguishes this approach is that every aspect of human experience is a meditation object. Nothing is excluded.

I'm reminded of the first time Sayadaw U Pandita taught a retreat in Australia. He taught a six-week retreat at a Catholic retreat center in the southern highlands, south of Sydney. A lot of people turned up because he had developed this reputation and people

were curious. You could say there were waves of shock running through the meditators as they were actually exposed to U Pandita and his approach to the meditation, which was absolutely relentless. As a result, there was a certain amount of discombobulation among the meditators.

The manager of the retreat was John Hale, who I'd met originally in India but got to know in Burma at Mahasi Centre, and who was even then the most advanced practitioner I'd ever known. Once a day, there was a time we'd go and see John in order to request anything we really needed—if we ran out of toothpaste or shampoo or chocolate or some absolute necessity. This turned into impromptu dharma counselling sessions, where the most agitated meditators would come and talk to him.

I found out about this because there was a breezeway in the building, and against one wall there was a sofa where he would talk to people. He'd be on one end and the meditator would be on the other end. To get to my favourite walking meditation place, I used to go down and come back up through the breezeway, and so each day I'd be walking down, and each day John would be there, talking to a distressed meditator. Sometimes when I came back, there was another distressed meditator. He was still there, still going. Sometimes not.

But the conversations always took exactly the same form: the meditator talking, and John saying absolutely nothing, but listening with total attention and total compassion. Finally, the meditator would stop talking, and John would say, "And did you note that?"

As far as I could tell, that was the only thing he ever said. And of course he meant it. What he was illustrating was the utter simplicity of the practice. And what the meditators were illustrating was the determination to make it more complicated.

This is what the practice is all about: the simplicity of awareness.

The word that John was using was, "Did you note it?" Were you deliberately turning towards it? Did you actively engage it? When we look at Mahasi's approach, sometimes in the lineage they talk about noting, and sometimes they talk about noticing. We've talked about this before. Noting is active awareness. It's sending awareness to its object, and it's characterized by its active nature. Then you have noticing, or receptive awareness, where you're not sending awareness anywhere, but rather the meditation object is coming to you. In active awareness, I go out to the meditation object. In receptive awareness, the meditation object comes to me.

These lie on a spectrum. In the early stages of the practice, what tends to be emphasized is the active. U Pandita, in particular, really strongly emphasized the active. Generally, that's probably the most common approach, because active awareness first of all

gives the practitioner something to do. If you say, "Well, just sit there and be aware," no problem. But what? What do you mean, be aware? What does that even mean? How do I do it? What am I supposed to be aware of? Why am I doing this? And the questions start piling up.

But if you have a specific project—sit here and just see if you can follow the in-breath and the out-breath—then the practitioner has something to do, something to engage with, something to get the process started.

But of course, the noticing of receptive awareness is always there. And over time, it may actually become much more important. So when we're practicing the noting and the active awareness, there's always something in the background. I can feel my body. I can hear sounds. I notice there's thinking going on. There's sensations in the body. So I'm actively aware of the meditation object while receptively noticing everything else around it. Foreground, background, as we talked about before.

Now, this noticing—the receptive aspect of the practice—has an enormous amount to teach us. We practice mindfulness because we want to know what's going on. Mindfulness for the Buddha is always associated with wisdom, with understanding, which is essentially finding out what's really going on. The noting, the active awareness, cultivates energy, strengthens the mindfulness, and develops concentration. It's like a specialized exercise regime in a gym. You go through, repeat certain exercises, and get better at them over time.

But of course, at some point, we leave the gymnasium and re-enter the ordinary world. And the question then is: I've developed this strength, now what do I do with it? What we do with it in our ordinary lives is very largely through receptive awareness rather than active awareness. And how do we do that when receptive awareness is characterized by an absence of doing? Active awareness, we do it. But how do we cultivate receptive awareness when its characteristic is that it's not doing?

I think this works through sensitivity. The active awareness, the noting, makes the mind stronger. And remember that for the Buddha, mind is one of the senses—it's the sixth sense. And a sense is a sensitivity. It's one aspect of the sentient body which is sensitive to particular forms of data. The five physical sensitivities are sensitivities toward data that come from the physical world. The eyes are sensitive to light and color. The ears are sensitive to sound. The tongue is sensitive to tastes, and so on. Mind is also a sensitivity. And as the mind becomes stronger and clearer through active awareness, it also becomes more sensitive. Because it's becoming much more sensitive, it's opening

up to all sorts of forms of data that normally it doesn't catch. This is one of the reasons why we emphasize that we must be particularly careful in our interrelationships with each other—people are very sensitive when they become mindful.

Now, this sensitivity depends in part on our relationship with sammā vāyāma, right effort, right energy. Sometimes we might be making too much effort in the meditation practice. We might be straining in our effort to do something, to accomplish something, and we might lose the sensitivity to what else is happening. We might become so absorbed in our project that we become blind to anything else. That's one of the reasons why we've talked about finding right effort, the importance of right effort. And the sensitivity we're talking about here is, of course, very closely linked to vedanā, the world of affect.

I might just give an illustration. This was the first time this whole area of the practice was introduced to me explicitly, and it was by John. He gave a simile which at the time I had absolutely no idea what he was talking about. But I've got to offer it up and see if you can make any sense of it.

He said, during this practice, it's rather like imagining yourself standing in a room with a big window that looks out over a garden. You're the meditator, standing there looking at the garden, and the meditation teacher is right beside you. Your companion, the meditation teacher, asks you, "What do you see?" And you answer, "The garden." And your companion says, "Look more closely."

What do you see?

And you say, "Well, I see a rose garden."

Look more closely. What do you see?

"I see a bed of roses."

Look more closely. What do you see?

"I see a rose bush."

Look more closely. What do you see?

"I see a rose."

Look more closely. What do you see?

"I see a rose petal."

Look more closely. What do you see?

"I see a dewdrop on the rose petal."

Look more closely. What do you see?

"I see the light shimmering off the dewdrop."

Look more closely. What do you see?

"I see the window."

And I thought, what on earth is he talking about?

What we're talking about here—what receptive awareness opens up—is the window. The mind is like a window. It's the medium through which we look out at the world. And the window is so obvious that we don't see it. We think what's on the other side of the window is what's important. It doesn't occur to us that what's important is the window.

But the window is absolutely essential to the whole business. If there was no window, we couldn't see anything. If the window is there but dirty, the view changes. If the window is wet, the view changes. If the window is coloured, the view changes. If the window is completely clear, the view changes—and the window just disappears.

In receptive awareness, we're learning to notice the window. We start to incorporate the window into what we see. In other words, we begin to pay attention to the state of our mind as we are being mindful. And in large part, we enter into this through the noticing of receptive awareness, rather than the noting of active awareness.

We could call this open awareness. The Buddha doesn't have a Pali term for it, as far as I know, so you encounter different words for this style of practice and its variations. Back in the last millennium—long, long ago—this was what used to be called choiceless awareness. Choiceless awareness was very fashionable at one time, and I think the term actually came from Krishnamurti. But these days, if you talk about choiceless awareness, you're just showing your age, so I advise avoiding that term.

Then open awareness became fashionable, and that's been in vogue for some time. But these days, if you want to be hip, if you want to be on the cutting edge, talk about natural awareness. That seems to be the flavour of the moment. I'm just taking the middle way and calling it open awareness.

Open awareness, or receptive awareness, or natural awareness—whatever we choose to call it—is not a specific technique. There are different ways in which people go about it; it's not that there's one way of doing it. But this morning I'm just presenting one possibility, one game to play. We'll play with it and see what happens.

Now, during this guided practice, I'm going to use breathing as the meditation object. But if you want to use something else, just use something else. It's not dependent upon the breathing. So if I say breathing, you can simply go into whatever your chosen meditation object is.

I'm going to use an image. As we said, active awareness is when awareness goes out to take hold of the object. So the central image is this idea of reaching out and holding an object of awareness—just like our hand might reach out and hold something. As the game progresses, we're going to become interested in how tightly we're holding. In other words, we're going to become interested in the state of the mind which is doing the noting.

So, let's begin.

Settle awareness in your body. Construct your meditation posture. Be aware of the sensations at the base of your body, and from there lift up through your spine. Relax your shoulders and let your head come into balance.

Let yourself become aware of what is happening throughout your body. At the bottom is the hardness and stability of your contact on the ground. Rising up from there is the lift and firmness of your spine. Around that frame, there is a field of sensations coming and going.

Now track the movements of your breathing. Follow your breathing. Be interested in what is happening to your breathing. It is as if you are holding the movements of your breathing in your hand—keeping your hand steady and watching what you are holding.

Now relax your grip on your breathing so your hold is more gentle, less intense. Allow yourself to become sensitive to the broader field of awareness around your breathing. Become interested in the space within which being aware of breathing occurs.

Don't do anything with your breathing. Just hold your mind steady. Breathing comes and goes. Be interested in this without clinging to it.

Your mind changes all the time. Be interested in this without clinging to it. Awareness moves from one object to another. Be interested in these movements without trying to stop them.

Don't force anything. If breathing slips out of view, let it go. Just notice that it slipped away and what replaced it. Things come and go. Let them. Just stay aware that things are coming and going.

Open your awareness to the space within which things come and go.

We could see this practice as first establishing a physical posture and from there establishing a posture of awareness. Then we hold that posture of awareness but let the objects of awareness move and change, come and go. If you get lost in thought, come back to breathing. When you feel settled and stabilized, relax your hold on your breathing and open up to the mind itself—letting objects of awareness come and go as you maintain your posture of awareness.

So how did it go? You took a nap? It didn't hold your interest? Too relaxed? Peaceful?

Were you awake?

Very aware and very peaceful.

That sounds like a good combination. What do you think made it very aware and very peaceful?

The lack of pressure. It took me a while to see what the problem was. It wasn't around the vision—I didn't understand what was going on.

So you managed to find that gentle receptivity, but as you say, it took some time and it snuck up on you. This rather points out the paradox: you can't actually *do* it. If you try to do it, you'll probably smother it. But if you let it sneak up on you...

Yes, Carolyn.

I think there's a similarity with terms that are comfortable in Christian culture. But I noticed also there's this hinge of anxiety. While I was enjoying it, there was this thing happening—these undercurrents of anxiety. Like, I don't know if I'm going to be able to maintain this for as long as I need to. Right now I'm aware, but I don't know if I'm going to be able to stay aware.

That might be a factor, because again, if you've got something to do, then as long as you keep doing it, things should be okay. But if there's not something you're specifically doing, then you've got no control over it. The habitual holding on to the breath becomes

difficult—or rather, the habit of holding on to the breath becomes difficult to let go of. The mind tends to go, "Get me out of here." The mind wants to hold on. The power of habit.

It's interesting, isn't it? When we're practicing, if we do it a lot, we're creating new habits—the way that I meditate. And sometimes, over a period of time, these habits will get in the way because the practice matures. But if I'm locked into a certain way of practicing which I just default into, then I can get stuck there. It's difficult to move on.

So it's very interesting when you notice that what you're doing is simply allowing habit to take over. And it's very useful to see that, to get a sense of it. It's a better way to possibly abandon that habit.

Because the habit gives security.

Yes. Yes.

So this is one style of what you could call open awareness. People have different relationships to it. Some people find that it just doesn't work for them—there's nothing for the mind to grab onto and they just drift off or get bored. Other people find it a huge relief. They think, you know, there's no business—it's like a straitjacket has been removed and now they can finally be liberated. You get all sorts of different responses.

As I said with all these exercises, if you find it useful, do it. If it's not useful, forget about it.

But more generally, the receptive aspect of awareness—well, first of all, some people make it their entire practice. That's what they do; that's their whole approach. Some people use it particularly in everyday mindfulness. Even if you prefer a more active style of meditation when you're doing a formal practice, when you're out and about, the open awareness becomes a kind of home base. And it's quite important for staying present throughout whatever activity we're doing—staying present to it.

But this approach can also give you a sense of the whole package: the object of awareness and the awareness itself. Getting a sense of that whole package is very useful, particularly if you're meditating for the purpose of insight.

Receptive awareness can give you an entry into starting to notice that whole package of awareness itself.

And the other thing is, if you've had a good time with this practice, keep in mind that you've been meditating for a week now. The mind is sharper, clearer, stronger, more sensitive than it is under normal circumstances. What you've experienced today may not necessarily be what you would experience all the time—it may be completely different. But if you find this is something useful to add to your repertoire, then use it.

Thank you very much.

CHAPTER 47

The Insight Chorus Part 2

Patrick Kearney · 37 min

In this continuation of his examination of the Satipaṭṭhāna Sutta's insight chorus, Patrick Kearney focuses on the final sentence: 'She lives independently, not clinging to anything in the world.' He explains how this independence (anissita) represents the maturity of practice—not a meditation technique, but a way of life where nothing further needs to be gained and the practitioner experiences no sense of lack.

Kearney draws on multiple sources to illuminate this teaching, including the Alagaddūpama Sutta (MN 22) where devas cannot locate an awakened one because they find nothing that awareness depends upon, and the Attirāga Sutta (SN 12.64) with its famous simile of light that lands nowhere. He connects these Pāli teachings to the Diamond Sūtra's 'unsupported heart' and the Chan phrase that awakened Huineng: 'Dwell nowhere and bring forth that mind.'

Through vivid Chan stories—including Dàowú's refusal to say whether someone is alive or dead, and Luóhàn's teaching that 'not knowing is most intimate'—Kearney illustrates how liberated awareness cannot be captured by concepts. The practical implication is profound: when we recognize that our concepts and labels never match actual experience, we can relax into uncertainty. This genuine not-knowing keeps us alert and curious, naturally giving rise to sati-sampajañña (mindfulness and clear comprehension). The talk concludes with a discussion of how upādāna (clinging/appropriation) creates the sense of self, and how mental phenomena can arise without identification—simply coming and going according to conditions.

Last night we started talking about the insight chorus of the Satipaṭṭhāna Sutta. We said how the discourse itself acts as a kind of technical workbook for this practice. It has twenty-one different sections, and each section ends in a chorus where the chorus talks about insight—the arising of insight. In English translation, this chorus is quite brief: four sentences. Last night we covered the first three, which leaves one for tonight.

So we'll start from the beginning. "In this way she lives, tracking body as body internally, or tracking body as body externally, or tracking body as body, both internally and externally." Tracking body as body means this physical experience is just this physical experience. It's not what I'm projecting into it. It's not what I want about it. It isn't what I want it to do. It isn't what I don't want it to do. It's just a physical experience.

Here the sutta talks about internally and externally—the fading away of the absolute distinction between self and other, here and there, that begins to drop away as the meditation practice deepens. Things start to loosen up.

"She lives tracking the nature of arising as body, or tracking the nature of ceasing as body, or tracking both the nature of arising and the nature of ceasing as body." Here you get a shift into insight, unambiguously, where what's being tracked is not body, but the nature of arising and the nature of ceasing. In other words, change—impermanence, the universal characteristic of impermanence. What becomes the meditation object is actually the universal characteristic of change, and technically this is where insight meditation begins. Of course, if the universal characteristic of change is evident, then the other two characteristics are also evident: dukkha and not-self. But one may be more predominant, more obvious.

"Further, mindfulness is established as body is, just for understanding, just for continuity of mindfulness." Here we're talking about the radical simplicity of both the practice and the realization. The rain is wet. That's it. It's just this experience now, with no reference to anything else. It's not for anything. It's just what it is.

And then we have the final sentence: "And she lives independently, not clinging to anything in the world." This living independently is the maturity of the practice. Notice that what the Buddha is talking about is a way of life, not a meditation technique. And "not clinging" indicates there's nothing further to be gained. The destination of the path has been reached, and the practitioner has no sense of lack, of anything missing. The practitioner, you could say, is entirely intimate.

So let's get a sense of what this independence means. We start with where we are, which is before independence. We could ask the question: why do we undertake the practice? What are we doing here? We undertake the practice because we want something. We don't want what we have now; we want something better to replace it. Desire is the basis of effort. What this implies is that our relationship to experience is dominated by the sense of "what's in this for me? What do I get out of this?" We find ourselves habitually judging our experience to see whether it's good enough—and in particular, good enough to suit our agenda, to actualize the fantasies that we have regarding the future.

And this implies a relationship to the practice which is ruled by what the Buddha calls *taṇhā* and *avijjā*—craving and delusion. Because we're always pushing forward into an imagined future to get something that we think we're missing right now.

So this brings up our relationship to time, which we've talked about. When our practice is supported by a sense of something to be gained or something to be lost, time becomes real. We find ourselves resisting what is happening now because we think what happened before is more important, or what may happen later is more important—and even more real than what's going on right now. So we don't fully commit to what's happening now, because this now we see only as the prelude to something more significant.

But when we are intimate, this experience now is already enough. There's nothing more to gain. There's no thought of anything to come later, or even anything that happened before. Time dissolves, in the sense that any felt sense of past or future dissolves. And when past and future dissolve, of course the concept of the present dissolves, because the concept of the present only makes sense compared to past and future. So time dissolves, and we may even feel that there's no sense that anything alternative to this is even possible—and certainly it's not needed.

This is the kind of progression that the Buddha is talking about. And it brings in the sense of independence. "She lives independently." Now, this translates the word *anissita*. *A* means the negative—not *nissita*—where *nissita* means dependent on, attached to, supported by. And when we see this term, it's clear that what the Buddha was talking about is dependent arising. This is his basic framework, and it teaches that whatever we experience arises because of conditions other than itself. Whatever happens is conditioned by something else. In other words, it's dependent on, supported by those conditions. If this condition arises, this experience arises. But without those conditions, this experience will not arise. So this experience is dependent on these conditions, and the reality of a dependent event or experience is inseparable from the reality of what supports it.

For example, my sense of self. Now, this may come as a surprise to you, but I think I am real. In part because you think I'm real, and you treat me as if I'm real, and you are certainly real, and you're sitting around listening to me—so I must be real. Makes perfect sense, doesn't it? So there's the external support.

And there's an internal support: my thoughts about myself. Who I am, how I got here, what I'm going to do next—these thoughts seem real. The drama of my life and the emotions flowing through the heart, these seem to be real. So I must be real. And of course, my possessions seem real. These clothes seem real. This body seems real. And if they are real, they give me reality because I'm the owner of them. So the sense of self is dependent upon other events, other conditions, and it's a product of those conditions coming together. It is dependent. Does that make sense?

So the opposite is independence. How does the Buddha speak about this? There's one interesting little bit in Majjhima 22, the *Alagaddūpamasutta*, the simile of the snake. He gives the example of how the devas fail to find an awakened one, someone whose citta is fully liberated. He says that when the devas—including Indra, Brahma, and Pajāpati—look for a practitioner whose citta is liberated, they cannot get hold of anything that an awakened one's awareness depends on. So the devas, when they've got nothing better to do, are looking out in the world.

And they've heard about a practitioner whose heart is liberated, so they go looking. But they cannot find this person, because they cannot get hold of anything that an awakened one's awareness depends on. Why? Because an awakened one is unknowable right here and now.

So what he's saying is that an awakened one cannot be known. Because to know her, to find her, to establish her as real, we have to find what her inner state depends upon. What supports her inner state, her citta? What is her inner state grounded on? In other words, what does she cling to in her inner state? What does her inner state organize itself around?

The devas have a perception that is greatly superior to that of humans, and when they perceive a being, they look into their minds and they discern the personality that animates the body. But when it comes to awakened ones, all the devas can actually perceive is a body moving around—they cannot find what she is clinging to, what she is dependent upon, what she is supported by. In other words, they cannot find a command and control centre. They cannot find an identity headquarters.

So this brings us to what's happening in the citta, in the heart-mind. The essence of the citta is viññāna, awareness itself. And awareness is an elemental quality—it's not a something, but the presence of something. According to the Buddha, this elemental presence, which is awareness, grounds itself on a network of physical and mental qualities, organizes itself around them, and through them constructs an identity. The expression the Buddha uses is that awareness lands, and then it organizes itself and constructs an identity out of different physical and psychological phenomena.

This network consists of a unique sentient body with its characteristics, its possessions, its desires, its aversions, its obsessions, aspirations, and so on. These are the things that animate that sentient body and guide it through life. We call that network of physical and mental qualities the self. And in our own case, we identify with that particular network and we call it "me."

We get a sense of what this might mean when we think of people we know who are entirely predictable. Why are they predictable? Because they're caught in a network of habits, and they do not move beyond the network. Their awareness is grounded on, organized around, clinging to this network of habits, so they always respond in the same way.

But sometimes we meet people who surprise us, who seem to be quite different, for example, from who they used to be, or who seem capable of responding to life in ways that are not dependent upon the habits of the past. Their awareness also is grounded in and organized around a network of habits and qualities, but noticeably more loosely, so that they do not cling so tightly to their sense of themselves and the nature of the world that they live in. They appear to be much more adaptable to changing circumstances.

And if we take that to the end degree, an awakened one is not grounded anywhere. They do not cling to anything. Their awareness is not supported by, dependent upon, anything at all.

Let's look at another discourse, the Attirāga Sutta—Saṃyutta Nikāya 12.64. Attirāga means "if there is obsession." Here the Buddha is talking about how the normal human condition is one where our citta, the heart-mind, is disturbed by, even defined by, obsession, delight, and craving. Delight here indicates agitation. Technically, delight means, "Oh, this is so great, I've got to do it again!" Have you ever had that kind of experience? "This is fantastic, I've got to have another one." This is delight in the sense that the Buddha uses it.

So awareness lands—the Pāli term is patiṭṭhita—and it organizes itself around these qualities and constructs a self and a world that are characterized by grasping, aversion, and pain. This is the normal human condition.

But in this discourse, the Buddha goes on to talk about the alternative: when our inner state, our citta, is not driven by, not organized around, obsession, delight, and craving. And this is a very famous simile, often quoted. The Buddha is talking to his students and he says, "A roofed building or hall has windows to the north, the south, and the east. When light enters a window at sunrise, where would it land?" So you have the hall, and you've got windows to the north, the south, and the east, but not to the west. The sun rises, the light goes through the east window.

Where would the light land?

Now, the term that he's using for "land" is the same as when he talks about awareness landing and organizing itself. So the monks reply, "On the west wall, Bhante."

"If there was no west wall, where would it land?"

"On earth, Bhante."

"If there was no earth, where would it land?"

"On water, Bhante."

This is ancient Indian cosmology—the great ocean holds the great earth.

"If there was no water, where would it land?"

"It would not land, Bhante. It would not land."

So this is the unlanded awareness.

We have the saying "to see the light." But as we've discussed, we don't actually see light. We see what light illuminates, what light falls upon, what light lands on. That's what we see. But if light did not land anywhere, what could we say about it? Does the light exist? Does the light not exist? Or does concept fail? And if concept fails, what do we have?

This term translated as "unlanded" is *apatiṭṭha*. And we find the same term in its Sanskrit version as a key technical term in the Diamond Sutra. I don't know if you've come across that—if you're into Mahayana Buddhism, you've heard about the Diamond Sutra. It's very big in Zen, for example. And there the term is *apratiṣṭha*.

Let me give a brief quote from the Diamond Sutra, where *apratiṣṭha* is translated here as "unsupported." The Buddha says, "The Bodhisattva Mahasattva"—now, the Bodhisattva Mahasattva is an incredibly advanced practitioner; there's bugger all difference between a Bodhisattva Mahasattva and a Buddha—"the Bodhisattva Mahasattva should give rise to an unsupported heart. A heart not supported anywhere. A heart unsupported by sights, sounds, smells, tastes, tangibles, or phenomena." So he goes through the six senses. A bodhisattva mahasattva should give rise to a citta which is not supported anywhere—not supported by any of the six senses.

So this unlanded awareness and the unsupported heart, they're both pointing in the same direction.

Now, this is from the Sanskrit version of the Diamond Sutra. In the Chinese version, which is what is influential in the Zen tradition, we get a much simpler and different translation for this particular passage, where it says, "Dwell nowhere and bring forth that mind." And this is the phrase that sent the Sixth Ancestor, Huineng, off on his quest for awakening. Dwell nowhere and bring forth that mind.

So what can we say about this unlanded awareness, this unsupported heart? It exists, but it cannot be described. An awakened one exists but cannot be captured by concepts. It cannot be captured by anything we think or say about him or her. Because consider how description works. How can I describe X, whatever X is? Whatever I say does not capture X, because whatever I say is not X. It's a network of concepts about X. So no explanation can capture the actual lived experience. The citta of the liberated one exists—there really is liberation—but it cannot be pinned down by concept. And of course, this is true even of mundane concepts. No concept, for example, can pin down the taste of a good cup of coffee.

So this is a concept we find in early Buddhism, we find in the Theravada, but the people who really get to play with it are certain streams of the Mahayana. And here, let's have a look at how the practitioners of the Chan tradition played with this concept of unlanded awareness, or the unsupported heart.

Daowu and Qian Yuan went to a house to make a condolence call after a death in the family—in other words, they were going to the funeral. Now, of these two characters, Daowu is the teacher. Yuan, the student, hit the coffin. Bang! And said, "Alive or dead?" Wu said, "I won't say alive and I won't say dead." Yuan said, "Why won't you say?" Wu said, "I won't say. I won't say."

Halfway back, as they were returning to the monastery, Yuan said, "Tell me right away, teacher." The student had been stewing over this the whole time. "Tell me right away, teacher. If you don't tell me, I'll hit you." Wu said, "You may hit me, but I won't say." Yuan then hit him.

I get the impression that the people who got reborn as Chan monks must have been footy players in a previous life. It's all very macho and blokey—always biffing each other and shouting at each other.

Time goes by. After Daowu died, Yuan went to Xishuang and brought up this story. His teacher had died and Yuan had to find himself another teacher because he hadn't finished his training yet. But this business had been bugging him all this time. Years had gone by and it still bugged him. So he goes to this other teacher, Xishuang, and tells him the whole story.

Shuang said, "I won't say alive, and I won't say dead." Yuan said, "Why won't you say?" Shuang said, "I won't say, I won't say." At these words, Yuan had insight. He got it. After all those years.

Are you enlightened by this? Shall we just move on?

Basically, no description works. "I won't say alive. I won't say dead." These are just concepts. But what's happening is this: this is the world of non-clinging. And how is the world of non-clinging? The world continues to function. There's still seeing, hearing, smelling, tasting, touching, and minding. But while we are in a world of experience, we are no longer in a world of named experience. No concept works. No label of the experience convinces us because the label is not the experience. We cannot pin down the experience of not clinging as anything at all.

Later on we can look back and name it as something—"this happened." But we know that the name has already missed the named. We understand in real time the gap between what is actually happening and any name or concept that we place upon it.

Ordinary life goes on. We see, we hear, we think. But we learn to recognise that while our seeing, our hearing, our thinking are real, what we see, hear, and think are not what we think them to be. Our perceptions and our judgments—all of them—of what we are sensing are fundamentally wrong. They may be useful because they get us through the day,

But fundamentally, they are wrong because they miss the felt experience.

In that case, if they're wrong, then what is right? And as soon as we reach out to name something as right or as wrong, what we're doing is clinging to certainty—the certainty that's granted by concept. And in that clinging, we are stuck, and we are in pain.

But when we recognise that our name, our label does not match, that our concept is wrong, then we can relax. We relax into the gap of uncertainty. And this gap stimulates our curiosity. "I don't know—then what is it after all?" We are curious, investigation arises, and we naturally practise what the Buddha calls sati sampajañña, mindfulness and clear understanding.

But when we think we know, we fall back into habit, which means we fall back into habitual clinging. We are asleep. But when we know that we don't know, we stay alert, because we genuinely don't know what this is, or what happens next. So we have what Dōgen Zenji calls beginner's mind. And the beginner's mind is the mind of the mature practitioner.

If you are genuinely agnostic—most people who claim to be agnostic actually have all sorts of beliefs. Genuine agnosticism is quite difficult, to genuinely not know. True agnosticism means you can't say. But you can't say that you don't live. You act. And this

is very much what they emphasise in the Chan and Zen tradition—what's important is the action, not what you think you know. There's a beautiful expression about this: the finger pointing at the moon is not the moon.

So let's look at another illustration of this, another Zen story, which will be completely obscure, as they always are. This comes from Case 20 of the Book of Serenity: Luohan's Most Intimate.

This dialogue apparently—although there is disagreement about this—occurred after a three-month retreat. Now, in China at the time, the meditation monks and nuns would do two retreats per year, the summer and the winter, and each retreat would last two months. Then in between the retreats, they'd wander off and do other things. This system is still present in Korea.

Recently, we were visiting Korea and staying at a temple down south, in Jirisan, hanging out with some pretty senior meditation monks. They were talking about meditation, and I asked one of them, "What does it take to be qualified to be a meditation teacher in Korea?" He said, "Well, you know, between thirty and thirty-five years seniority as a monk or a nun, and about fifteen years of meditation practice." Now, by fifteen years, he didn't mean that for fifteen years you did some meditation. He meant literally fifteen years—two six-month retreats per annum, adding up to fifteen years' worth. The implication being, if you haven't done that, why would you pretend to be a meditation teacher?

And I thought, oh my God, no wonder they don't have a particularly high opinion of lay Dharma. It's a pretty high standard.

Anyway, so this story takes place at the end of one of these retreats. The teacher is Lohan, and he's saying goodbye to his students one by one as they leave. One of his students is Fa Yen, and Lohan has got his eye on this man. He thinks he's ripe—maybe he just needs a little push.

So Lohan asks Fa Yen, "Why are you leaving?"

Fa Yen said, "I am following the wind, wandering on pilgrimage."

Lohan said, "What does pilgrimage mean for you?"

Fa Yen said, "I don't know."

Lohan said, "Not knowing is most intimate."

Fa Yen suddenly attained great awakening.

I'll leave that one with you. Not knowing is most intimate.

Are there any questions? Presumably not—it's all as clear as mud. We're going to talk about that when we get to anatta.

So "clinging"—the word that gets translated as clinging is *upadana*. And *upadana* is appropriation, taking as one's own. *This is mine.* So this Dharma talk is mine. By the way, just in case you're in any doubt about it, this retreat is mine. This is *upadana*, and it results in self. But that's the executive summary. We'll talk more about it later in the retreat.

Question from participant about whether this relates to Dipa Ma's teaching that anger and fear still arise but without identification.

Yes, I think that's the basic territory we're talking about. The citta throws up what the citta throws up, but it doesn't stick. Of course, if you're a mature practitioner, then what the citta throws up—if you've cleared out all the rubbish, as it were—will be quite different from what it used to throw up. But the essential point is, from the point of view of the practice, it doesn't matter what the citta throws up. What matters is: do we grab onto it? Do we claim it as me and mine? Or do we let it go? It's just an event that comes and goes according to conditions.

I'll give you a very minor example. I was one time doing my own retreat, doing walking meditation around dusk, and suddenly the citta threw up an old obsession—I forget what it was. My first response was, "Oh my God, what's that doing here? That hasn't been around for the past twenty years. Have I not progressed beyond this?"

And then the absurdity of the whole situation struck me. It's got nothing to do with me. And it's got nothing to do with progress. When the conditions are such, these things arise. The conditions change, they go. It's not about me, and it's not about progress, and it's not about the lack of progress. When the conditions are there, this arises.

When the conditions change, they cease.

And in fact, it did cease—immediately. Because there was nothing to hold on to. There was nothing supporting it. There was nothing feeding it.

So one could go through all sorts of quite deep disturbances, but as it were, be untouched by it. And just let it flow through.

Thank you very much.

CHAPTER 48

Origins 1: The Quest for Awakening

Patrick Kearney · 54 min

In this opening talk of a series on the Buddha's first three discourses, Patrick Kearney traces the remarkable journey of Gotama before he became the Buddha. Beginning with historical context—Gotama was not a prince but the son of the elected president of the Śākya Republic—Patrick explores how a radical insight into aging, sickness, and death propelled the young Gotama into a life-changing quest for awakening.

The talk follows Gotama's training in the Upaniṣadic yogic traditions under teachers Āḷāra Kālāma and Uddaka Rāmaputta in the Licchavi Republic, his mastery of formless absorptions, and his subsequent rejection of these traditions as inadequate. Patrick then examines Gotama's turn to extreme asceticism (tapas) in Magadha, his competitive drive, his near-death from austerities, and his eventual abandonment of this path—scandalizing his five companions.

Patrick illuminates the Buddha's post-awakening hesitation to teach, his reflection that people are trapped in their positions (ālaya) and unable to grasp dependent arising (paṭicca-samuppāda) and nibbāna. The intervention of Brahmā Sahampati, the failed encounter with the Ājīvaka wanderer Upaka, and the Buddha's realization that he must be strategic in teaching set the stage for the historic first discourse. Throughout, Patrick draws parallels to practitioners' own journeys, inviting reflection on what obstacles we face in our practice.

Tonight we're going to start a series of talks on origins. We're going to look at the first three formal discourses given by the Buddha: the Dhammacakkappavattana Sutta, the Anattalakkhana Sutta, and the Āditta-Pariyāya Sutta. These mark the beginning of his teaching career, and these three discourses are considered extremely important by the tradition.

Before we look at the first one, before we get to it, we have to understand how the Buddha came to be teaching it in the first place. And for that, of course, we begin with Gotama.

As we've said, Buddha is a title, not a name. Before he was Buddha, his name was Gotama, and this was his clan name. In the early sources, we actually don't know his personal name. And that's true of a lot of the characters in the discourses. Sometimes they're called by their clan name—often they're called by their clan name—sometimes by nickname. But most of the time we actually don't know their personal names.

Gotama was the son of basically the president for life of the Sakya Republic. Later legend said he was a prince, the son of a king. He was not a prince, he was not the son of a king. He came from a republic. But he was a member of the aristocracy, and he would have been expected to succeed his father once his father died or retired.

When still young—and my personal hypothesis is that at this point he must have been a teenager, because that's the only way this story makes sense to me—Gotama saw aging, sickness, and death as if for the first time. In other words, he had some kind of radical insight in which he saw, for the first time, the depth of normal, everyday suffering. The kind of suffering that all sensible people were just taking in their stride. So the initial awakening is the capacity to be shocked by life. Seeing life as dukkha.

Now dukkha is omnipresent and it is inescapable, which means that anybody who lives a sane, meaningful life has come to terms with it. And so had Gotama, until the crisis hit. And now he recognises as a crisis, as something that has to be responded to, what everybody else sees as the obvious, the ordinary, the everyday. So he's radically out of sync with the world. And he's radically out of sync with his family, and in particular is radically out of sync with his father, who has the responsible job of being the President of the Republic and who expects his only son to succeed him.

Gotama is in conflict with the world, and perhaps most importantly he is totally, utterly unwilling to compromise. So in an action still scandalous, he abandons everything and walks out, including abandoning his wife and his newborn child. However, he does delay his departure until at the age of twenty-nine he actually fathers a son. And then he decides, that's it, I've done my job. I'm out of here.

Gotama is now the bodhisattva—the person or being, sattva, in search of awakening, bodhi. And his first problem is where to go. It's one thing to walk out the front door, but then where do you go?

His home is Kapilavatthu, the capital of the Sakya Republic, and this lies on the main trading route between the kingdom of Kosala to the west and the Licchavi Republic to the southeast. Kosala was the biggest of the new centralized monarchies, and its capital was Sāvatthī, which is where the Buddha later on made his centre of operations. The Licchavi Republic was the largest of the tribal republics, and its capital was at Vesālī.

So Gotama could turn west and head to Sāvatthī, or he could turn southeast and head to Vesālī. And he chooses southeast.

Why does he do that? Why does he head to the Licchavi Republic?

This area is what is now northern Bihar state, and it was the successor to the old kingdom of Videha. Videha had for centuries been a major centre for the yogic traditions that we know as the Upanishads. For example, it was in Videha that the Bṛhadāraṇyaka Upaniṣad was composed—one of the early, great Upanishads.

So during the Buddha's time, this was still an area where aspiring yogis would go to study and to practice. That's where Gautama goes, and he trains in the Upanishadic tradition under at least two teachers. We know there were at least two because the early discourses, the Nikayas, preserved their names: Ālāra Kālāma and Uddaka Rāmaputta. They must have been really famous at that time, for the Buddha's followers—who tend to disparage anything that wasn't Buddha Dharma—to include their names in their records.

According to Buddhist tradition, these teachers taught serenity meditation up to a high level of formless absorption. Formless means the material world has completely disappeared and the mind is in a subtle realm above the physical. This may possibly be a reference to the practice mentioned in the Bṛhadāraṇyaka Upanishad: the practice of silence, the silence that reveals the Ātman, the Self.

Gautama joins this tradition and practices with first one and then another teacher. What we learn about him is that he had a really fierce independence of mind along with a deeply competitive streak. This comes out in how he describes his relationships with his two teachers. Let's talk about the first one, Ālāra Kālāma.

Later on, the Buddha is telling the story to his students of his life as a student under Ālāra Kālāma, and he told them how he got himself geared up to really go for it, go for the practice. He says, "I consider: not only Ālāra Kālāma has faith, energy, mindfulness, concentration, and wisdom—I too have faith, energy, mindfulness, concentration, and wisdom." I think this is a polite way of saying, "I am at least as good as he is. And in fact, I could be better."

And so Gautama jumps into it, and in fact, he is very, very good. He does master these practices and the teachings. In each community, the teacher graduates him and says, "You've done really well. Please help out with the teaching. You've got a whole community here, and you've got something to offer. Please join in."

But Gautama rejects each tradition as inadequate. He refuses the request to contribute to the community. He walks away without looking back. And it would appear to be rather similar to his walking away from his family. Basically, he's not going to settle for anything other than full awakening, and he's not going to let anyone get in his way.

We don't know how long he spent in Videha—probably longer than the tradition cares to admit. But once he realizes there's nothing more to be learned there, he moves south. He crosses the Gaṅgā to the kingdom of Magadha, the second of the two major kingdoms in the Ganges Valley at the time. This is roughly south Bihar state. He goes to the district around the city of Gayā, a district known for its powerful and restless spirits, and for the shamans who dealt with them. To this day, it still has that reputation.

Here we see the shamanic side of Gautama coming out, an aspect that gets played down in the tradition. Are you familiar with the story of Sujātā and the Bodhi tree? This is later on, when he's on the home stretch toward awakening. He's meditating under this tree, and a young woman from the local village called Sujātā comes to make an offering to the deity, the spirit of the tree. She sees Gautama and thinks, "Oh, he must be the spirit. I should offer the food to him." Gautama, of course, does not explain that he isn't, that this is a case of mistaken identity. He just eats the lunch.

This story is variously interpreted, and these days a feminist interpretation is popular: Gautama is the macho young yogi, Sujātā is the feminine side, and when he absorbs his feminine side, then he can be enlightened. And, you know, why not? But if you look at it from the point of view of what was going on at the time, there were powerful spirits who lived in various places, including trees. If a village was making the point of worshipping the spirit, by worshipping it wasn't exactly, "Oh, we think you're so great and we're bowing to you. Wonderful."

It's take this, now leave us alone, and running away before anything bad happens. These spirits were powerful and dangerous.

Now Gautama, as a yogi, is looking for somewhere to practice. He's very familiar with this culture, and he's very sensitive—he would pick up the vibes. He's looking for a place to meditate, and he sees this tree. And he immediately knows this is the house of a powerful spirit. And he marches in and takes over.

Now imagine you're sitting at home in your lounge room. Suddenly the door swings open. This young macho bloke walks in, looks around, and says, "Yeah, this will do. Oh, you—ah!" It would be a bit of a shock.

So there he is. He's taken over the spirit's tree. But not content with that, he then steals his lunch. This is the powerful shaman. And it's the side of the Buddha that, as I said, the tradition tends to play down.

So anyway, Gautama takes up the practice of tapas—extreme asceticism. And the purpose of this practice is to summon power. It's all about power. The power necessary for the breakthrough to awakening.

Now India has a long tradition of cultivating what we call spiritual practices in order to develop power. In the literature, there's all sorts of stories about a yogi who would develop such power that even the gods would feel threatened by him. And then what you can do with this power is compel the gods to do your will. And so it looks like that during this period of his practice, Gautama's main concern was power.

Another aspect of Gautama's practice in this phase was that it was solitary. He wants no teacher and he wants no community. He's done with that. But he attracts five companions, and these are equally fanatical. These are also committed to this tradition. And the way it's talked about, it doesn't seem to be a normal teaching community with Gautama at the head as the teacher. It seems to be more like a loose association of people with no real ties to each other. The association seems rather like competitors running the same race. So the question is, who's going to get to awakening first? And there's a sneaking suspicion among the five that it's going to be Gautama. They want to be there when it happens.

So Gautama's austerities have this competitive edge. And this is coming out stronger and stronger. This is a quote that we've already given in an earlier talk. When he's thinking back about this period, he says to his students: "I thought whatever painful, wracking, piercing feelings due to exertion practitioners have experienced in the past, in the future, or in the present—this is the utmost. There is none beyond this. Yet I have not attained any status surpassing the human by this racking practice of austerities, any distinction in understanding and seeing worthy of cultivated ones."

Now you see from this that basically Gautama is in competition with himself and with others. And he stops only when he decides he has won the race. No ascetic, anywhere, at any time, could have beaten this.

The problem is, he's won the race, but he has not won the prize. And no one seems to be applauding. He has not won any distinction in understanding and seeing worthy of the cultivated ones.

So what he's then left with is another failure. There's a sense in which he already failed with Udaka.

But he thought, this isn't it. It's not what I'm looking for.

So then he jumps into this extreme practice to the point where he's close to death. And it still doesn't work. And Gautama quits. He walks away. And his companions are scandalized and angered by his desertion. I mean, what's he saying? Is he saying that they too are wasting their time? Or has he just given up because it's too hard? Either way, they are completely disillusioned with him and they walk away.

So they are rejecting him, but is he also rejecting them? Because again, he's walking away from the community that wants to share the Dharma with him in some way, even though in this particular group it's a bit weird. And this time he's absolutely determined. He wants no one getting in his way. He's going to do this alone.

At this point, it might be interesting to note that what Gautama is doing is employing what later became known as the mirror of Dharma, as we're talking about on Wednesday nights. He's looking into the mirror and asking himself, what's going wrong? And at this point in the retreat, it can be useful to ask ourselves: What's getting in the way now? Because what we want is momentum. We've been here a week. We're building up momentum. We want to be able to keep building on that. So it can be useful for us to check what is getting in the way now, and what do I do about it?

Anyway, let's get back to Gautama. So he's failed in the practice of yoga and he's failed in the practice of tapas. And so Gautama turns to developing his own way independently. The style of practice that he develops is what he later comes to call the middle way. And it worked. It leads him to awakening, to bodhi, under a tree that came to be called the Bodhi tree. And of course, the question is, why did he choose that tree? Well, it's pretty obvious. It must have been the power he felt radiating from it.

So he's awakened, and we'll talk more about this later on. Tonight is mostly story time. After the awakening, the Buddha—because now he's the Buddha—sits for four weeks at different places around the Bodhi tree, and what he's doing is quite feeling the bliss of deliverance. In other words, he's just had this incredible blast of enlightenment, and he's adjusting to it.

During the fifth week, when he's staying at the Goat Herds' Banyan tree, the newly minted Buddha thinks about the depth and the subtlety of what he has realized. And he says, "This Dharma I have discovered is deep, difficult to understand, difficult to awaken to, peaceful, exalted, beyond reason, subtle, experienced only by the wise. But people find pleasure in their positions, are devoted to their positions, delight in their

positions. And for such people, this is difficult to see: specific conditionality, dependent arising. And this is extremely difficult to see: calming all constructions, abandoning all supports, exhausting cravings, fading away of obsession, cessation, nirvana."

He is contemplating the depth of what he has realized and thinking about how difficult it is for others to ever comprehend it. And the reason why it's difficult for people is that people cling to their positions. This is ālaya.

So what does this mean? One way of viewing the mind's activities, which I must say I personally found useful at one point, is that the thought stream consists either of norms or positions. A position is a viewpoint that we cling to in order to define ourselves—to ourselves or to others. So it represents a foundation of what we take to be real and what we take to be self.

Now, a self for the Buddha is always defined by something other than itself—something that indicates itself, that points towards itself. And this is necessarily the case because the self does not exist as something directly experienced. This is the central aspect of the Buddhist teaching of not-self.

The self doesn't exist as something directly experienced. It exists as a concept, or as a network of concepts. The self always lies just beyond, or just behind, actual experience. And it exists only in terms of its reference—something it points toward, and which in turn points toward it.

So, for example, on a really basic level, possession. Possessions point towards the self. If I own something, that something confirms my reality as the owner. After all, the possession is real, and so the owner must be real. And this, of course, is understood by the advertising industry and by politicians, who often are selling us a sense of identity. Buy this car, and I am the trendy, happy person portrayed in the advertisement. Support attacks on refugees, and I am a true blue Aussie defending true blue Aussie women. The payoff in both cases is identity.

So when I take a position on something through thinking and clinging to these concepts, I create a self and a world that seems real and solid. The positions that the mind takes serve to concretize what otherwise would have no empirical reference—the self. Taking these positions and assuming them to be real and to point towards a real person blinds us to what is actually happening.

If we're in that state, we could not possibly grasp what the Buddha had just experienced: "The Dharma I have discovered is deep, difficult to understand, difficult to awaken to, peaceful, exalted, beyond reason, subtle, experienced only by the wise." Nevertheless, I'm going to advertise an enlightenment weekend—if you pay a lot of money, enlightenment is guaranteed.

People are stuck in their positions. How can they be persuaded to abandon all positions? It's way too hard. And so the Buddha decides that he will not teach, because it's just too difficult.

But fortunately for us, there's a certain deva, a Brahma—specifically Brahma Sahampati—who is at that moment eavesdropping on the Buddha's mind. He hears this thought and is horrified by it.

Now, why was Brahma Sahampati skulking about? During the time of Kassapa Buddha, the previous Buddha, Sahampati was actually a monk. He practiced under that Buddha's teaching, and after his death he was reborn as a Brahma, way up there. Our Buddha was also a student of Kassapa, and his name then was Jotipala. So Sahampati knew Jotipala, knew he was a talented chap, and just used to keep an eye on him over the lifetimes. He happened to be keeping an eye on him at that moment and realized, "Oh my God, he's about to wreck everything."

So he rockets down to earth and persuades the Buddha to teach on the grounds that yes, you're absolutely right about the Dharma being extremely difficult to teach and to understand, but he says there are just a few people "with little dust" who will understand if you teach them. If you don't, they will perish.

The Buddha is persuaded. But notice what he thinks he's signing on to—a tiny group of highly advanced disciples. The last thing on his mind is that he's about to start a world religion. That was definitely not part of his agenda at this point.

The Buddha thinks first of Alara Kalama and then Udaka Ramaputta, his teachers. Perhaps they could get it. But the devas inform him that they have died. The tradition says Udaka Ramaputta died the day before, and Alara Kalama about a week before.

I think about the Indian idea of life after life of practicing to attain enlightenment. These teachers had attained a tremendous spiritual status, but not awakening. A Buddha pops up, and they just missed him. They were reborn in heavens so remote and so subtle that they don't even know that Buddhism ever appeared on earth.

And they're going to be sitting in that heaven for about a zillion years. Then by the time they're reborn, there'll be no Buddhism. They just missed out. So don't miss out.

The Buddha then thinks about his five former companions. Perhaps they would understand. But why was the Buddha initially unwilling to teach? It was certainly the difficulty of understanding the Dharma. Yet when he was reflecting on this, what else was he thinking? Was he also thinking of his younger self? Was he thinking of how fiercely he had clung to his own positions? Is he thinking now about how fanatical his five former companions are, and how difficult it would be to get them to see the world differently?

When Govind thought about his conflicted relationships with his family, his teachers, his companions, and when he thought of his stubbornness in pursuing the dead end of asceticism, did he think of how difficult he himself had been to teach? Was this movement towards the first teaching an attempt to find a breakthrough—in the sense that if he could find a way to teach his former self, in the form of his old companions, then he could teach anyone at all? If he could crack this nut, he could do it.

So he decides he's going to give it a go. Again, the devas helpfully inform him that the five companions are now living just north of Varanasi. The Buddha heads there in search of them. He hasn't gone very far—in fact, he hasn't even arrived at Gaya—before he meets Upaka coming down the road.

Now, Upaka is also a renunciant. He is an Ajivaka, and the Ajivikas were an early Indian sect that taught determinism. Upaka is walking along the path when he sees this young Buddha walking towards him. He's really impressed by what he sees. He stops the Buddha and says, "Friend, your faculties are clear. Your complexion is pure and bright. Under whom have you gone out? Who is your teacher? Whose dharma do you follow?"

The point about this encounter is that it is entirely unrehearsed, unprepared for. The Buddha has his mind focused on the companions. He's not expecting this. So he responds purely spontaneously in what's called an *udāna*, a spontaneous verse. I'll go through much of it, just to give you a sense of it.

The Buddha says: "I am one who has overcome everything, who understands everything, unstained among all phenomena, abandoning everything, free by putting an end to craving, having understood directly by myself—to whom should I point?" In other words, who's this teacher you're talking about? "For me, there is no teacher, and one like me is unknown. In the world with all its deities, there is no one equal to me. I am the worthy one of the world. I am the supreme teacher. I alone am *Sammāsambuddha*. I am cool, extinguished. To turn the wheel of Dharma, I am going to the city of Kasi. In a world gone blind, I go to beat the drum of the deathless."

This is a very famous verse. Upaka responds by pointing out that this is quite a claim. The Buddha agrees. Upaka shakes his head, Indian style, and says, "Yeah, friend, maybe." And he walks off.

This expression would be equivalent to our "yeah, whatever"—or even the Australian expression, "yeah, no." In any event, he's completely unimpressed, and he walks away.

This declaration by the Buddha is inspired,

spontaneous, completely unplanned. His heart is full, overwhelmed by the good news. But Upaka is not moved.

So as the Buddha walked away, he must have been thinking, "That went well... not." In other words, he's realising that he has to be very careful, very strategic, in how he speaks, if he is not going to drive people away rather than persuade them to open up to what he's got to say.

And so he's on his way to Kāsi, to Bārāṇasī, wondering how on earth he is going to handle his five companions. And we shall find that out tomorrow.

So, any questions?

Yes, his name was Rāhula, according to tradition. Seven years after he left home, the Buddha returned. And he had, well, let's say his father was really pissed off. Seriously pissed off.

So he and his dad are having a bit of a flaming blue in the courtyard, and his wife is upstairs. She looks down and sees her husband has come back, dressed as an ascetic. Then Rāhula turns up, looks out the window and says, "Who's he?" And his mother says, "That's your father." Then she says, "Go down there and ask him for your inheritance."

Now why she wanted him to do that, who knows what's going on in her mind. But the boy does. So he marches up to his grandfather and his father—they're having a blue, and I'm showing you the footage, it's very polite. And he looks up at his father and says, "Where's my inheritance?"

And the Buddha looks down and turns. He's brought with him some of his students, and he says to Sāriputta, "Ordain that boy now." So basically, he kidnaps his son. And his father is even more pissed off.

So Rāhula goes off and becomes a novice monk, a sāmaṇera. And there are two teachings, two suttas, in which the Buddha teaches his son—one when he was still very young, and the other when he was twenty, when he was ordained as a bhikkhu.

And then Rāhula disappears. There's no mention of him. He disappears. And he's highly respected in the tradition for this. Because as the son of a Buddha, he could have made a play for power. He could have said, "I'm the enlightened one's son. Enlightenment comes to me." And he was enlightened—he was an arahant. But he didn't. He just vanished. Not heard of again at all. And the tradition really respects him for that. They feel it demonstrates his sincerity.

Well, according to later Buddhist thinking, exactly, he would have. But according to the early tradition, definitely he didn't. And these stories come from the Vinaya Piṭaka, the Mahākhandhaka. This is the earliest history that we have of the formation of the Saṅgha—very early. So it was composed way before the theological constructs of bodhisattvas wanting to rescue everybody came into being.

The record that we have shows him basically saying to himself, "If I try to teach and nobody understands, this is going to be a real bother. So I won't do it." And he had to be persuaded.

No, it's scandalous. There is a later interpretation that, oh, this is just play acting—Brahmā was coming down just to illustrate some kind of teaching point. I don't think so. I think we can see here stories that don't fit the orthodoxy, something that was never ironed out. So the early records went through an editorial process.

And every now and again, something comes out that doesn't seem to fit the image. But you can be pretty sure that if it wasn't edited away, it was because everybody knew—no, this actually happened. And we can't just rewrite history, even though it would be less embarrassing if we did.

So the Shakyas lived in a republic. The Kshatriyas, the upper class, they had a vote—something like the Roman system. There would be an assembly, and all the major decisions were made in that assembly. Every member of the community had the right to speak publicly and to vote. So there would have to be debates. But "every member" meant male aristocrats of that status—not all men, just those of that particular status. And the president was elected.

There's no mention of terms, and it would have been probably unusual to have them. So his father expected that the young Siddhartha would take over, but he would have had to be elected as well. He would be presented to the assembly: "This is my son. I've been your leader, running this republic for decades. You've done well under my

guidance. Vote for him." And everybody would likely say, "Yep, okay." Presumably that's how it would have gone. But he would have had to have earned it. If he had been hopeless, they wouldn't have elected him. So there would have been a lot of pressure on him to do well.

After his father died, they elected Mahanama—he was a cousin, part of that same broad family, a cousin of the Buddha. He became the last president, because the Shakya Republic was destroyed either soon after the Buddha's death or just before it.

Did his father and the Buddha ever resolve their differences? There's no indication that they really did. His father complained to him about Rahula's ordination, and the Vinaya rule about how old a boy must be before being allowed to ordain as a samanera was instituted because of his father's complaints. I think the rule is something like: if the boy is old enough to throw stones at birds in the fields, he's old enough to ordain. In other words, if he's old enough to enter the workforce, he's old enough to ordain.

His mother died a week after he was born, but his mother's sister raised him. And she eventually went off and ordained. A lot of his family ordained—a lot of his cousins. In fact, the Shakyas constituted the elite, the governing elite, the people who ran the Sangha. It was largely a family enterprise, which would have been typical for the time. That probably would have really irritated his father—it would have got right up his nose.

As for his wife, I can't recall whether she went off and ordained as well. I don't think so, but it's possible.

Or it could be that she was telling him, look, this is your opportunity—go for it. Who knows? All we've got is the story.

Now, regarding Viḍūḍabha—after Pasenadi of Kosala was very old, he was overthrown. The prince was a Shakya, the son of a woman whom the Republic had sent to Pasenadi a long time before. There's a very strange story in the Buddhist tradition about why this happened, which I think is complete nonsense.

But at the time, we have two major kingdoms, and the modernizing one is Magadha. When the Buddha passed through, the king was Bimbisāra, who became a follower of the Buddha, and Buddhism was well established in Magadha. In ancient Indian history, the most common cause of death for kings was to be murdered by one of their own sons, impatient for the top job. That's what happened to Bimbisāra. His son was Ajātasattu, who appears in the later stories. Ajātasattu had a plan for imperial expansion. He launched a war north of the Ganga, destroying the Vajjian Republic, and he faced off with Kosala.

By the time the Buddha was old and coming to the end of his time, it was pretty clear that the whole political balance of power in the Ganges Valley was coming unstuck. These two elephants, Magadha and Kosala, were going to be trampling at each other and trampling everybody else.

Now, if you were a young, ambitious king of Kosala, maybe you would see an opportunity. The other thing about Kosala was that it was an old-fashioned kingdom, quite feudal. Different rajas ran their own domains but answered to the king in sovereignty. The Shakya Republic was one of these—autonomous but answering to Kosala. It was rather like Australia and the Crown. This kind of very loose confederation, maybe the king thought, isn't good enough. "I've got to have everybody under my control, and I'll start with these people. They occupy a highly strategic position, and they have a reputation for independence. I'll make an example of them." I suspect it was something like that. Power politics is power politics.

Regarding the question of enlightenment before the Buddha—there would have been ideas about enlightenment from the Upanishadic tradition, but they had the concept of Ātman and Brahman. You realize that Ātman is one with Brahman. They have a whole theology out of which the non-dual tradition emerged. But it seems the Buddha wasn't convinced. He studied it, he did the practices, but he thought, no, this isn't it. He had very high standards. It took a lot before he was satisfied.

As for the question about whether there were Buddhas before Gotama—yes, the tradition holds there were past Buddhas who were regarded as enlightened with the same status. I think there were five or seven of them listed in the early sources. But in the later tradition, they extended the cosmology out considerably.

There are an infinite number of Buddhas before and an infinite number of Buddhas after. But we don't know when that tradition began, at what point people started talking about previous Buddhas. In the early tradition, they do talk about previous Buddhas, but they all teach the same thing—they teach the Dharma.

The difference between our Buddha and the previous Buddhas was that our Buddha took a long, long, long time to become enlightened. According to the tradition, it took him six years. Can you believe it? And apparently this is because when he was a student of the previous Buddha, that previous Buddha was talking to his students about how long it had taken him to be enlightened—how after he left home it took him six days to be enlightened. And our Buddha, who at the time was a bodhisattva, thought, "Six days? I'd be at this for six years." And because of that misplaced determination, he took six years.

What happened to the previous Buddhas' knowledge? They're gone. Impermanent.

So the reason we have the Buddha's teaching is because he got convinced to teach. But it wasn't just that he decided to teach—the thing is, he was a brilliant politician and organiser. Because he didn't just teach. He created a structure that has lasted for over two millennia.

The Vinaya, the legal code that governs the life of his monks and nuns, is one of the oldest continuous legal traditions on the planet. That's the Vinaya that determines the life of the monks and the nuns—the code of discipline. Lay people aren't exposed to those legal codes; lay people have the five precepts, the Panchasila, which we chant each night. But the monks and nuns were very regulated in their life. And that code, that legal code, is one of the oldest continuous legal codes on the planet. That's an astonishing cultural achievement. So he wasn't just enlightened—he was a genius as well.

The stories of the previous Buddhas are couched in a culture and cosmology about the yugas, about how many thousands of years humans have been on the planet and the different cosmic ages. This reflects the Indian sense of time. And we don't know if there have been other planets or worlds where there have been other Buddhas. But the stories of the previous Buddhas are expressions of that worldview. There is the Indian sense that birth is followed by death, death is followed by birth, and it just rolls on. And there's no reason to suppose that it's limited to this little piece of galactic real estate. So they have a very big picture of life and the universe.

You get the Jataka stories that began to develop—these are stories of the bodhisattva's companions in previous lives. They're very famous stories, Indian folk tales. But if you look at these stories, in theory they represent the Buddhist world projected back in time, a long time ago. And if you look at the political, social, economic structure in those stories, they're exactly the same as in the Buddha's time. In other words, for them, the past was simply the present projected backwards. But in modernity, you know you can't do that.

The past is not the same as the present—it's different. And so you have the invention of history, which says the past is definitely different and asks how we can understand it.

One of the fascinating things about these early Buddhist records is that they actually are history. Many of them are people reporting what happened in their own lifetime—how all of this started—and keeping those records. So we're witnessing the beginnings of history as we know it. But when you look at their stories of the distant past, that past is always simply the present projected backwards. In other words, they invented it.

Question from the audience: At the beginning of the talk, you were describing identity and used an example about buying something. Can you remind me how that relates to your teaching?

When the Buddha was considering whether he should teach, he said he couldn't because people are locked into their positions—*ālaya*. This is where the mind takes a position on something, and verbally it functions to concretize the self and the world. This, of course, comes out later when he starts teaching not-self, which at this point he hasn't yet mentioned. But we're going to explore not-self later in this series.

Question about vegetarianism.

There's a strong tradition of *ahimsa*—non-harming—in India. Not harming any living being. So many people were vegetarian. But the Buddha was not into food trips. And particularly for his monastics—monks and nuns—they were beggars. He rejected making vegetarianism part of the monastic rules, essentially because it would make life more difficult for the lay people. There would be certain foods they couldn't offer and others they could. And it would introduce the monks and nuns making choices about their diet. If you ordain in the Theravada tradition, one of the things you abandon is any control over your diet. Someone offers it to you—that's what you receive.

Question about reintegration and why we are split.

That's a good question. We're going to talk about life after life later in this series, although discussing it now might just create more fixed positions, so I really shouldn't go into it.

Anyway, it's getting late. Thank you very much.

CHAPTER 49

Origins 2: The Middle Way

Patrick Kearney · 43 min

In this talk from the 28-day Satipaṭṭhāna retreat, Patrick Kearney continues exploring the Buddha's first teaching by examining the Majjhimā Paṭipadā (Middle Way) as presented in the Dhammacakkappavattana Sutta (SN 56.11). The teaching unfolds through the dramatic context of the Buddha's encounter with his five former ascetic companions who had rejected him for abandoning severe austerities.

Kearney illuminates how the Buddha discovered the Middle Way through a pivotal childhood memory of spontaneous jhāna under a rose-apple tree. This memory prompted the revolutionary question: 'Why am I afraid of pleasure that is unconnected to sensual stimulation?' The Buddha realized that both the pursuit of sensual indulgence and the pursuit of painful asceticism share the same fundamental problem—taṇhā (drivenness, craving). The ascetics' mistake was believing that pain, as the opposite of pleasure, must be the correct path. But being driven by aversion is no different from being driven by desire.

The Middle Way is revealed not as mere moderation or a fixed point between extremes, but as a dynamic balance where no fixed position is taken. This is expressed through the Noble Eightfold Path's complex interrelationship of eight factors across three subsystems (sīla, samādhi, paññā). Each factor must balance with every other, creating what Kearney describes as 'dynamic complexity.' The practical implication for meditators is profound: whenever we take a fixed position—straining toward a goal or collapsing in exhaustion—we lose the Middle Way. True pleasure arises from the absence of drivenness, available only in complete absorption in the present moment.

Last night we started to tell the story of the newly minted Buddha. We talked about his quest for awakening, which eventually ended in success. This happened on the full moon of the lunar month of Vesākha, which roughly corresponds to our May or June. The first discourse, the *Dhammacakkappavattana Sutta*, or Rolling the Dharma Wheel, was delivered two months later on the full moon of Āsāḷha, roughly July. This is in the lunar calendar, so it doesn't quite correspond. In this first discourse, he taught the middle way and the four truths. This gets the whole ball rolling, and tonight we're going to look at the middle way—the *majjhimā paṭipadā*.

If we go back earlier in the story, the newly awakened Buddha at first does not want to teach, because he feels that the Dharma he has discovered is too deep, too subtle, too profound for anybody else to actually understand. He says, "This Dharma I have discovered is deep, difficult to understand, difficult to awaken to, peaceful, exalted, beyond reason, subtle, experienced only by the wise."

But as we know, fortunately for us, an eavesdropping deity, Brahmā Sahampati, overhears his thought, appears before him, and pleads with him to teach on the grounds that there are just a few people "with little dust" who will understand if he teaches them. But if he doesn't teach them, they will perish.

And so the Buddha decides he's going to start with his five former companions. They were with him when he was practicing asceticism, but their communities split apart when Gotama abandoned that practice. Off the Buddha goes to try it and see, but his first attempt ends in disaster. He hasn't even reached the city of Gayā yet when he meets the ascetic Upaka, who shows interest in him and in his Dharma. The Buddha responds with an *udāna*—a spontaneous, inspired poem. We give just one verse of it to offer a flavour:

I am the worthy one of the world.
I am the supreme teacher.
I alone am Sammāsambuddha.
I am cooled, extinguished.

The "cooled and extinguished," by the way, refers to Nibbāna. Upaka, as we saw, was not impressed, and he leaves.

This leaves the Buddha with a problem. How will he find a way to convey his teaching to others? And in particular, how will he convey it to his five former companions who have walked out on him and are really quite unhappy with him? Presumably, as he walked to Vārāṇasī and then from there north to Isipatana, he was thinking about this.

Eventually, two months later, he arrives where the five companions are practicing. He rolls up and basically says, "Okay lads, I've done it. I'm enlightened. Gather around and I'll tell you the story." They do not want to listen. They want nothing to do with him. They were disillusioned with him when he turned away from asceticism. They see him as a backslider, a lover of luxury—also known as lunch. From being a champion of the practice, he's now a threat. They refuse the respect they would normally offer him. They're not impressed by his declaration of awakening, and they're not impressed by his offer to teach them.

There's a bit of to-ing and fro-ing as he tries to persuade them. Finally, he says to them, "Have you ever known me to speak like this before?" They say, "No, we haven't." It reminds them—they know him. They don't particularly like him, but they do know that he would never lie. If he says he's attained awakening, then at the very least, he thinks he's attained awakening. At the very least.

So the declaration of truth moves them to the point where they are prepared to agree to listen. Now, the Buddha made a much more poetic declaration of truth to Upaka, and it didn't work. It seems that the power of truth is in part dependent upon the context. Here the context is that they know him, and they know he would not lie.

So the Buddha begins by teaching the middle way.

Now we're going to read out the discourse, but again, notice that these recorded words are not exactly what the Buddha would have actually said. These are an executive summary bundled up for chanting and memorization—rhythmic repetitions and so on.

In what we have recorded, he says: "These two extremes should not be followed by one who has gone out into homelessness." So this is someone who abandons the world and heads out to practice. What are these two extremes? "The pursuit of sensual happiness among sensual pleasures, which is inferior, normal, the way of ordinary people, lacking in refinement and useless. And, on the other hand, the pursuit of the practice of self-exhaustion, which is painful, lacking in refinement and useless. Avoiding both these extremes, the Tathagata has awakened to the middle way."

Now, Tathagata is a title that the Buddha used to refer to himself. We won't go into it deeply, but basically it means an awakened one. "Avoiding both these extremes, the Tathagata has awakened to the middle way that gives rise to seeing and understanding and leads to calming, direct knowledge, full awakening, Nibbana. What is the middle way that gives rise to seeing and understanding and leads to calming, direct knowledge, full awakening, Nibbana? This eightfold path of the cultivated one: right view, right aspiration, right speech, right action, right livelihood, right energy, right mindfulness, and right concentration."

So this is the presentation, and what we need to do is unpack it. Notice that the eightfold path is the eightfold path of the cultivated one, of the noble one. Why would I translate it that way? In this world, how many Noble Ones are there at this point? This is an Arya—a Noble One, a cultivated one, a refined one, a developed one. There's one: the guy who's talking. So basically he's saying, "This is my Noble Eightfold Path. This is my eightfold path."

He opens up with the middle way. Now the middle way is the Buddha's strategy to teach the Dharma. Context is everything. And one of the reasons why the Buddha was so respected as a teacher was that he had an uncanny ability to adapt his teaching to suit the specific characters and needs of his audience of the day—unlike me, who just rattles off abstract, learned stuff and doesn't care who's in the audience.

In the situation that the Buddha faces here, he needs to be very careful because he needs to find a way to penetrate through his listeners' defenses against hearing the truth. Why is the Dharma so hard to understand? The Buddha may have realized the difficulty of communicating the Dharma from reflecting, for example, on his first realization of dukkha when he was a young man. He suddenly saw the universality of aging, sickness, and death. In other words, he saw what everyone sees, but he was suddenly and unexpectedly stripped of the normal layers of defenses that we all have when we're faced with this.

It's these defenses, of course, that enable us to function within the world. So if we drop our armor, we could find ourselves suddenly exposed to a reality that could drive us mad. In his case, when he was very young and he suddenly had this profound and shocking realization, how could he have communicated this vision to his family? How could he have possibly done that? How could he have penetrated their defenses? Especially since at that time he had no understanding of what was happening to him. He just knew he had to do something about it. So of course he couldn't communicate it.

Now, when he arrives at Isipatina and is facing the five companions, he's dealing with people who do understand the existential problem. But what they do not understand is the way out of the existential problem. And what makes them particularly difficult as an audience is that they think they know the way out of the existential problem, when in fact they don't, because they're completely mistaken. So this audience is a really hard nut to crack.

This particular audience consists of practitioners of the path of tapas—not the Mexican food. It's a Sanskrit word, and essentially it refers to severe asceticism. The word tapas in Sanskrit means warmth, heat, fire. What it refers to is the burning away of one's past karma, and in particular doing this through voluntary suffering. Tapas is also associated with the generation of power, the power that fuels liberation, and hence its connection with shamanism.

So the Buddha's companions, his former companions, are practicing to overcome dukkha, pain. And they believe that the opposite of dukkha is sukha.

So sukha is happiness, bliss, satisfaction and so on. And they believe that sukha comes from the capacity to endure dukkha, and so transcend it. They hold this view because sukha is the opposite of dukkha. The Buddha's job is to cut through this particular delusion and show his audience something new that had never occurred to them before. And he has the advantage that he does understand them, because he shared the same beliefs and the same practices.

When he was an ascetic, Gautama believed that what holds us back from our awakening is our attachment—in particular, our attachment to pleasure. So for him and his companions, pleasure was the enemy. Eventually he came to realize that we can be just as stuck on our pain as we are on our pleasure. The problem is not the pleasure; it's the stuckness.

This realization came out of his failure as a practitioner of the ascetic path. Which, by the way, I think is a universal lesson for the practitioner: often the best lessons emerge out of failure.

When he was practicing asceticism, he felt that a measure, a standard of his success was his capacity to endure what the texts call "painful, wracking, piercing feelings because of exertion." We quoted this when we were talking about finding right effort. The more pain, the better. And this is how, years later, he described to his students the practice he was doing when he was young and completely deluded. Again, we quoted this before: "I thought, suppose I clench my teeth and press my tongue against the roof of my mouth, and then beat down, control, and crush mind with mind. So with my teeth clenched and my tongue pressed against the roof of my mouth, I beat down, controlled, and crushed mind with mind. While I did so, sweat ran from my armpits."

Now we looked at this before and we asked the question: why was Gautama practicing in this way? Why was he crushing mind with mind? Because he was driven by the desire to get the result that he was looking for. He was using the power of his will to take hold of the object of his desire—awakening.

What he had since come to realize was that the source of our dukkha is what he now came to call tanha. Literally this means thirst, normally translated as craving. Essentially, it's drivenness. Tanha is shorthand for the state of being driven. Gotama's practice was stuck in his drivenness, and it was this very drivenness that fueled his practice and created his dukkha. He was stuck in this loop.

What moved him forward was a spontaneous memory of the pleasure of his childhood and a question that came from it. This was after he gave up asceticism, when he must have been seriously reflecting on what went wrong. Spontaneously, a memory of his childhood popped up. And at the center of it was a question: Why am I afraid of pleasure?

This is the earliest instance we have of this very famous story: "I remember that when my father, the Shakyan, was occupied, while I was sitting in the cool shade of a rose-apple tree, withdrawn from sensual pleasures and unwholesome states, I attained and lived in the first jhana, which is accompanied by applied and sustained application, with rapture and pleasure born of seclusion. Could this be the way to awaken?" Then, following on that memory, came the awareness: "This is the way to awaken."

What he's describing is a spontaneous concentration state that occurred as a child, sitting in the cool shade, watching other people working in the hot sun. You can understand how that's really pleasurable. Now, the way it's expressed is by using the standard formula for the first stage of meditative absorption. But the way an oral tradition works is it takes a formula and inserts it in an appropriate place. So whether he actually thought of it in that memory, whether he actually conjured up in his mind the technical characteristics of what he later came to call the first jhana—maybe not. But maybe he just had the sense of: Yeah, I just stepped back from all the stuff that I'm normally involved in. Body was at ease. Mind was at ease. And this absorption in the present just popped up. There it was.

And then he adds: I thought, why am I afraid of pleasure that is unconnected to sensual stimulation and unwholesome states?

So here he asks the question, but in particular he's talking about a particular kind of pleasure—pleasure which is unconnected to sensual stimulation and unwholesome states.

Now, what I translate as "sensual stimulation" is *kāma*—K-A-M-A with a long A, not *karma* with an R. This word indicates pleasure that is stimulus-driven. This is its characteristic. Normally it would be translated as "sensual pleasure," but the point about it is that it's stimulus-driven, entirely dependent upon a temporary stimulus.

Such a pleasure is first of all inherently agitated because it needs the sense stimulus, and it can only be maintained by constant repetition of the stimulus. But this constant repetition ends in boredom and flatness and dullness. Sensual stimulation also involves a restless movement from one sense object to another to another, because any one of them just gets boring after a while, and it's time to move on.

All of this restlessness and stimulation indicates *taṇhā*—drivenness, thirst, craving. And so now Gautama realizes that doesn't work. That's not really all that pleasurable. Gautama is looking for pleasure, but a pleasure that is free from *taṇhā*, free from drivenness.

He came to his new understanding of pleasure through his memory of childhood, long before he had ever thought of awakening. And so this new relationship to pleasure, which he is rediscovering, has a childlike quality of spontaneity to it—a willingness to accept what the world has to offer before disillusionment, so that grasping is not only unnecessary but as yet not even conceived of.

Gautama's project becomes how to return to that relationship to pleasure in the world as an adult.

Now, this is a pleasure that is simple and already available, but it's hidden. It's obscured by our narcissistic obsessions. And in order to find it, we have to drop our self-enclosure, our self-obsession, and open up to what is already here—provided, as it were, by grace, as a gift. It's in this spirit that he worked out the Eightfold Path.

An example of this pleasure—actually, I've been enjoying it for a while—when I stepped out of the veranda into the garden and the cloud was moving in. We're in the cloud. The air is cool. The garden is beautiful. The light is really subtle. Just walking down the steps. That's pleasurable. And the point is, it's a pleasure already available. I didn't have to do anything to look for it, to seek it. It's just here. This is the kind of pleasure that Gautama was interested in. How do I cultivate that pleasure?

Now the implication, if we're coming to the Eightfold Path, is that for the practitioner, the path itself must be pleasurable in the sense of generating contentment. If we're going to get through a month's meditation, we could do it through willpower—by leaping upon our meditation object, wrestling it to the ground, and any time it shows signs of trying to slip away, just pounding it into submission. We could do it. For some people it might even work if they've got really strong willpower. But wouldn't it be better to cultivate contentment within this context?

When we're contented, we don't have any felt need to look beyond this now. This now is actually fine. It's actually pretty good. So we're no longer concerned with a result which may or may not arise in the future. Path and destination are not radically separated. The practitioner feels that the path already contains the destination.

In contrast, when Gautama was crushing mind with mind, he must have been looking for something that would happen next as a result of his efforts. But now he's realized that a whole different relationship is necessary—one where awareness is so completely absorbed in the present that any sense of a future result can be forgotten.

In fact, it is forgotten. A quality of absorption that has no need to look to an imagined future means something is no longer missing now.

Pain feeds aversion, and aversion always fuels the need for something else to happen—for example, in the future. Pleasure cuts through aversion, but it too can be very sticky. When we feel pleasure, we want to control it. We want to extend it into the future. We don't want it to go away. And then pleasure feeds attachment. We're stuck.

So what we need, from the Buddha's perspective, is pleasure without clinging—where clinging expresses itself often as swings between aversion and attachment. Like, don't like. Like, don't like. Now where can we find this pleasure? We can find it in the middle way. This is largely the purpose of the middle way.

The Buddha says that the middle way is located between asceticism and indulgence. Notice what they both have in common: they are both driven by taṇhā. Or simply, they are both driven.

Now the five companions have already rejected the extreme of sensual happiness, so the middle way is presented here as an alternative to asceticism. What does it look like from that perspective? Nothing about pursuing pain, and everything about cultivating a sense of balance.

Let's look at the first extreme, the pleasure extreme, which for the Buddha and his companions revolves around the home life. Home life turns around the issue of sukha, the pursuit of happiness. We can see this in our culture, exemplified in the practice of consumerism. Happiness comes from having more. It comes from being more. It's fascinating that when people speak about rich people and want to say how much money they've got, they talk about their "personal worth." Isn't that a bizarre expression? Personal worth? We won't go there, but it's very strange.

The ascetic path begins with the realization that this path—the path of the pursuit of pleasure, let's call it consumerism—does not work. In other words, the realization that the destination of the path consisting of the pursuit of pleasure is pain. That's where it ends up.

This realization is counterintuitive, and the people whose path is based upon it have to realize that they're part of a very small cultural minority. There's a certain stubbornness contained in this practice. Only the most fanatical pursue this path—the path of the pursuit of pain. Remember, this pursuit exists because it's the opposite of the path of the pursuit of pleasure.

But the problem is this path is wrong. Now it should be right. As far as the pain is concerned, this should be the right path because it is the exact opposite of the wrong path, the path of consumerism. So it should be right, because it's the opposite of the wrong. But this is what the practitioners miss: it's wrong because it's the opposite. Because this is an aspect of anta, of extreme.

When the Buddha talks about how the Tathāgata has avoided the two extremes, the word he uses is anta. One of the meanings of anta is extreme, but another meaning is opposite. The ascetics are trying to overcome pleasure by pursuing this opposite, pain. But all that meant was that instead of being driven by attraction, by desire, like everybody else, they're being driven by aversion.

But they're still driven. And therefore they're still bound to dukkha. Because it's the drivenness which is the problem.

So the fundamental problem is not pleasure and it's not pain. The problem is drivenness. Because it's drivenness that causes us to become stuck—in either what gives us pleasure, or equally in what gives us pain. And drivenness brings pain. Real pleasure comes from the absence of drivenness, the absence of stuckness.

So this new understanding of pleasure and pain lies at the heart of the four truths and the middle way. This is the middle way that the Buddha is presenting.

And if we ask, where can the middle way be found? Well, first of all, the middle way cannot be defined as an opposite of another way. Because that's just another extreme—it's not a middle.

Often the middle way is presented as moderation. So let's imagine you have a ruler. One end is one extreme, the other end is the other extreme, so the middle way must be dead set in the center. But of course, dead set in the center is just the opposite of the two ends. It's just another opposite. It's just another extreme.

The opposite of indulgence is asceticism, and that doesn't work. And the opposite of asceticism is indulgence, and that doesn't work either.

We can get a sense of this in the problem of effort. If you find yourself making effort in the meditation practice, and you find yourself in particular making too much effort—strain—well, how do you know that you're straining? A pretty good indication is the felt need to take a break. Have you ever felt the need just to take a break? Straining is an anta, an extreme. But taking a break is just another extreme—it's just the opposite. And this tends to be the pattern in our practice: strain, collapse; strain, collapse; strain, collapse. It can be very subtle, but it's there.

And of course, as we've seen, the problem of effort is very closely associated with the problem of time. We feel driven to get through what's happening now in order to make something better happen later. So this relationship also has a quality of drivenness to it. And where we find drivenness—tanha—we find the extremes, and we find pain.

So where is the middle way? The middle way can be found where there are no anta, no extremes, no opposites. In other words, where we are not stuck on anything. The middle way is found as a dynamic balance between opposites—the place characterized by no fixed position.

And this balance, this dynamic balance, can only be found in the present. In the absence of any holding to the past or striving for the future. No clinging to, no escaping from. And this absence of any fixed position is dynamic. It's never still—it's always moving.

Hence the eightfold path is characterized by dynamic complexity. You begin with eight factors. All of them are necessary. If one is missing, the whole thing jams up.

If any one of them is too weak, the whole system collapses. If any one of them is too strong, the whole system collapses. The whole system is thrown out of balance and the path does not work.

So balance is everything. And balance requires pleasure because it requires delicacy. When we are driven, we blunder. We're desperate to get away and arrive somewhere else, and we lose our sensitivity to what is happening now.

If we look at the path and its complexity, first of all, as we said, it's one system of eight aspects: right view, right aspiration, right action, right speech, right livelihood, right energy, right mindfulness, and right concentration. Each one of these factors has to be balanced with every other factor.

And these eight factors are divided into three subsystems. There's one system, the eightfold path, that consists of three subsystems: sīla, samādhi, paññā. Each one has its own internal dynamic. So each subsystem has to be balanced within itself, and each one of them has to balance with the other two.

If we look at just one of these, the one we work with most often as meditators—the meditation subsystem—we have right energy, right mindfulness, and right concentration, as we've been talking about. Right energy is the active, doing side of meditation practice. Right concentration is the receptive, peaceful side of meditation. And right mindfulness—its job is to balance both. This is just one subsystem out of the three.

So what we have is a complex network of relationships. I'm not mathematically inclined, so I haven't worked out how many relationships are possible here, but I gather there must be a lot. And all of these relationships are dynamic, because each relationship between any two or more factors is influenced by the behavior of every individual factor and every individual subsystem.

In this complexity, there is no place to take a stand. There is no ground upon which to build a position and then cling to it. Remembering that the Buddha felt what makes this Dhamma hard to understand is that people find pleasure in their positions, are devoted to their positions, delight in their positions.

Taking a stand—"This is it. This is right. Now I've arrived. I've just got to keep doing this. I've just got to extend this experience for the rest of the month."

Now, who does this? Who finds pleasure in their positions, is devoted to their positions, delights in their positions? Well, Gautama did, before his awakening. And his five companions certainly did. And of course, we do.

So the Buddha presents the middle way, and the companions actually understand what he's talking about. They actually get it, which means they can now challenge, if not drop, their deeply held convictions about life, about their world, about their practice, about what they're doing—their positions. And so now they're ready to listen to what he's got to say.

The Buddha has found a way through their defenses, and now he can actually get started. He'll do this by teaching the four truths.

For us, every time we take a position, we lose the middle way. Because we find ourselves in an anta, an extreme—a place which is defined as the opposite of another. Self, for example, is an extreme. And that's something we're going to look at later on.

Thursday we'll have a look at the four truths and continue the Dhamma-cakkappavattana Sutta.

Any questions?

"I don't find pleasure in sticking to some of my opinions."

Why do you stick to them then? You don't find pleasure?

I find frustration in holding to certain positions.

But why do you stick to frustration? If you're sticking to it, there must be a payoff. There's got to be something you're getting from it, otherwise you wouldn't do it. And that's the clinging to the position itself—the satisfaction that comes from maintaining that stance. This is one of the more perverse things about human behavior: we get enormous satisfaction out of our pain. Huge satisfaction.

When I see somebody harming themselves, it sets off a reaction in me. That is the opinion arising. Why are you harming yourself? And so there's a movement of the heart, which is compassion. But it's compassion mixed with holding. How can one have that response without the holding part?

There's one discourse where the Buddha is talking about his job as a teacher. He says, essentially: I teach students, and some of them resist what I'm telling them. They don't get it, they don't understand what I'm talking about, they don't do what I advise, and they don't get the good result. What's that to me? But I have other students who do listen to what I say, who do take my advice, who do the practice, and who do get the result. What's that to me? It's the same response. And that's what enabled him to keep going for all those decades—because it didn't matter whether it worked or didn't work. Fundamentally, it didn't matter. It was his dharma to teach, so he taught. And if it didn't work, well, it didn't work. He just moved on and continued his activity.

This is one aspect of the meaning of dharma. Dharma is duty. Dharma is reality. This is what's going on. Now, given that this is what's going on, what should I do about it? What's my dharma? What should I be doing? What the Buddha is suggesting is that a deeply held sense of satisfaction comes from doing one's dharma—regardless of whether or not people think it's successful. That's got nothing to do with it. Is this my dharma? This is what I do.

Just to give a personal example: in the early years of teaching these retreats, around about the middle of each one-week retreat, I would have something of an anxiety attack. People would be meditating and things would be happening, and I'd suddenly think, "Oh my God, who do I think I am that I should be messing with the minds of these people?"

And it would really quite agitate me until the thought would eventually arise: I'm not in charge of their experience. They are in charge of their experience. My job is to teach the best I can. And that's it. The rest is up to them. And then I would calm down.

I don't know if that's at all helpful.

Thank you very much.

CHAPTER 50

The Mirror of Dharma Part 2

Patrick Kearney · 58 min

In this second talk of the Mirror of Dharma series, Patrick Kearney examines the historical development and practical mechanics of the Mahāsī Sayādaw's pure insight (suddha vipassanā) method. He traces how this approach emerged from a broader Burmese Buddhist reform movement following the Second Anglo-Burmese War of 1852, designed to make awakening accessible to ordinary lay practitioners.

Kearney unpacks the Satipaṭṭhāna Sutta's remarkable promise that practitioners who maintain continuous mindfulness for as little as seven days can expect either full awakening or the state of non-return. He clarifies a crucial misunderstanding about Mahāsī's practice of 'noting' (anupasanā), explaining that it means directly 'aware-ing' experience rather than conceptually labeling it. Drawing on the Yuganaddha Sutta, he situates the Mahāsī method within the Buddha's teaching that insight can precede serenity, offering an alternative to the more commonly known path of establishing deep concentration first.

The talk explores the distinction between direct first-hand experience (paramatthadhamma or 'ultimate reality') and conceptual second-hand experience ('conventional reality'), showing how noting the nāma-rūpa stream—the dyad of awareness and its object—provides the gateway to insight. Kearney emphasizes that what matters is the continuity of awareness rather than the specific object being noted, preparing practitioners for the journey through the sixteen insight knowledges (ñāṇa) that map the path to nibbāna.

So welcome to the second in our series of four talks around the general theme of the mirror of Dharma.

Last week we discussed the concept of the sotāpanna, stream enterer, in Mahasi Sayadaw's system of meditation. You might remember that the original text, the Mirror of Dhamma, was a talk given by Mahasi Sayadaw to, quote, "well-practiced yogis." In other words, people who he thought had attained stream entry. What we call the Mahasi method is explicitly designed to take the practitioner from here to awakening using the pure insight approach. This is suddha vipassanā, or sometimes you see it called dry insight, sukkha vipassanā. I can tell from the response in this room that a lot of people think, "Yeah, dry." The tradition says this approach to practice is dry, and if you need to moisten, to get a bit wet, try doing mettā, because mettā is wet.

Now this method is a product of the twentieth century, developed by Mahasi Sayadaw, who lived from 1904 to 1982. He established his reputation in Burma in 1945 when he published a book called Manual of Insight—probably in Pali it's called Vipassanā Dīpanī—which has recently been translated into English. This laid out his method along with the doctrinal context in which it's embedded.

Mahasi Sayadaw himself was part of a broader movement within Burmese Buddhism that began in the mid-nineteenth century. Specifically, it began after the Second Anglo-Burmese War of 1852. This was one of three wars through which the British Empire conquered and occupied Burma during the nineteenth century. The whole process had pretty much finished by 1888, which marked the end of the so-called pacification campaign in Upper Burma.

After the Anglo-Burmese War, their defeat in the Second Anglo-Burmese War shocked the Burmese. They were already shocked by their defeat in the first war, and it inspired them to begin a program of national revival in order to be ready to face the threat they were under. This national revival included the reform of Buddhism to make it fit for the purpose of preventing Burmese culture from being overwhelmed by that of the British.

A central part of this reform movement was the creation of methods of insight meditation—in Pali, vipassanā bhāvanā, the cultivation of insight, or mindfulness meditation, satipaṭṭhāna. The idea was to revive its practice in such a way that it would enable ordinary lay people to penetrate into the Buddha's Dhamma to the point of realizing awakening. In particular, it was focused on bringing as many people as possible to the vision of Dhamma, the dhammacakkhu, which represents the first stage of awakening.

So Mahasi Sayadaw was part of this broader movement. In 1945 he published his Manual of Insight, and in 1947 he was invited to Rangoon to become the head teacher of a new center. Burma formally attained independence in January 1948, but it was actually granted through an act of parliament in 1947. So in 1947 and 1948, finally, the Burmese had shaken off the British and were embarking on a shaky career as an independent nation.

In 1947, Mahasi Sayadaw was invited to Rangoon to become the head teacher of a new center dedicated to the practice and propagation of insight meditation according to his method. In Burmese, this became known as the Mahasi Thathana Yeiktha, usually in English known as the Mahasi Center. This center became the headquarters of a movement to spread insight meditation throughout Burma and the world.

The aim of this center, like all the others that had been opened in the twentieth century and were flourishing, was to spread insight meditation to ordinary people—lay people, ordained people, men, women, makes no difference—and teach them the way to at least the first stage of awakening: stream entry.

To revise what we talked about last week, the Buddha saw awakening as a process, which is not surprising when you consider he saw pretty much everything as a process. It was marked by four distinct stages—four landmarks in this process. The first one is stream entry, the most junior. The last one, the most senior and therefore the most difficult, is full awakening or arahant.

As we talked about last week, the Buddha sees the human condition as consisting of two aspects: the cognitive and the affective. The cognitive is the area of reason, rationality, understanding and so on. The affective is the realm of feeling, emotion and so on. When he talked about the fundamental human problem, what is it from the Buddha's perspective? If we speak cognitively, it is avijjā or moha.

These are two Pali words which can be translated as ignorance, or they can be translated as delusion. Speaking affectively, what's the fundamental problem? It's *tanha*—literally "thirst," but normally translated as craving, or it could be translated as drivenness.

Now, what is the solution to the fundamental problem that we have? Speaking cognitively, it's *bodhi*: awakening, waking up. And again, you notice this is essentially cognitive. "Enlightenment" is the classic translation. Speaking affectively, it is *nibbana*. This is coolness, and it's literally the going out of the fires of greed, hatred, and ignorance.

When you look at this model and compare it to his model of the process of awakening, it does seem clear that he thought the cognitive aspects of our problem are more easily dealt with than the affective.

So stream entry—what marks stream entry is the vision of Dharma, which cuts through the cognitive problem of wrong view. Notice "vision," "seeing"—this is a hint that it's cognitive. This cuts through wrong view by abandoning what he called *sakkāya-diṭṭhi*, which is essentially the view that the person is real, not just a bundle of concepts and drives that we cling to and believe to be "me." In other words, this is an insight into *anattā*, into not-self. So stream entry cuts through delusion, and it results in the perception of not-self.

But the affective drives of greed and hatred, attraction and aversion—these continue to roll on. And as a result, let's say that someone has actually gone through this whole program, they've attained the first stage of enlightenment. Others may find it difficult to

recognize that anything special has happened to this person. They still get pissed off. But they might not notice that they're not pissed off for as long as they used to be. It's subtle; the change is subtle. Even the stream enterer herself may have doubts.

But from the perspective of the tradition, once the practitioner has glimpsed the vision of Dharma, further progress along the path is inevitable. Such a person will complete the journey. Now, it may take a while—like lifetimes—but this journey will be completed. This is the Buddha's teaching.

Given the centrality of the experience of the vision of Dharma and the attainment of stream entry, and given that doubts may linger about this, it becomes important that practitioners learn to accurately assess their own attainment. Hence the importance of the mirror of Dharma that we talked about last week.

Tonight we're going to focus on the practice that leads toward, or culminates in, stream entry. In other words, we're going to talk about the practice which cuts through delusion. And we'll begin with the Satipaṭṭhāna Sutta, which is the root text of our practice in this lineage.

Now again, *satipaṭṭhāna* is essentially mindfulness meditation. You notice that people will use the expressions "insight meditation" and "mindfulness meditation" synonymously, and there's good reason for doing this. This particular discourse—again, it's the root text of the practice, and it's the text from which the teachers teach—begins with a quite remarkable statement. The Buddha says: "This is a one-way street for purifying beings, transcending sorrow and distress, dissipating pain and grief, attaining the method and realizing nibbana: the four applications of mindfulness."

So this is my translation of this introductory sentence. Notice that the practice of satipaṭṭhāna is a "one-way street." Now that's my translation. Anālayo translates it as "direct way." But they're really both pointing in the same direction. *Ekāyana magga* —"one going way."

And this is a one-way street, a direct way to where exactly? Well, the Buddha goes through a series of attainments and it culminates in nibbana. So, for practical purposes, at the very least: stream entry. Take this path and it will lead us to nibbana. Again, perhaps it will take a while, but if the practitioner matures in her mindfulness practice, she will attain nibbana.

Now this sounds very much like the promise that the stream enterer will attain full awakening. It's got the same measure of complete confidence and total certainty. And the resemblance becomes greater when we think of the belief that the stream enterer will attain awakening within seven existences. Because at the end of the Satipaṭṭhāna

Sutta, we find something very unusual. In fact, I can't think of any other discourse in which I've seen this. We have the Buddha making a prophecy—prophesying the future. And this is what he says.

Whoever practices these four applications of mindfulness like this for seven years can expect one of two results: either perfect insight here and now, or if a touch of clinging remains, the state of non-return. So full awakening, or number three in the process, non-return. Only seven years—this is pretty good.

But then he says, forget about seven years. Whoever practices these four applications of mindfulness like this for six years can expect one of two results: either perfect insight here and now, or if a touch of clinging remains, the state of non-return. Forget about six years. Whoever practices these four applications of mindfulness like this for five years, four years, three years, two years, one year, can expect one of two results: either perfect insight here and now, or if a touch of clinging remains, the state of non-return.

So he keeps bringing the bidding down, down, down. Forget about one year. Whoever practices these four applications of mindfulness like this for seven months, six months, five months, two weeks, can expect one of two results: either perfect insight here and now, or if a touch of clinging remains, the state of non-return. Forget about two weeks. Whoever practices these four applications of mindfulness like this for seven days can expect one of two results: either perfect insight here and now, or if a touch of clinging remains, the state of non-return.

This is why it is said: this is a one-way street for purifying beings, transcending sorrow and distress, vanishing pain and grief, gaining the method, and realizing Nibbana —the four applications of mindfulness.

Now, in all of this, first we have the prophecy, the absolute certainty, and this comes from the very earliest tradition. Second, notice the importance of the number seven. The Buddha begins with seven years, then takes it down. When it reaches one year, he resumes the bidding at seven months and ends up with seven days. But always seven.

Let me just remind the people in this room who are engaged in this practice: seven days. Does that mean continuous awareness for seven days? So if you've got any friends here and they come back unchanged, you can berate them. They can't make the excuse they didn't have enough time.

In an oral tradition—and of course this is all oral tradition—numbers often have symbolic meaning. In the case of seven, it seems to relate to natural cycles. In the Indian tradition, you have the five visible planets along with the sun and the moon, making

up seven. Beyond the Indian tradition, in the book of Genesis, the cycle of creation takes seven days. So the number seven appears in Indian and non-Indian traditions alike, and it seems to indicate a natural cycle. Perhaps what they're suggesting here is that the practice journey of a stream enterer is part of a natural cycle which, when complete, will culminate in awakening.

To get a sense of how long this natural cycle might take, one simile we find in the tradition is that Samsara is like an infinite ocean within which beings are trapped. The vision of Dharma immediately, like that, evaporates that ocean so that only a puddle remains. Of course, if the ocean is infinitely large, there could be a pretty big puddle. In other words, this attainment is highly significant, but it's not the end. Some people would say it's the beginning. One practitioner I know said it's like when you start the practice, you're crawling around on the floor. At stream entry, you can actually stand up. Basically, you're just beginning.

When the tradition talks about the eightfold path, sometimes you have the earlier eightfold path, and then the noble eightfold path. When does the noble eightfold path begin? It begins at stream entry. Before then, it's just the eightfold path. So stream entry is both a culmination of something profoundly significant and a beginning. It's a good beginning, but it's just a beginning.

So you've got this connection between Satipatthana, mindfulness meditation, and the attainment of stream entry—a very close connection. The Mahasi method of meditation represents an attempt to make available in our world the practice method presented in the Satipatthana Sutta.

So what is that method? Let's backtrack to the udesa, the summary or introduction to the Satipatthana Sutta. Here the Buddha gives a kind of executive summary of the practice, and he does it not by giving a definition, but by describing someone undertaking the practice. This is quite common for the Buddha—often, especially when it's practice-related, he won't give a definition.

He'll describe how it's done.

So you have a sentence which appears four times, one time for each of the four satipatthanas. We'll just go through the first one, where the object of meditation is body. And the Buddha says: a practitioner, surrendering longing and sorrow for the world, lives tracking body as body—ardent, clearly understanding, and mindful. This is the executive summary of the practice.

Now let's focus on the phrase "tracking body as body." This expression, "body as body," implies a direct, face-to-face encounter with body, with physical experience, rather than an experience mediated by concepts.

So let's say I'm doing sitting meditation. Let's say I'm in a retreat, doing lots of sitting meditation, and I feel a sudden pain in my left knee. And I know that the left knee is the dodgy one. So what is this experience? It could be a problem. It could be a serious problem. It could be a problem that, if it gets bad, could sabotage my whole practice—certainly my whole sitting meditation, not to mention involving visits to a physiotherapist. This is a serious problem and it could really screw up my retreat. So that's one way, one mode of experience. By the way, does this kind of encounter sound familiar?

Now, you notice that the answer to the question "what is this experience?" is entirely conceptual, and it's concerned with the fate of the self—me. It's not actually about body. It's a cloud of concepts.

Alternatively, we could ask the question "what is this experience?" and one might answer it with: sharp, tingling, numb, aversion, hard. Now these are also concepts, but they're concepts that are grounded in the actual physical sensation. They indicate that the awareness is being aimed at the actual physical sensation and not at the cloud of concepts buzzing about. And this is being aware of body as body—keeping the mind grounded on the particulars of the actual physical event as it presents, rather than getting lost in concepts about the physical event. In other words, it indicates what sometimes we call intimacy, becoming intimate with the experience.

So: "Here a practitioner lives tracking body as body." We have the verb "tracking," and this translates the verb *anupassati*. You get different translations from different people. Bhikkhu Bodhi translates it as "contemplates" or "contemplating," which I don't like because it implies or suggests thinking about. I prefer "tracking."

It's a translation of the Pali verb *anupassati*, which is a compound made up of the prefix *anu* and the verb *passati*. And *passati* is the verb "to see"—*vipassana*, insight, for example. *Anu* denotes "along." So *anupassana* is seeing along, tracking experience over time. And this is the central practice of satipatthana. This is essentially what it's about.

It implies, first of all, directing awareness towards something—in this case body—and so establishing awareness with a direct, face-to-face encounter with the object of experience, whatever it is. And then continuing this direct, face-to-face encounter over a period of time. In other words, establishing a continuity of awareness over time, which is what we've been talking about in this retreat. This is what mindfulness is. We experience mindfulness as the continuity of awareness.

Now, if this reminds you of Mahasi Sayadaw's practice of noting, it's hardly surprising, because that's exactly what it is.

There is some confusion over what Mahasi Sayadaw means by "noting" a meditation object. Does it, for example, mean to name something? Does it mean to write a note about something? And the problem is translation. This is a chronic problem in establishing the Buddha Dharma in the West, because it's astonishing—and it's very distressing, actually—how few meditation students know Sanskrit and Pali. I shake my head.

Much less Burmese. Now, I admit I've never learned Burmese. I didn't have time when I was in Burma—I was too busy noting.

Keep in mind, Mahasi Sayadaw wrote and taught in Burmese. Now the Burmese language, apparently—since this is what I've been told by someone who speaks Burmese—possesses a verb "to aware," as does Pali, as does Sanskrit. And of course Pali is what Mahasi Sayadaw draws upon in order to talk about the practice.

So the Pali word for awareness is viññāṇa, and this is derived directly from the verb vijānāti. In one discourse, when the Buddha is defining certain key terms, he defines them based on the verb. So he says, "When you say awareness, one awares, therefore one says awareness." Now, in English, this sounds rather odd—like, what? But in Pali, it's: Why do you say viññāṇa? Vijānāti, therefore viññāṇa. And you can see the connection. Similarly with perception, saññā. Why do you say perception? One perceives, therefore one says perception. Why do you say saññā? Sañjānāti, therefore saññā. So there is this very close relationship between noun and verb in Indian languages.

Now, in English, by and large, we do not use the verb "to aware." We generally just use the noun "awareness." But there is a verb "to aware" in Burmese. And when Mahasi Sayadaw's translators—these were lay supporters, volunteers, not professional linguists by any stretch of the imagination—when they came to translate this, they were faced with the problem of the absence of the same verb in English. Mahasi Sayadaw is using an ordinary Burmese verb, but as far as they could see, it doesn't exist in English. What to do? So they used the verb "to note," not realizing the confusion that they were creating.

So when Mahasi Sayadaw says we must note something—body and mind—what he's saying is we must directly aware it without adding any layers of concepts on top of it. In other words, using the Buddha's language, we aware body as body, mind as mind.

Now this understanding of the meaning of noting, I get the distinct feeling, is not widespread in the lineage. So let's briefly look at the words of Mahasi Sayadaw. I'm calling on his authority to back me up.

Let's begin with his Manual of Insight, the central text of our lineage. Mahasi says, "True insight practice is an awareness of all the mental and physical phenomena that constantly arise at the six sense doors." You'll notice he backs away from using awareness as a verb. But in this context, awareness is clearly used to refer to what normally we would call noting. It is interesting, though, that it's presented as a noun rather than as an activity.

Elsewhere in the Manual of Insight, Mahasi says, "The terms 'to note,' 'to observe,' and 'to bear in mind' are synonyms for the purpose of insight practice." So to note, to observe—they're the same thing. To bear in mind. Now this is interesting because "bearing in mind" is an expression often used to explain mindfulness. To bear in mind, to carry in the mind, to be aware over a period of time.

Mahasi Sayadaw also tells us that his way of practice is called pure insight or dry insight—suddha vipassanā, sukkha vipassanā. And in his book The Progress of Insight, he says, "The approach followed is that of quite bare insight"—or what in the English translation is "bare insight" is also "dry insight." But let's say bare insight, "where by direct observation, one's own bodily and mental processes are seen with increasing clarity as being impermanent, liable to suffering, and without a self or soul."

So observation, seeing, awareness—all these terms indicate that when Mahasi is talking about noting, he's not talking about putting names on things and writing little notes about them. He does not mean building a concept on top of what is observed. Now, writing notes can in fact be useful. This is what in this retreat we've been calling naming. But it's an optional added extra. It's not noting.

Directly aware of experience, and doing this consistently over a period of time—this is the essence of his approach. And it's designed to take us directly to insight.

Now, just to add that this approach remains controversial in the world of Theravada Buddhism. First of all, it's modern, invented in the twentieth century, along with other methods in Burma. Secondly—I don't know if I should really say this because I'm being recorded—I'll say it anyway. It's Burmese. Now, if you're a Thai Buddhist, you have to think, "Who the hell are the Burmese to teach us how to meditate?" And if you're Sinhalese in Sri Lanka, you might well be tempted to think, "Who the hell are you, the Burmese, to teach us how to meditate?" And in fact, there was a lot of controversy in the fifties, the sixties, and beyond. You find that some meditation lineages based in Thailand and Sri Lanka explicitly reject the Burmese way. So a certain amount of nationalism is involved in this controversy.

But the main controversy, the main problem, is that this approach of pure insight, dry insight, bare insight—it bypasses the better-known route of first establishing deep concentration or serenity, *samatha*, and then cultivating insight. This approach is repeated again and again in the discourses. It's part of the template of the practice called the gradual training, which tracks a linear progression of the student from the beginning, all the way to full awakening. And it involves first doing deep serenity practice, and then doing insight.

However, the early teachings are quite diverse when you actually get into them. Just to give an example, we can find mention of different approaches to meditation practice in a discourse called the *Yuganaddha Sutta*—"Intermeshed." This discourse was presented after the Buddha's death. We know this because the person speaking is the Venerable Ananda, who only became a teacher in his own right and only became fully awakened after the Buddha died. Because basically, when the Buddha was alive, Ananda was too busy looking after him and managing the traffic. He was, in a sense, the guard dog between the Buddha and the public.

If you go to Rajgir in northern India, this is where you find the ruins of the city of Rajagaha. Outside the ruins is a hill called Vulture's Peak, very famous in Mahayana Buddhism. If you follow a track up towards the top, you come to two rectangles of solid brick or stone—one right beside the track and the other further away. According to tradition, these are what remains of huts built for Ananda and the Buddha. Ananda lived right at the front. So if anybody wanted up the hill to see the Buddha, they literally had to go past him to get there. The Buddha was in the rear. This was very much part of Ananda's job. He was too busy to do a lot of meditation.

It was only after the Buddha died that he could devote himself to his practice, and eventually he became fully awakened and a major teacher in his own right. In the Zen and Chan tradition, he's seen as the third ancestor.

Now, here Ananda is talking about how different students of his, when they come to report full awakening and he asks them, "So how did you get there? What were you doing?"—they expressed one of four ways of practicing. We're going to drop the fourth because it's a bit strange. We'll just stick to the first three.

These are the three ways. Ananda says: Number one, a practitioner develops serenity preceding insight. First develop deep concentration, then develop insight. As he develops serenity preceding insight, the path is created. Number two, the practitioner develops insight preceding serenity. First you develop insight, then you develop the

deep concentration. As she develops insight preceding serenity, the path is created. Or, a practitioner develops serenity and insight intermeshed. As you develop serenity and insight intermeshed, the path is created. And so on.

In other words, every way to awakening involves both serenity and insight, and they're working together in some way—but not necessarily always in the same way.

One of the images used is this: imagine you have an ox cart pulled by two oxen. Now, ox carts were incredibly important in the Buddha's time, a major form of land transportation for goods. Let's assume you've got two oxen and you've loaded up the cart and you want the oxen to take the cart to its destination. Now let's say that one of these oxen is particularly strong, and maybe a bit feisty. Well, you put that ox in at the front, and the other ox behind. The strong one leads the way. But let's say they're pretty evenly matched.

If the two oxen happen to get on quite well with each other, you simply put them side by side, and away they go. In other words, serenity and insight are qualities absolutely essential for the practice, regardless of what method one uses, but the relationship between them can vary from person to person.

Mahasi Sayadaw appears to have regarded his approach as an example of insight preceding serenity. Certainly, at the Mahasi Center, students who "graduate" by attaining the first stage through pure insight—or dry insight—are then offered instruction in serenity practice by their teachers. So insight first, serenity second. This seems to be Mahasi's approach.

Now, when one is actually doing this practice, we come back again to the difference between directly experiencing something and experiencing concepts about that something. This is really central for the Buddha and for the later tradition. The basis for this, the underlying concept, is the idea of *dharmas*—or in Pali, *dhammas*—always in the plural. Often you see the word *dharma* in the singular, where it has various possible meanings, but sometimes you see it in the plural, *dharmas*, and there it has quite a distinct meaning.

If we ask what is real—what is really out there, what is really in here—for the Buddha, what is really happening is a flow of dharmas. And what is a dharma? It is a directly encountered event.

Mahasi's explanation of this is that reality, whatever we mean by that word, comes to us in two forms. First, there is what we directly experience firsthand through the senses—and this includes mind, because for the Buddha, mind is a sense. Second, there is what comes to us indirectly, secondhand, through concepts about what we directly

experience. So we have firsthand experience, what directly impacts the senses, and secondhand experience, which is made up of concepts about what is directly impacting the senses.

Firsthand, direct experience is always associated with understanding and insight. Secondhand experience, made up of concepts, is associated with delusion and the suffering that comes from delusion. The aim of the practice, then, is to move from secondhand experience to firsthand experience. In a sense, that is the job—that is the boot camp.

In the Theravada tradition—this is not the Buddha himself but later Theravada—direct firsthand experience is called ultimate reality, while secondhand experience, concepts about what we directly experience, is called conventional reality.

So if we are practicing noting, what are we doing? We are training ourselves to ground our perception in what the Theravada calls ultimate reality—in other words, the world of directly experienced events. This is the world of dharmas. And this is the world where insight arises.

Normally, our habit is to live in the world of conventional reality, a world of concepts about what we are directly encountering. For the Buddha, this world is a product of our habitual conditioning from a very deep past. This conditioning has been shaping us since our birth—and in fact, for the Buddha, far longer than that. When we ask what forces accomplish this conditioning, they are the three *akusala mūla*, the three roots of the unwholesome: greed, hatred, and ignorance. This tells us that the world presented to us through our concepts is not just wrong, but actually entangles us in pain and misery.

The job of the practice is to move us out of this secondhand conceptual world into a world of ultimate reality, direct firsthand experience, because it is in this world where insight arises. And the practice of noting gives us entry into this world.

One way Mahasi Sayadaw speaks about the practice is to describe it as noting the *nāma-rūpa* stream. This comes out of our original text, *The Mirror of Dharma*. To understand what he means, we must examine this technical term, *nāma-rūpa*.

Essentially, what this is saying is that awareness is always accompanied by an object. If I am aware, I am aware of something. If I am seeing, I am seeing something. If I am hearing, I am hearing something. If I am thinking, I am thinking something. Awareness is structured as a dyad of awareness and its object. They always arise together in this dyad.

Now again, awareness—let's use the verb, "awareing." If there is awareing, it's tied to an object. There's something that is aware. So if something is happening, and this is the object of awareness, if something is happening, there must be awareness of it. Otherwise, it wouldn't be happening. And if there's awareness, then something must be happening. You can't separate them. You can't have one without the other. If you've got one, you've got both. They always arise and cease tied together. And the Buddha speaks of this as the dyad of nama-rupa. What exactly these words mean, we may or may not explore next week. But that's enough for this week.

Now, remembering that both the Buddha and Mahasi Sayadaw speak of awareness as a verb, as an activity—when we are aware, usually, habitually, we assume that what is important is the object of awareness. So when I am seeing, I assume that what I am seeing is important. When I'm thinking, I assume that what I am thinking is important. I don't normally pay any attention to the activity of seeing, the activity of thinking. But it's here, in the activity, that we find awareness. Not there, in the object.

And in the technical language that both the Buddha and Mahasi Sayadaw use, awareing is nama. The object of awareness is rupa. And so you have the compound nama-rupa. If you've got one, you've got the other. They come together.

So nama-rupa indicates the stream of direct, first-hand experience—events coming and going into and out of awareness. Not the web of concepts that surround our direct, first-hand experience. Unless, of course, we note the web of concepts, in which case the web of concepts becomes direct first-hand experience.

So here is how Mahasi Sayadaw describes the practice: "For the practicing yogi, he has to be noting the ever-arising nama-rupa phenomena and continuously noting such phenomena as rising-falling of the abdomen, sitting, touching, seeing, hearing, bending, stretching. Not just four, five or ten notings, not even a hundred, nor a thousand. It has to be continuous and in close succession."

What Mahasi is emphasizing is the continuity of the awareness—or rather, the continuity of awareing, of the activity. Now, you notice that he's not particularly concerned with the object of awareness. It could be breathing, it could be posture, it could be sitting, it could be moving, whatever. Although we can see that he's staying within the broad territory of the grounding object, or the primary object, because all these examples are body, the five physical senses. And body usually provides our grounding object, because for most people, body as an object of awareness is clear and available.

But you notice, first of all, continuity of awareness. And secondly, it doesn't really matter what the object is, so long as it's clear. That really helps. And you notice how he says that the meditation object consists of nama-rupa phenomena. So what are these phenomena? They are dharmas. They are the events we experience directly, first-hand, through the senses. They are not concepts about what we are directly encountering. In other words, they're not what comes to us indirectly, secondhand. They're not about. They're the actual direct encounter with the senses, cutting through the concept. And this is the key to the practice. And this is the gateway into insight for Mahasi Sayadaw.

Now, once through this gateway, the world of insight emerges. And it emerges as the three universal characteristics: anicca, dukkha, anatta—change, pain, not-self. And Mahasi Sayadaw maps our journey into these three characteristics.

using a conceptual framework developed by the later Orthodox Theravada of sixteen ñāṇas. A ñāṇa is often translated as insight knowledge or simply understanding. It's a very simple term—the root *ñā*, to know, to understand, with the suffix *ṇa* added, which turns it into an action noun. So: knowing, understanding. In the Orthodox Theravada there's a system of sixteen of these understandings which map the journey of insight from here to Nibbāna. And next Wednesday, if all goes according to plan, we will explore this world as mapped by the Buddha and by Mahasi Sayadaw.

Any questions?

"You may not wish to answer this question, Patrick. It's just my voracious curiosity driving the question. What was the fourth somewhat weird method?"

The practitioner is seized by Dharma agitation. And once this agitation dies down, then the path is established. It's a very mysterious one. Basically, not practicing, but seized by something. What it could be, who knows? Some people, if you heard the story of Bahiya, would say, oh, that's Bahiya's method. But we don't really know. It's an interesting one.

"You were talking about the revival of cultural Buddhism in Burma and how it was remodeled in the twentieth century. I'm curious, there was this revival going on there—what was it that made it jump to the West? What was happening in the West?"

The question is enormous and would keep us here all night. There was this revival of Dharma and meditation practice in Burma, so what was it in the West that connected with this so that it spreads throughout the world? Very good question. Very big question. Don't know.

What is clear is that the Burmese themselves, even in the nineteenth century, had this sense that insight is universal and would be of benefit to non-Burmese. So from the very beginning they planned to export it. And it took a while. The attitudes of cultural superiority in the West in the mid-twentieth century were too great for very many people to actually encounter this approach. I think it was basically hippiedom in the 1960s and 70s. Peace Corps helped too. But culturally it was the explosion of hippiedom and people prepared to explore alternatives. People began to turn up at these different countries' meditation centers seeking out meditation teachers, and it particularly took off in the sixties and seventies.

"And maybe because the Burmese had this notion that it would be helpful beyond Burma, maybe they were more receptive to teaching Westerners?"

Yes, they were receptive to teaching Westerners, which, when you get there—when you got there—is very strange, because the Burmese do not adapt easily to other cultures. And Burmese culture, particularly back then in the seventies and eighties, was largely shut off from the world, quite authoritarian. You step into the monasteries, it's like you stepped into medieval times. Yet they had this commitment, this absolute commitment, that whoever walked through the gates, they would teach. And they asked no questions. They didn't care if you were atheist, Muslim, Christian, whatever.

There was one very senior Catholic monk who turned up when I was there, and they were really interested in him. But they didn't care. They just taught him. In fact, they gave him a lot of encouragement. And they sent off their graduates into the world not knowing what they were going to do with it. Absolutely no idea what these people—who they never really understood, frankly—

what they would do with this. But they just spread it out because they had this complete faith: if we just get it out there, it's going to be good for humanity. And so they did it.

Question from the audience: Why is it that Mahasi says this approach will be quicker than the other?

Because generally it is—well, in terms of getting to the first stage. Once the whole thing settled down, basically if you went to Mahasi Center or one of the other centers to do a retreat, you were expected to sign off for two or three months to do the practice. So one month, you're just warming up, really. If you worked relentlessly hard for two or three months, a reasonable proportion of practitioners—particularly Burmese—would get through. Some people would take longer, but that's okay. They can leave, they can come back.

Whereas if you're talking about mastering the jhānas first, for most people that takes a fair bit of time. But some people get through them reasonably quickly. So a lot depends on the person. For some people this approach is quite good—it suits the way their mind works. But for other people it doesn't suit them at all, and they're better off heading into the serenity world. Any kind of meditation technique is appropriate for certain kinds of people, but not for others. And if you're a meditator looking around, your job is to find the approach that suits the way your mind operates.

In my case, I spent years wandering around the Dharma world, and I wandered into Mahasi Center in 1984. I think within 24 hours I knew: this is it. This suits me. So I've been there ever since. But for other people, it doesn't really suit them. It just depends on the person.

Question: How did Japan, Korea, China, and Tibet get left out of this?

They're not left out. We're just talking about this lineage. To talk about all of them—I mean, you'd spend the month discoursing on the history of modern Buddhism. So we just focused on this particular lineage.

Follow-up question about distance and timing—whether it was too late for places like Japan when the Burmese teachers went out to teach.

No, Zen was going through its own revolution that began with the Meiji Restoration in the late 19th century, again adapting to modernity. The Chinese had problems because they were busy being thrashed by Western imperialism. The Tibetans stayed behind their borders until they fled after the Chinese invasion. So each lineage has its own particular history.

What they have in common is the collision with modernity. And this collision pretty much everywhere came in the form of incredible suffering and disruption, courtesy of imperialism of one form or another. It was when that collision occurred that things started to spread out. But until then, people were happy to stay within their own walls. For the Burmese, it was national emergency that got them started—but it just happened in the mid-19th century, so it gave them time to develop something. By the time the hippies turned up, they'd been working on it for a while.

CHAPTER 51

Origins: The Four Truths

Patrick Kearney · 45 min

> *In this talk from the 28-day Satipaṭṭhāna retreat, Patrick Kearney continues his exploration of the Buddha's earliest teachings by examining the four truths (ariya saccāni) as presented in the Dhammacakkappavattana Sutta (SN 56.11). He clarifies that these are "truths of the noble ones" - perspectives that make sense specifically to those on the path of awakening, not necessarily to everyone.*
>
> *Kearney provides a detailed analysis of dukkha as a compound meaning "painful emptiness," exploring its three aspects: ordinary suffering (dukkha dukkha), the suffering inherent in change (vipariṇāma dukkha), and the suffering involved in constructing a self (saṅkhāra dukkha). He examines taṇhā (craving) as the cause of dukkha, distinguishing it from ordinary desire by its characteristics of leading to further becoming, being bound up with obsession (rāga) and delight (nandī), and restlessly seeking satisfaction "now here, now there."*
>
> *The talk offers practical guidance on letting go, suggesting intimacy with drivenness rather than fighting it, developing equanimity (upekkhā) as "intimate witnessing," and not feeding the fire of craving. Kearney connects ethics to meditation practice itself, showing how each choice to drop distraction is an ethical decision to step outside self-enclosure. The discourse concludes with Koṇḍañña's awakening and the Buddha's joyful response - marking the moment when the wheel of Dhamma began to roll.*

So now we're continuing with our series on the origins of the teachings, going through the first three formal discourses and the surrounding context.

We've followed Gautama in his search for awakening. He became Buddha, and we saw the internal struggle that he had over whether or not to teach. The problem from his perspective was that he didn't know how he could communicate this to others. Finally he decides he'll zero in on his five former companions. When he arrives, after some initial resistance, he persuades them to listen. And he teaches the Dhammacakkha Pavattana Sutta, setting in motion the wheel of the Dharma. He opens this with the middle way.

Now, the middle way is the Buddha's strategy to dissolve the resistance of his audience, to persuade them to actually take him seriously and listen to him. And they do. So now he moves on to the four truths. Let's go through those.

This is the noble one's truth of dukkha. Birth is dukkha, aging is dukkha, sickness is dukkha, death is dukkha. Sorrow, lamentation, pain, grief and despair are dukkha. Association with the unloved is dukkha. Separation from the loved is dukkha. Not getting what one wants is dukkha. In brief, the five aggregates associated with appropriation are dukkha.

This is the noble one's truth of the arising of dukkha. It is craving which leads to further becoming, is bound up with obsession and delight, and finds its delight now here, now there—specifically craving for sense pleasures, craving for existence, and craving for non-existence.

This is the noble one's truth of the cessation of dukkha. It is the complete cessation of this very craving, abandoning it, renouncing it, releasing it, letting it go.

This is the noble one's truth of the way leading to the cessation of dukkha: the noble eightfold path of right view, right aspiration, right speech, right action, right livelihood, right energy, right mindfulness and right concentration.

So these are the four truths. What they give us is the basic framework of the Buddha's teaching.

In Pali, these are the ariya saccāni, and this is a compound. Saccāni are truths. Ariya means noble or cultivated. They're usually translated as the noble truths, but it probably means the truths of the noble ones, or the cultivated ones—the Buddha and other awakened ones. At this point, there's only one ariya, and that's the Buddha. So here I translate it as the truths of the noble one.

What the truths do is show us the world from the perspective of someone who has awakened, or at least who is on the path to awakening. Broadly speaking, these are what is true for practitioners, but not necessarily true for others. And of course, we must remember that we're not speaking of a simple dichotomy of full awakening versus not awakened at all. There are levels or depths of awakening, and there are levels or depths of delusion. In general terms, a noble one, or a cultivated one, is someone who has attained to any degree of awakening, but more generally, a mature practitioner on the path—even someone on the way to this awakening. But the key point is that these are truths for some people, but for a lot of people, they're not. They don't make any sense at all.

The truths are dukkha, its arising, its cessation, and the path leading to its cessation. As you can see, they all revolve around this key concept, dukkha. So let's have a look at it.

It's a compound word, derived from the word kha, meaning empty space, and the prefix du, conveying the idea of bad, unpleasant, painful, undesirable, and so on. So dukkha is a painful emptiness. It refers to the painful emptiness that we find at the center of our being. We can recognize this because we have this sense that something necessary for our well-being is missing in our lives, and we have to do something to fill that gap.

Kha also refers to the hub of a wheel. So dukkha is a badly fitting axle that results, if it's fitted to a vehicle, in the vehicle either not being able to move at all, or if it does move, it's only with difficulty and with grind. Dukkha represents a sense of grind and slog in our everyday experience, like pushing a cart uphill. Do you have the sense that this meditation practice is rather like pushing a cart uphill? If so, you've experienced dukkha.

Dukkha is classically translated as suffering, but this is quite inaccurate. Dukkha is a term for which there is no English equivalent.

The English word simply doesn't exist, because dukkha extends from the most gross form of suffering right through to the most subtle form of discontent. Even the slightest discontent is dukkha. The term covers the whole range.

So, why does the teaching begin with dukkha? Some people feel that the Buddha is an old misery bags because he starts off by banging on about dukkha. And perhaps he began with dukkha because the experience of dukkha was his starting point, his motivation. Because if we take action, if we do something, action comes from affect, from a movement of the heart. And here, for the Buddha, it was the pain of dukkha that got him started. So maybe that was why he begins with dukkha, because everybody begins with dukkha. It's the starting point of everyone.

He talks about dukkha in three aspects, and in these three aspects he's going deeper into it. The first one is what came in the tradition to be called dukkha dukkha—the dukkha inherent in pain. This is normal, everyday suffering, represented in this discourse by birth, aging, sickness, and death, accompanied by sorrow, lamentation, pain, grief, and despair. This is just the normal everyday suffering that every human being goes through.

At a deeper level, we find viparinama dukkha—the dukkha inherent in change. This is the pain that arises when experience is recognized as inherently unreliable and out of control. It's represented by "association with the unloved, separation from the loved, not getting what one wants."

Has anybody here ever been separated from what they love? Has that ever happened? What about not getting what you want—once or twice? What this is pointing to is that our circumstances are constantly changing, and we are not in charge of these changes. This is the key point. And of course this becomes more evident the deeper we go into the practice—the more obvious it is that if anybody's in charge of this process, it's certainly not me, the practitioner.

Things change. And they change not because we want them to change, but because they are the result of a network of conditions infinitely more complex than ourselves, and therefore impossible for us to control—usually impossible for us to even understand. This network of conditions has no firm, stable foundation. There is nothing upon which we can stand and say, "Here I am. I can hold on to this." So we keep groping around, looking for this foundation, but we come up with nothing. And this sense of absence at the core of existence—this is dukkha.

Finally we get sankhara dukkha. This is differently translated, but here it's translated as constructing dukkha, where the Buddha says, "In brief, the five aggregates associated with appropriation are dukkha."

We're going to look more closely at this later when we talk about anatta. The five aggregates is one of the two basic schemas the Buddha uses to analyze the human condition—the other one is the six senses. Basically, they are those aspects of our experience that we appropriate to construct an identity that we can see as permanent and hopefully satisfactory. This is the self that the Buddha talks about.

For the Buddha, self—roughly speaking, who we deeply think and feel we are—never presents as a direct, first-hand, unmediated experience. We can never note self. We take it to be real, but we can never quite bring it into awareness. And we take self to be not just real, but the center of our world. We assume that this world I'm in is all about me, and it centers on me. I am, quite literally, the center of my world. If I look around, go 360 degrees, there it is.

It's around me.

So let's say you're attending a meditation retreat and you're deeply into it. What is this retreat for? What is it about? Isn't it for me? Isn't it about me? Isn't it my retreat?

This taking as mine is upadana. Upadana is normally translated as clinging, but it's literally possession, a taking to be mine. And where there's upadana, appropriation, there's a self.

Now, from the Buddhist perspective, a self is painful because its demands can never be satisfied. So, for example, this retreat, which is all about me—what would it take for this retreat to be fully satisfactory to me? Well, I can think of a few things: developing samadhi in every sit, unbroken mindfulness throughout the day, pleasant meditation experience followed by pleasant meditation experience, fellow practitioners who never do anything to annoy me—and the list goes on.

And of course, when we think about it, it's perfectly obvious that this is a fantasy world. It's not real. And the Buddha is saying that any attempt to construct a satisfactory self ends in failure. We see this in the fact that the construction of the self never stops. We never quite arrive. But we're always scrambling to arrive.

We're going to go more into this when we get to talking about not-self. You notice that the Buddha doesn't explicitly mention not-self here. But the framework of the truths kind of assumes not-self. It's there in the background, but not mentioned.

So this is the first truth, dukkha. And then: "This is the Noble One's truth of the arising of dukkha. It is craving, which leads to further becoming, is bound up with obsession and delight, and finds its delight now here, now there. Specifically, craving for sense pleasures, craving for existence, and craving for non-existence."

So what causes dukkha? Tanha—literally thirst, as we've spoken about before. The unquenchable thirst to possess and to become. We have to fill this emptiness that we feel at our core. And we're driven by this to construct a self, someone who's in charge.

Now the Buddha describes tanha, craving, as desire that has certain characteristics. Often people assume that the Buddha is talking about all desire—that desire causes dukkha. He isn't. He's talking about tanha. This is a specific kind of desire. And he explains; he says it has certain characteristics: it leads to further becoming, and it's bound up with obsession and delight.

So let's look at these. It leads to further becoming. And again, this is linked with self and not-self. We deeply desire to become someone—someone real and satisfactory to ourselves and to others. So we create images of ourselves to ourselves, and we try to believe these images. And we project images of ourselves to the world, and we try to act as if we really are the person that we're representing.

But this job of creating ourselves never ends. It has to be constantly renewed. And we never seem to be satisfied with who we are, with the result. So the drama never ends. And of course this is one reason why getting lost in thinking in the meditation practice

is so catastrophic—because we're lost in that world of endlessly patching up a self that maybe, just maybe, will finally work.

So craving leads to further becoming, bound up with obsession and delight. "Obsession" translates *raga*, which you sometimes see rendered as "lust"—I think that's a fairly common translation. *Raga* literally means "colour." So it's the colouring of the heart when it's trapped in desire and drivenness. And *raga* implies the inability to see beyond something and so let it go. If I'm completely obsessed by something—I must have this, I must get rid of that—I'm so absorbed in it that I cannot see beyond it to the consequences. What will happen if I get this? What would happen if I get rid of that? Would I really be better off?

So this is obsession. And then there is delight—*nandi*. In this case, again, it has a specialised sense: the gratification that comes from satisfying desire. Without *nandi*, we wouldn't bother, because there wouldn't be any payoff. But this gratification sets up another round of desire. That was nice—I think I'll do it again. And then satisfying that desire sets up the next one, and the next one, and the next one. And so it never ends.

Just a couple of examples. In the wider world, consider consumerism and the fetish of the commodity. As a society, it's perfectly clear that we never have enough. If we ever did have enough, the economy would collapse, and the results would be catastrophic. It is our duty to be greedy, because then we're productive and the economy keeps growing. This system works because it appeals to the unquenchable thirst at the centre of each one of us.

So this is the nature of craving and the cause of our suffering.

Another example, perhaps more subtle: have you ever been obsessed by thoughts that you can't let go? Can we stop thinking when we want to? Our relationship to the stories we're constantly telling ourselves, and the satisfaction we gain from them, show us obsession and delight in action.

And then we get the third characteristic of this particular kind of desire: craving "finding delight now here, now there." This conveys the restlessness implied in the endless search for a satisfaction and a completion that never quite arrives. We attempt to satisfy our desires, and sometimes we succeed. But this success sets us up for another desire, or for the repetition of the same desire. This process is endless, and it leads to the wandering on—which is *samsara*. In our practice, we can see this in the thoughts we endlessly repeat, moving from one story to another, to another, to another. Finding delight now here, now there.

And then the Buddha gets down to specifics. He says: craving for sense pleasures, craving for existence, and craving for non-existence. Now, the first one makes perfect sense—craving for sense pleasures. But notice that out of the three categories of craving, two of them are all about identity: the craving for existence and non-existence, the desire to be someone, the desire to not be someone. For the Buddha, these are the deepest forms of desire, and often the kind of desire that drives our obsessive thoughts and emotions.

So that's the arising of *dukkha*.

The Noble One's truth of the cessation of *dukkha*: it is the complete cessation of that very craving—abandoning it, renouncing it, releasing it, letting it go. This varies from subtle to gross. Craving for

Non-existence: I'm in the dining hall getting food, and I'm acutely aware that everybody can see me. It's perfectly obvious that they're all glaring at me and judging my hopeless practice. And so I just don't want to exist. I want to disappear. So I bolt outside where no one can see me. *Don't look at me. Don't look at me. Don't look at me.* That would be a kind of mild form of the craving for non-existence.

The opposite would be *Look at me, look at me, look at me, look at me.* And often we find ourselves swinging between these two.

But of course you have depth, layer upon layer. The craving for existence at a deeper layer would be the clinging onto life regardless—desperately holding on. And the craving for non-existence would be wanting death, wanting obliteration. Drug addicts and alcoholics are often motivated by the craving for non-existence. *Get me out of here. Just for a while, just get me out of here.* That would be craving for non-existence.

I'm wondering also about people—not necessarily Buddhists, but sometimes on the spiritual path—craving to not be here, to not have a body, for example. In Theravada Buddhism, the ultimate ideal is Parinibbana, and this is often interpreted as annihilation, like ceasing to be. And people who actually genuinely feel, "God, it'd be good to get out of here," can be attracted to Theravada. In the Mahayana, the ideal is the bodhisattva, who endlessly cycles through samsara to save all beings. And people who want to keep existing forever and ever find that an attractive idea, so they become drawn to Mahayana. So it permeates everything. And it can be very subtle. And frankly, if we're not enlightened, we've got it. It's one of the things pushing us along.

So, the cessation of dukkha. This is the Noble One's truth of the cessation of dukkha: it is the complete cessation of that very craving, abandoning it, renouncing it, releasing it, letting it go.

Now the Buddha compares the cessation of dukkha to the ending of hunger. If you think about hunger, we are hungry, so we are driven to eat. And this satisfies us for a while. But then we're hungry again, so we're driven to eat again. And this satisfies us for a while. And then we're hungry again, and so on and so on. The cycle goes on. So the Buddha says, well, think about the satisfaction that would come when hunger itself ceases.

To get a sense of what the Buddha might be talking about—although I say this as a non-smoker—compare the desire to smoke another cigarette with the desire to give up smoking. When I satisfy my desire to smoke another cigarette, this sets me up for another cigarette, which sets me up for another one, another one, another one, and so on. But when I satisfy my desire to give up smoking, the desire itself is dissolved. And what's left is peace, a relative absence of disturbance.

In a mundane sense, what the Buddha is talking about here is contentment. For the Buddha, contentment is actually more important than happiness. Because happiness tends to be very transient and highly dependent on certain circumstances. But contentment is much more stable and can flow on through changing circumstances.

So the Buddha says the third truth is the cessation of dukkha through letting go. And letting go, of course, is a very popular—if not clichéd—Buddhist term.

And it raises the obvious question: how do we let go of our drivenness?

This idea of letting go reminds me of relaxation. We can't do it, because any doing is not relaxation. So we begin with drivenness and the tension and stress associated with drivenness. We are driven to do something, to fix this problem, to chase this obsession. We may even be driven to try to let go. So we demand of ourselves: relax now, let go now. And it doesn't work—because basically, the letting go is something we've just added to our agenda. But letting go, in common with relaxation, these are not activities we add to our agenda. They are the cessation of the agenda.

So what can we do? Well, a few suggestions in the practice.

First: be intimate with the drivenness. When you find yourself caught up in it, surrender. Surrender into the drivenness. Feel it intimately. Now, this involves not getting lost in the story, the story about. When we become a character in our tragic story, we alienate ourselves from the intimate touch of the drivenness. It's like the drivenness is behind us, pushing us forward, and our attention is to the front—to what we're obsessing about, what we think is our problem, and what we think will solve our problem. But what we need to do is fall back into the drivenness and surrender into it. So intimacy, which of course is affective.

And secondly: be watchful. This brings us to what the Buddha calls equanimity, *upekkhā*, which he associates with the maturity of mindfulness. *Upekkhā* is a very important quality for the Buddha. The word itself is derived from the Sanskrit root *ikṣ*, to see, and the prefix *upa*, which denotes nearness, close touch, intimacy again. So equanimity involves seeing, witnessing, but intimately. I translate it as intimate witnessing. There is witnessing, and so some degree of detachment. But the witnessing is intimate—from very, very close by. Equanimity represents the unity or integration of the cognitive and the affective: wisdom and feeling. It allows us to experience a storm while maintaining balance throughout it.

So be intimate, be watchful. And finally: don't throw logs onto the fire. The storm rages, but it blows itself out. The fire burns, but it burns itself out. When we surrender and when we intimately witness, we allow the storm to blow itself out. We allow the fire to burn itself out.

Now, the going out of the fire—this is a very famous image the Buddha uses to represent Nibbāna. Because Nibbāna means the going out of the fire. And the point about this image: it doesn't mean we put the fire out. When I first read about this image, I imagined the meditation practice like your local fire station. There comes surging up sirens, raging, a huge hose—blast that fire with water and put it out. But that's not what it's getting at. It's not putting it out; it's allowing things to come to their own natural end.

So it's not that we're doing something to get rid of the drivenness, the fire. Rather, we are allowing the drivenness to fade by not doing anything to feed it. We don't put the fire out—we stop throwing logs on it. And if we stop adding fuel, it will go out. It's just built in.

So we're allowing drivenness to fade by not doing anything to feed it, and then we allow nature to return to its natural balance. And of course we feed the fire every time we identify with it—this is me, this is mine. Every time we drop that identification, in that moment we're not throwing another log on the fire. And it will go out. So this is the third truth: cessation.

Then we get the fourth truth, the path. This is the Noble One's truth of the way leading to the cessation of dukkha—the eightfold path of right view, right aspiration, right speech, right action, right livelihood, right energy, right mindfulness, and right concentration.

We've already talked about the path as indicating a state of dynamic balance. Here let's talk about another couple of aspects. First, this image of path implies that someone else has been here before. We are not the first to do this. In fact, this particular path has been walked for over two millennia, and we are just the latest group of travellers. Others will follow us.

In other words, meditation practice, Dharma practice, is a community activity. We do it together. We owe a debt to previous generations because they're the ones who ensured that the path was available for us when we turned up. And we have a responsibility to future generations—will the path be available to the next generations? This is one of the reasons why we have that little bit of ceremonial at night when we chant in Pāli, why we follow the traditions of Theravāda Buddhism. We're reminding ourselves that we are part of a community that extends from the present into the distant past, and from the present into the deep future.

Secondly, the path involves more than just meditation—it involves a lot more than just meditation. In particular, it involves ethics. In one discourse, the Buddha was asked by a non-Buddhist what he taught, and the Buddha said, "I teach two things: ethics and understanding." It's interesting that he didn't even mention meditation. Ethics involves the choices that we make, and therefore the kind of life that we lead, while understanding is our depth of appreciation of what's really going on. The Buddha said that each one is like a hand that washes the other. You can't clean one hand; you need both. This is the relationship between ethics and understanding—like two hands washing each other, or two feet washing each other. The Buddha was barefoot, so the washing of feet would have been a daily occurrence. Meditation is the interface between the two.

So that's a brief summary of the four truths. Let's see how we can apply ethics to the meditation practice itself. Let's say I'm meditating and my mind throws up obsession, which appears as what I would call distraction. What do our obsessions show us? They show us our self-reference, our self-enclosure. We may be sorrowful for the sorrows of the world, but we are most sorrowful about our own sorrows. This is the nature of the self.

So I find myself in some kind of obsession. I recognize it, and then I'm faced with a choice. I could drop it, or I could keep going with it. This is an ethical choice. If I drop the distraction, the obsession, and step back into presence, this is a decision to step outside self-enclosure and be open to the reality of the world. Whereas the decision to keep going with the distraction is a decision to feed self-obsession, self-enclosure, and cut myself off from the world. This is ethics—the ethical choice at a very intimate level.

So these are the four truths, and the sutta goes on: "This is what the Blessed One said, and the group of five rejoiced in his words." They like it.

They were converted, you could say. And when the group of five rejoiced in his words, what did they do? "Sadhu! Sadhu!" That's where it comes from.

And as this teaching was being given, the perfect and stainless vision of Dharma arose in Venerable Kondanya. The vision of Dharma—*dhamma-cakkhum*—stream entry. And how he expressed his understanding was this: "Whatever is of the nature to arise, all that is of the nature to cease." This little verse pops up again and again throughout the discourses.

So Kondanya woke up to the dynamism of the world. He was caught in the stream of Dharma and suddenly, unexpectedly, he was swept along by it. He directly experienced the middle way that the Buddha was talking about—the absence of any fixed position. And he attained the first stage of awakening.

The discourse then continues: "When the wheel of Dharma had been set in motion by the Blessed One, the earth-dwelling devas cried out: 'At Varanasi, in the deer park at Isipatana, this unsurpassed wheel of Dharma has been set in motion by the Blessed One. It cannot be stopped by any samana or brahmana, or deva, or Mara, or Brahma, or by anyone in the world.'"

Hearing the cry of the earth-dwelling devas, the devas of the realm of the four great kings cried out. So the rejoicing goes up and then up and up—the Tavatimsa devas, the Yama devas, the Tusita devas. Tusita heaven, by the way, is where the Buddha's mother was residing, and it's where the bodhisattva will reside before being reborn on earth as the next Buddha. Then the Nimmanarati devas, the Paranimmita-vasavatti devas, the devas of Brahma's assembly—all cried out: "At Varanasi, in the deer park at Isipatana, this unsurpassed wheel of Dharma has been set in motion by the Blessed One. It cannot be stopped by any samana or brahmana, or deva, or Mara, or Brahma, or by anyone in the world."

"And so at that moment, at that instant, the cry spread as far as the Brahma world, and this ten-thousand-fold world system shook, quaked, and trembled, and an immeasurable glorious radiance appeared in the world, surpassing the divine majesty of the devas."

Now, I don't know if you really believe any of that, but the point is clear: it's important. Something happened of deep significance, even cosmic significance. The wheel of Dharma has begun to roll.

And the Buddha is affected by this. "Then the Blessed One cried out in inspiration: 'Kondanya understands! Kondanya understands!'" This is how Venerable Kondanya acquired the name Añña-Kondanya—"Kondanya who understands."

The Buddha is very happy. Basically, he leaps up, dancing for joy. "Yes! One of the five got it. He actually got it." He's just delighted. And it's the only discourse in which the Buddha behaves like this. Later in his career, when the Buddha is teaching, five hundred people become fully awakened, and the Buddha's response is essentially, "Yes, that's nice. I wonder what lunch is today." But for just one glimpse of understanding, he is delighted.

And this is the rolling of the wheel of Dharma. When the Buddha was awakened, it was the wheel of the Dharma, but it was still. Kondanya got a glimpse, and the wheel starts to move. It starts to roll. And no one and nothing can prevent it from rolling on.

In other words, the Buddha now knows he can teach. The Dharma has a future after him. This begins his career as a teacher. And of course, as a result of that wheel turning, here we are.

That's it for tonight. Any questions?

"I just love this conflicting information. On one hand, Buddhism is going to last five thousand years. On the other hand, it's going to last forever."

Exactly. I think you summed it up correctly.

"Are you going to leave me with that?"

This Buddhism will go. But another Buddhism will arise. The Dharma wheel will arise and turn again. It will stop, and later on, it will pop up and roll again. So perhaps in that cosmological sense, once you start it, you can't stop it.

But in the more existential sense, the wheel doesn't simply roll by itself. We are giving it a push along. And as long as we give it a push along, it will keep rolling.

"So us in this room, doing this practice—is it money? Is it time? Is it energy? What is it that needs to be pushing along?"

Well, basically it's commitment. And if there's commitment, then the money and the time and the energy will be found. If there's not the commitment, then it won't be found, and the whole thing will die.

This is a big challenge of lay Dharma practice. The Dharma has survived for two and a half millennia. Why? Because there's a dedicated community of monks and nuns who have been carrying it along. But can the lay people carry it along? This is what they wanted to do in that reform movement in Burma. But can it work? We don't know. This is a historical experiment.

It is more difficult for lay people to keep it going because we've got lots of other things to worry about. In the discourses, when the Buddha was teaching a lay person—let's say the lay person gets it and they have some measure of awakening—sometimes the discourse ends when the lay person says, "And now, Bhante, I must go. I am busy and have much to do." And off they go. Because they're busy. Because they're laypeople. Because they can't just hang around.

But you never have a monk or a nun say, "And now, Bhante, I must go. I am busy and have much to do." Because they're not busy. They don't have much to do. That's why they ordain. So they've got the leisure as well as the time, the opportunity to throw themselves completely into it. But we, on the other hand, have got other things to do as well. So it's more difficult for us. Not impossible, but more difficult. That's my take.

"Talking about the drivenness aspect and what we're doing here—I would argue that to do a twenty-eight-day retreat takes a certain amount of drivenness. And then the irony is, you need that drivenness to get to the point of freedom where there is no drivenness."

Basically, that's the paradox. Without the drivenness, you'll never start. Without letting go of the drivenness, you'll never arrive. And that is the paradox.

Okay. Thank you very much.

CHAPTER 52

Origins 4: On Truth

Patrick Kearney · 46 min

In this fourth talk of the Origins series, Patrick Kearney examines the nature of truth itself through a detailed exploration of the Caṅkī Sutta (MN 95). The discourse recounts a debate between the Buddha and Kāpaṭika, a talented young Brahmin student, set against the backdrop of the historical tensions between the Buddha and the Brahmanical establishment over caste hierarchy and ethics.

The Buddha systematically deconstructs five grounds for belief—faith, endorsement, inherited tradition, rational consideration, and reflective acceptance—showing that any of these can lead to either truth or falsehood. He distinguishes between 'guarding truth' (acknowledging the limits of one's beliefs) and 'awakening to truth' (direct realization through practice). The teaching emphasizes that truth is discovered not in abstract doctrines but in persons whose conduct reflects purification from greed, hatred, and delusion.

The practical implications for meditators are profound: truth is embodied, realized 'with the body' (kāyena) through the six sense doors. The path to truth involves studying with a trustworthy teacher, arousing desire for liberation, committing to practice, and ultimately realizing supreme truth through direct experience. This talk illuminates how the early Buddhist approach to truth anticipates modern epistemological concerns while remaining grounded in the transformative potential of ethical living and meditative practice.

Yesterday we finished off the Dhammacakkappavattanasutta, setting in motion the wheel of the Dharma, and we had a look at the teaching of the four truths that constitutes the basic framework of the Buddha's teaching.

Tonight we're going to do a bit of a sidestep and look at truth in general—how the Buddha understood truth and what exactly it is. We're going to do this via the Caṅkīsutta, which is Majjhima Nikāya number 95. Here we have a discussion on the nature of truth.

The heart of the discourse is a discussion between the Buddha and a very talented sixteen-year-old Brahmin student. Brahmin in English, Brāhmaṇa in Pali and Sanskrit. His name is Kāpaṭika. He's a junior member of a group made up of a number of senior Brāhmaṇas from the village of Opasāda in the kingdom of Kosala. The Buddha's wandering around, he comes to this village, and the senior Brahmins have come to check

out the Buddha. If you imagine the scene, the Buddha's in the front, the most senior Brahmins are close by, and the crowd goes back, with the more junior ones at the back. So Kāpaṭika is at the back.

They begin to have a discussion, and then Kāpaṭika interrupts the discussion between the Buddha and the elders. The Buddha rebukes him for interrupting. But the leader of the Brahmins, Caṅkī, after whom the discourse is named, intervenes and says that Kāpaṭika is worthy of joining this discussion, despite his youth, because he's extremely talented. If he's got something to say, it'll be worth listening to.

The subtext reflects that this whole scene, this whole interruption, and Caṅkī's response, is actually pre-planned—the Brahmins want Kāpaṭika up on stage, having it out with the Buddha. So the Buddha decides to play along.

Again, the context: this is a Brahmin village, and from the description it sounds like it's a centre for study. The Brahmins were, part of their function, scholars. Therefore the Buddha is actually in enemy territory, and he would know this very well. The Brahmins were the most stubborn opponents of the Buddha and his teaching. One of the reasons they couldn't accept him was because of opposing views on the class structure of India at the time.

In the Ganges Valley, there were four recognized classes. In Sanskrit, these are called the varṇa. So you have Brāhmaṇa, Kṣatriya, Vaiśya, and Śūdra—these are the four.

The Brāhmaṇas, or in English the Brahmins, are the Vedic scholars. They're priests. They offer the sacrifice, and they are teachers. This is what they specialise in, although they spun off and did other things as well. Then you have the Kṣatriya—these are the rulers, administrators, warriors. Next are the Vaiśya, the merchants or farmers. And finally the Śūdra—artisans, labourers, servants.

First of all, notice that this is a class system. It's not a caste system. Sometimes you hear people say, "Oh, the Buddha opposed the caste system." The Buddha never heard of the caste system. Caste is a Portuguese word that translates the Sanskrit word jāti, and this system developed long after the Buddha's time. Here we're talking about a simple fourfold class division. Although there was not much social mobility, people could move up and down, depending on circumstances.

The listed order—Brāhmaṇa, Kṣatriya, Vaiśya, Śūdra—is the standard way you see it listed: first the Brahmins, then the Kṣatriyas. The Buddha had no argument with the class structure. He accepted it. What he disagreed with was, first of all, the question of

who was on top. The Brahmins thought the Brahmins were on top. The Kṣatriyas thought the Kṣatriyas were on top. This position at the top was still being contested, and it took some time before the Brahmins won.

And of course, what class was the Buddha? Kshatriya. No surprise.

So eventually the Brahmins won the war of prestige, but it was still a matter for debate in the Buddha's time. The other part of the conflict, and this was the much deeper part, was the fact that the Buddha denied the sacred status of Varna, of the class system.

Now the Brahmins were the top religious people. They were taught, because they were very closely allied to the kings and the rulers, that they were on top of the class system because the gods put them there. So to oppose this system was not just to be bolshie, but it was also to be sacrilegious. It was an offence against the religious order.

The Buddha would not go along with this. He insisted that first of all, all social structures are the creations of human decisions, and so they could be otherwise. There's always an alternative. In other words, people can change what they see as an unsatisfactory social structure.

When you think about it, this is really radical. When economic neoliberalism swept the world in the 1980s, the great slogan of the evangelicals who imposed this system was TINA: There Is No Alternative. And any social structure where someone makes that claim, the Buddha would, I think, shake his head and say, of course there's an alternative. There's always an alternative.

Secondly, he had fundamental disagreements on ethics. The Brahmins taught that ethical demands—how we should live—are relative to one's social status. If you think about the Bhagavad Gita, very famous, at the centre of it is Arjuna, who is Kshatriya, and his relationship with Krishna, who is God incarnate. Arjuna is about to embark on a major battle in which he's about to slaughter large numbers of people, and Krishna is his charioteer. But Arjuna has a crisis of conscience. He says, "I can't do this. This is appalling. Not only am I going to kill a lot of people, but many on the other side are my relatives, my teachers." And Krishna persuades him to put aside these scruples, go out there and kill—because Arjuna is a Kshatriya. It is his dharma, his duty, to fight and to kill. That's the ethical thing to do.

The Buddha had a very different view about ethics. He thought that the ethical imperatives were exactly the same, regardless of which class you belong to. In one discourse—I didn't actually have time to track it down—a general comes to see the Buddha and asks, "I've been taught by my teacher that soldiers, warriors who die in battle go to a particular heaven reserved for warriors. Is this true?"

The Buddha doesn't answer, which means he's very reluctant. He does not want to respond. He does not want to get involved. But the general persists and asks a second time. For the second time, the Buddha is silent. The general asks a third time, and the Buddha has to respond. The number three, again, is quite significant—three refuges, three times we chant the Vandana, and so on.

So the Buddha says, "Okay, I'll answer." He says the most likely rebirth for anyone who dies in battle is hell or the animal realm—which you can imagine was a shock to the general.

Where the Buddha was coming from was this: if you're in a battle trying to kill as many people as possible, well, as many people as possible are trying to kill you. And you are in fact mortally injured. What would be your state of mind? You would most likely be possessed by either aversion or by confusion and delusion. If your mind is dominated by aversion, you'd be reborn in hell. If your mind is dominated by delusion, you'll be reborn in the animal realm. In other words, your special status has got nothing to do with it. It's the state of your citta, your heart-mind. That's what decides what goes on.

This understanding of ethics the Brahmins couldn't stomach, because they were so wedded to the absolute hierarchy.

And finally, the Buddha had an attitude and a policy that anyone of any class whatsoever could enter his community, and once in it, each member is equal to everybody else. Everyone who practices the Eightfold Path is either Arya—cultivated—or, another translation could be aristocrat, refined, noble. Everybody who practices the path is Arya, and therefore everybody who practices the path is worthy of respect.

So it is not one's social status that ennobles a person. It's the path that ennobles a person. It's their ethical status that ennobles a person. And again, the Brahmins couldn't quite accept this.

So there's a certain amount of competition here. When the Buddha comes and sets up camp outside this Brahmin village, he knows there's going to be trouble. It's just a question of what form it will take. And at this point, it's become clear that the spearholder for the Brahmins is Kapatika.

He's staying in what you could call, in modern terms, a municipal Dharma center. Every town would have a place outside the town, convenient to get to, with water supply, shelter, and cooking facilities, where visiting teachers could set up camp and people could come listen to them and practice whatever they're teaching. I think it's a wonderful idea, and I think you should write to your local member.

The discourse begins when word spreads throughout the village that the Buddha has turned up and he's got this very good reputation. There's a whole section of praise for the Buddha. But then there's a debate. The Brahmins start heading out there and Kanki sees them and thinks, I should go too. The senior Brahmins say, you can't go—you can't make him respectable like this. There's a little to-ing and fro-ing, and then eventually they all go out.

So Kapatika begins. He says, "Mr. Gotama"—you notice he doesn't call him Bhante, it's Mr. Gotama—"Mr. Gotama, in regard to the ancient chants that have come down through oral transmission and the passing on of the teachings, the Brahmanas come to the categorical conclusion: only this is true, anything else is wrong. What does Mr. Gotama say about this?"

So this is just hurling the challenge down. We're in the right. If you disagree with us, you're in the wrong. So what do you reckon? What do you say? What are you prepared to do about it?

And the Buddha responds. He says, "Well then, Bharadvaja." Now he calls him Bharadvaja because that's his clan name. Kapatika is one person whose personal name we actually know, but it's polite to use the clan name. Bharadvaja means "twice born," by the way, which is a Brahmin clan.

"Well then, Bharadvaja, is there even a single Brahmana who says, 'I see this, I understand this—only this is true, anything else is wrong'?"

Now what the Buddha was saying: when I see this, I understand this—the seeing is the direct firsthand experience. The understanding is how you interpret that direct firsthand experience.

And Kapatika says, "No, Mr. Gotama."

Now we get a sense of Kapatika's character. He's honest. And maybe this is one of the reasons why the Buddha thought, yes, I will debate this guy. Because he saw his potential.

So you notice the Buddha's first move: What is the experience that this or any belief is based on? First, clarify the experience, then form an opinion. This is what the Buddha is saying. For the Buddha, the ultimate foundation for belief is experience. And of course, when we talk about experience and we're looking at what this practice that we're doing is all about—it's all about clarifying experience, a continuity of awareness. Why? We want to be clear about the nature of the experience.

So then the Buddha goes on to ask the same question regarding the teachers of the Brahmanas. Is there any one of the teachers of the current generation Brahmanas who sees and understands?

And he goes back to seven generations. Number seven again. And then he asks the same question regarding, quote, the ancient brahmana seers, the creators of the chants. And chant in Pali is manta, in Sanskrit mantra. You probably recognise that word. And in each case, Kapadika has to admit, no.

And the Buddha concludes, suppose there was a line of blind men, each in touch with the next. The first one does not see, the middle one does not see, and the last one does not see. It appears that the brahmanas are like a line of blind men. The first one does not see, the middle one does not see, and the last one does not see. What do you think, Bhadradvaja? That being so, does not the faith of the brahmanas turn out to be groundless?

So the Buddha's coming back with a bit of biffo. And Kapadika finds he has to shift ground, because you notice that Kapadika's opening line, his opening attack, shall we say, was based completely on faith.

So Kapadika shifts ground and says that the brahmanas honour this not only out of faith, Mr. Gautama, they also honour it as inherited tradition. In other words, what's been passed down in your culture, in your nation, what everybody around you accepts as "this is what's going on." There are some foreigners over there who have different opinions, but, you know, they're foreign. So we won't take any notice.

And then the Buddha replies, these five things, Bhadradvaja—and here he's starting to open the discussion up. He's starting to take hold of the debate and move it in the direction that he wants it to go. These five things, Bhadradvaja, can be seen to turn out in two different ways. What five? Faith, endorsement, inherited tradition, rational consideration, and acceptance of a view after thinking about it—these five things can be seen to turn out in two different ways. Something may be fully accepted out of faith, yet it may be empty, hollow, and false. Something else may not be accepted out of faith, and it may be factual, true, and unmistaken.

And again he goes through: something may be fully endorsed, well transmitted, well reasoned, well reflected upon, and yet it may be wrong. Something may not be fully endorsed, well transmitted, well reasoned, and well reflected upon, and yet it turns out to be true. You never know.

Therefore it is not proper for a wise person who guards truth to come to the definite conclusion that only this is true, anything else is false.

So faith, tradition, reason—we all have different reasons for justifying our beliefs. But the Buddha is saying there is always a possibility that we might be wrong.

Now the discussion shifts further to guarding truth. The Pali word could be translated as guarding, preserving, protecting. But here I've chosen guarding.

So Kapadika asks, in what way is there the guarding of truth? How does one guard truth? Now you notice that one of the things that's happened here: the conversation began about belief. Now it's moved on to truth. There's been a shift in the content.

If a person has faith, Bhadradvaja, he guards truth when he says, "This is my faith." But he does not yet come to the definite conclusion, "Only this is true, anything else is wrong." In this way, truth is guarded. In this way, one guards truth. In this way, we describe the guarding of truth. And then so on through the other ways for things that can be seen to turn out in two different ways. So if this is the way you've reasoned, you're guarding truth if you say, "This is how I reasoned it." But you're not guarding truth if you jump to the conclusion, "Only this is true, everything else is false," and so on.

By the way, just notice how modern this approach sounds.

And then the Buddha says, but as yet, there is no awakening to truth. So guarding the truth is about accuracy.

And this accuracy is not so much aimed at the condition of the world—"only this is true"—but at the condition of the person who believes in something. So: "My faith is thus."

The Buddha is saying, first be clear about the distinction between my state of mind—what I think to be true, what I want to be true, what I fear to be true—make that a clear distinction between that, which is the state of one's mind, one's citta, on the one hand, and the state of the world on the other. These are two different things. Don't confuse one with the other.

I'm always reminded of something that Noam Chomsky said. In one of his books published a long time ago—his collected writings and so on—there's one section where he's giving a talk to activists. And the activists ask the question. They say, "Look, you've been doing this social activism business for a long time, and there doesn't seem to be any sign that things are getting better. If anything, they appear to be getting worse. How do you maintain your optimism?" This is a question which a lot of people involved in social activism are very much concerned about. But what Chomsky said was really interesting. He said, "My optimism and my pessimism tell me nothing about the world. They tell me about my state of mind. They tell me nothing about the world."

And the Buddha is making this same distinction. But, he says, as yet there is no awakening to truth. So Kapatika asks, "In what way is there awakening to truth? How does one awaken to truth?"

Now notice that Kapatika is being drawn into a discussion he did not originally plan. It's a classic case of the best laid plans vanishing the moment battle begins, on the first sight of the enemy. And this has happened to Kapatika. He's moved from guarding an already existing truth—which at first is assumed to be his own tradition—to awakening. And the suggestion here is that it's awakening to a new truth, something one had not previously imagined.

At this point we come to the heart of the discourse. How does one awaken to truth?

The Buddha says, "Here, Bharadvaja, a bhikkhu may live depending on some village or town." And that is the role of the bhikkhu and the bhikkhuni, of course—beggars. They live off the generosity of supporters. "Then a layperson goes to him and examines him in relation to three kinds of qualities: qualities based on attraction, qualities based on aversion, and qualities based on delusion." Attraction, aversion, delusion—lobha, dosa, moha—greed, hatred, ignorance. These are the three classic roots of the unwholesome.

Notice that awakening to truth starts with skepticism. People say, "This person has a good reputation. I'll go and visit." But you don't go and visit, fall at their feet, and say, "Friend, I'm yours." You go and visit them and you check them out. You check out their behavior carefully. This is the advice that the Buddha gives. If you're wondering, "Should I take this person seriously? Should this person be a teacher?"—these are the questions to be asked and answered.

"Are there, in this venerable one, any qualities based on attraction—desire, greed, obsession, and so on—such that with his mind obsessed by them, while not understanding, he might say, 'I understand,' or while not seeing, he might say, 'I see,' or he might urge others to act in a way that would lead to their harm and suffering for a long time?"

So the second part concerns whether I see any indications of unethical behavior. But the first one is: Is there anything this person is saying that would appear to affect himself to the point where he would make a false claim? Is there anything about him which would make one suspicious that this person is going to blow his own trumpet?

to the point where he's going to say something which is false.

As the layperson examines him, he comes to understand there are no such qualities based on attraction, aversion, or delusion. So he goes through all three of them in terms of the question. There are no such qualities based on attraction, aversion, or delusion in this venerable one. His physical and verbal behaviour are not those of one affected by attraction, aversion, or delusion. And the Dharma he teaches is profound, hard to see and hard to understand, peaceful and sublime, unattainable by mere reasoning, subtle, to be experienced by the wise. This Dharma cannot easily be taught by one affected by attraction or aversion or delusion.

So if one is looking for truth, how do you start? Can you see a tendency towards desire, aversion, or delusion? And can you see any way in which these tendencies might be translated into action? In other words, truth is found not in our beliefs, but in how we respond to the world. You could say that truth is found in a person and their way of life, rather than some abstract belief that exists somehow independently of us. The quest for the discovery of truth is not one of a discovery for a certain kind of belief, but for a certain kind of person.

Truth is embodied, and it's embodied in actions of body and speech, because these actions directly reflect the state of one's mind. Of course, if we meet someone, we can't look into their minds. How do we make a judgment about them? We look at what they do, and we look at what they say. And the suggestion here is that we do this over a period of time. We check them out thoroughly.

The Buddha is suggesting that if the mind is clean and if the heart is pure, then what can be expected would be the demonstration of truth. Such a person can be trusted, and therefore her truth can be trusted.

Remember when we looked at the four truths? In Pali, *ariya saccāni—saccāni* is truths, so what is normally translated as "noble truths" is perhaps more accurately translated as "truths of noble people." Because the focus is on the person.

The Buddha goes on: when he has examined him and has seen that he is purified from qualities based on attraction, aversion, and delusion, then he places faith in him. Filled with faith, he visits and pays respect to him. After paying his respect, he listens. When he listens, he hears the Dharma. Hearing the Dharma, he memorizes it.

This is our tradition—nothing written down. I think I mentioned that Burmese monastics to this day do an immense amount of memorization. The first resident teacher here, Sayadaw U Pannyatami, who's now living in Sydney, had one of the people at the centre who taught English as a second language. This person had a big thick manual and used to carry it around with him. One day the Sayadaw said, "Why do you keep car-

rying this book around?" The person explained, "Well, I need this for my work," and so on and so forth. The Sayadaw looked puzzled and said, "Why don't you just memorize it?"

So, hearing the Dharma, he memorizes it and examines the meaning of the teachings he has memorized. Thought. The Buddha doesn't dismiss thought. It's important. It's part of wisdom. It has its role.

When he examines the meaning, he gains a reflective acceptance of those teachings. Reflective acceptance—they make sense. When he has gained a reflective acceptance of these teachings, desire is born.

Now, of course, the Buddha has a reputation for thinking that desire is a bad thing. But here he's talking about how the movement toward Dharma, towards truth, begins with desire, a movement of the heart. When desire is born, he commits himself. Makes sense, doesn't it? If I want something, then I'll do something about it.

Committing himself, he explores. Exploring, he works. And "exploring" and "working"—these are code for meditation practice at this point. Resolutely working, he realizes with the body the supreme truth and sees it by penetrating it with wisdom.

This is a very brief kind of summary: he does the practice to the point of awakening.

Notice the expression: he realizes with the body the supreme truth.

This kind of expression appears a number of times with the Buddha. It's a very interesting one. It's literally "with the body"—*kāyena*. But there's debate among scholars: is this to be taken literally, or is this an idiom? It may well be an idiom. Sometimes you see it translated as "personally" or "for oneself," and I think that's a valid translation, provided we keep in mind that the person is physical. It's a sentient body that realizes the truth. There is a physicality to this which comes out in the early tradition, in the Buddha's own teaching, but in the later commentarial tradition gets written away and quietly buried.

Actually, one could say that "with the body" refers to the senses—a direct experience through all six senses, including mind. Absolutely. That's exactly what it's about. All six senses, not just mind.

"In this way, Bhaddra, there is awakening to truth. In this way, one awakens to truth. In this way, we describe awakening to truth."

So we begin to discover truth in people rather than beliefs. The community and its way of life come first, not the doctrine. The Buddha describes, first of all, a course of study: listening, memorizing, examining, reflectively accepting. And then from this comes a course of action: commitment, exploring, working, realizing. Again, you notice the centrality of thinking. The Buddha does not reject thinking and reason. He regards them as essential to the path. But he wants to see them grounded on experience or confirmed by experience.

So we study to get an idea of what's going on and what kind of thing we need to do if we're going to attain truth, and then we embark on a practice and see if it works. Further study can clarify experiences as we go along, and deeper experiences can assist us in intellectual understanding. They go together.

Now, the turning point that leads from the intellect to the practice is the awakening of desire. Without desire, we won't do anything. Unless the heart is moved to do something, all we have is a concept, which may be interesting but not anything that could challenge our existing way of life. You get people who are very interested in Buddhism—they might even say they are Buddhists—and they collect big libraries of books on Buddhism, but they never quite get around to doing the practice. Because the desire has not arisen. The heart has not moved.

What's important for the Buddha is always our way of life. How do we live? If we're looking for truth, we're looking for a way of living. And again, notice that the supreme truth is realized with the body—the sentient body that awares and that feels. There is an inescapable physicality about this tradition. Truth is not something abstract. It's not something removed from our messy physical world. Truth is found here, in this action, in this body.

We won't go on to the end of the sutta. I'm sure you'll be pleased to know that everybody's converted—there's good news all around. At least Kapaṭika is converted. But again, it's all about truth. Truth emerges in a course of study and practice that transforms a life. Truth is found in a way of life.

You notice that in this model, where the layperson hears about the practitioner, we often first notice this way of life in others. After getting to know this way of life from outside, it arouses desire, and then one realizes it for oneself by embarking on the path. This realization and practice takes place intimately in the body. Truth is embodied.

As a side issue, you get a sense of this in the word for truth in Pali and Sanskrit. In Pali it's *sacca*. In Sanskrit it's *satya*. And it comes from the same verb: to be, to exist.

So truth is what points toward the felt actuality of our situation. The just thisness. Remember we talked about just thisness? The rain is wet. This is what gives truth the power to transform our life.

From the Buddhist perspective, unless we are moved by truth, we have not actually experienced truth. We might think something is true, but not be struck by the actuality of the situation. And so we might not do anything about it. We might not respond in any real way. Truth is found in one's own way of life, in one's own body and mind.

Question from the audience about the revival of the bhikkhuni ordination in Western Australia

It wasn't actually the monastery that reinstituted the order of nuns. It was the nuns who reinstituted the order of nuns. But it was with the support of the monks in that monastery. This reflects the tradition that you need both sanghas to come together to agree.

This situation is a classic example of Buddhist dogmatism. There were people for whom, in their tradition, there were no bhikkhunis. Therefore, there must be no bhikkhunis until the next Buddha, who can re-establish it. On the other side, those supporting the bhikkhunis had done extensive research in the Vinaya, the legal code. They came up with ways that would satisfy the legal requirements for resurrecting the nuns' ordination. And of course, there was the moral argument—that even if it was legally impossible, it's a moral imperative that it should be done.

But then you've got people who are fixed in their view: we don't have it, therefore we can never have it. It was significant that the monastery in Western Australia took that stance. Their lineage split as a result, and it's still split to this day.

Now there's a flourishing female monastery out in Western Australia. There's another one in New South Wales, at Bundanoon, though that one hasn't flourished in the same way—they haven't had equally effective leadership. To be the head of a monastery or nunnery, you need to be reasonably enlightened, a very good practitioner, a very good communicator, and a very good entrepreneur, all in one person. It's a hard job, especially when you're starting out.

Ajahn Brahm was the one who had the clout to take the lead. And he just did it. He doubtlessly lost decades of friendships doing this, because there was a major split. The Sri Lankan sangha had already revived the ordination, but certainly not the Thais. And of course in Mahayana Buddhism, they've always had the bhikkhunis.

So in Taiwan, most of the sangha are female and they're fully ordained bhikkhunis. The one I'm familiar with is Korea. I don't know what the proportion is, but they have fully ordained bhikkhunis and they're pretty tough women—quite formidable. You don't mess with the bhikkhunis. It's not a good idea.

The last movement Burma made toward, not quite equality, but reducing the inequality, was in 1920, when they made a decision that women could study. Women in Burma can only be ordained up to the level of samaneri—novices with ten precepts—which is better than Thailand. But in 1920 they were admitted to the monastic education system and can study up to the degree of Dhammacharya, teacher of Dharma. This means they can become dharma teachers in their own right and be publicly accepted as such. So now you've got female teachers and monasteries. But they're noticeably poorer than the men's monasteries.

The Mahasi Center is, strictly speaking, a combination. It's got a sima, an ordination hall where official acts of the sangha can take place, so it has a monastic component. But it's a meditation center owned and operated by a lay organization, not by the monks. The sayadaw is the head teacher, but he doesn't own or control the center. The lay organization does. So you have a separation between church and state.

And, should I say this? I did witness, back in the eighties, a clash between church and state when Upandita was the head teacher. Once a fortnight, the monks gather for their formal assembly, and there's a brief talk among other things. Usually the talk is about Vinaya, about the way of life and the rules. One day, Upandita said that the way the food is offered in the dining hall was not acceptable. There's a rule—which I suspect is late, but anyway—where if you offer something to a monk, it's got to be capable of actually lifting up and handing over. If it's too heavy, you can't do it.

At the Mahasi Center, there are hundreds of people, and all the food is offered. According to the Vinaya, you can only begin to eat at dawn. They have one monk every morning stationed looking toward the east, and he gives the signal as soon as there's light. Eating time is ready. Then a select band of monks go off to the dining hall and the food is offered to them.

It's a big hall and they have these really heavy tables, very low to the ground because you're sitting on the ground to eat. Each table is piled high with dishes of various kinds of food—quite good food, actually. A monk sits down in front of the table. The staff come. They lift up the table. He touches it. It goes down. Everything on that table is offered. Then they move to the next table. Boom, boom, boom, boom—in a few minutes, everything's offered. By this time, people are coming in and they don't have to worry about it. Everything's been offered.

But Upandita was suggesting that this wasn't legal, which would mean they'd have to offer every dish separately, or use trays or something. It was obvious at that point that war had just been declared. It was equally obvious, as the days rolled by and the staff continued to offer the food in exactly the same way, that Upandita had lost. It was not surprising to anybody that sometime after this he announced he was leaving and setting up his own center.

So you do have the argy-bargy sometimes—in a very civilized Buddhist way, of course.

I think we've gotten off the point, haven't we?

Yes, sir. Thank you.

CHAPTER 53

Origins 5: Not-Self Part 1

Patrick Kearney · 54 min

In this discourse from a 28-day Satipaṭṭhāna retreat, Patrick Kearney begins a two-part exploration of the Buddha's teaching on anattā (not-self) through the Anattalakkhaṇa Sutta (SN 22.59), the second formal teaching delivered to the five ascetics after they had all attained stream entry. Kearney establishes the historical and philosophical context, explaining how the Buddha's teaching directly challenged the Upaniṣadic doctrine of ātman—the permanent, unchanging, blissful self that was culturally familiar to his audience.

The talk examines why the Buddha systematically demonstrates that none of the five aggregates (khandhas)—body, feeling, perception, constructions, and awareness—can qualify as self. The key criterion is control: if something were truly self, it would not tend toward affliction (ābādha) and would be subject to our command. Yet each aggregate changes in ways beyond our control, making it anicca (impermanent) and therefore unreliable. Kearney illuminates how the Pāli term 'anicca' implies not just impermanence but fundamental unreliability—what will eventually disappoint and fail.

The discourse then unpacks how identity construction operates through three movements: craving (taṇhā) as 'this is mine,' conceit (māna) as 'I am this,' and view (diṭṭhi) as 'this is myself.' Through vivid examples—from mirrors to meditation retreats, from family gatherings to hanging laundry—Kearney shows how we continuously construct a self through possession, separation, and narrative. This teaching prepares practitioners to recognize that while self feels utterly real and compelling, it cannot be located in any direct experience—setting the stage for understanding how not-self is realized rather than merely understood intellectually.

Tonight and the following Monday night, we're going to talk about not-self. We're going to do it by looking at the Anattalakkhaṇa Sutta, the discourse on the not-self characteristic, which is the second of the Buddha's formal teachings.

So we continue with our look at the origins of Buddhism. As we talked about, the Buddha attained awakening on the full moon of Vesākha, roughly May. His first teaching was delivered two months later on the full moon of Āsāḷha, roughly July. He taught the Dhammacakkappavattana Sutta, Setting in Motion the Dharma Wheel. He delivered this to his five former companions, who he had split with when he realised that his practice was failing. What he taught was the middle way and the four truths.

During this teaching, in particular during the teaching of the four truths, one of the five, Añña Koṇḍañña, understood what the Buddha was talking about. He saw the Dhamma. This is the dhammacakku, and of course this is the first stage of awakening, also known as stream entry—entering the stream of the Dhamma. He expressed his insight with this brief saying: "Whatever is of the nature to arise, all that is of the nature to cease." This verse encapsulates the dynamism of experience when it's seen through completely.

After that comes the first Buddhist meditation retreat. It lasted five days and it was taught by the Buddha. Two of the students, Vappa and Bhaddiya, were reasonably quick and were the first ones to attain the first stage of awakening. But I regret to say that two of them, Mahānāma and Assaji, took five full days to attain the first stage of awakening. I mean, can you believe it? But eventually they all made it.

Once the Buddha had an audience made up entirely of people who have attained the first stage of awakening, who have seen the Dhamma, then he introduces the subject of not-self. Up to now, he had not mentioned it. It had been in the background—it's kind of the basis for everything—but he hadn't actually talked about it until now. He talks about it with the intention to take his audience from that first glimpse into reality all the way to full awakening.

All this suggests that anattā, not-self, is an advanced teaching. In part this is because anattā is not a doctrine to be understood. It can be studied philosophically, but you can't understand it intellectually. It's an experience to be realised. It's something that we get or we don't get. It's like the punchline of a joke. You either get the joke or you don't get the joke. You can't explain your way to a joke.

This is one reason why I like to give the spoiler alert that if you listen carefully to my talks on not-self, I can guarantee that at the end of it you will not understand not-self. So don't be frustrated if you don't get it, because you can't understand it. You either get it or you don't get it. As it happens, during this retreat all of the five got it and they all attained full awakening.

The background is that the Buddha is preparing his students to reject the teaching of ātman. This is "self" in Sanskrit rather than Pali. The doctrine of ātman is very important in the tradition of the Upaniṣads, which the Buddha himself had trained in, and presumably his five companions had also trained in.

If we ask, "What is this ātman that they talk about, that the Buddha was trained in and taught about?"—ātman is permanent, unchanging, and therefore blissful. To get a sense of it, think about your meditation experience when your mind settles and be-

comes relatively still. Is this pleasant? Is it a pleasant experience? Could it be that this pleasantness is associated with the fact that there is less change apparent when the mind is still? For the Indian tradition, stillness of mind is blissful. If the mind is completely still, that experience is blissful.

Ātman, self, is free from any change. It's therefore permanent and therefore blissful. This is the background that the Buddha and his audience are coming from.

If they were trained in that Upanishadic tradition—and we don't know for sure that they were, but they probably were—then that's what that tradition was about: training them to realize Atman. And they equate Atman with Brahman. Then it gets very theological, and we won't go there. But essentially, that's what they're after: the experience of Atman.

So where do we find Atman? Where do we find self? Self sits behind experience as the one who undergoes the experience, the one who owns experience, the one to whom experience is happening. For example, this experience you're having right now—to whom is this experience happening? Isn't it happening to me? And this is self, atma. We can take it further. What is this experience for? Isn't it for me? Whose experience is this? Isn't it mine?

What the Buddha is saying is that if we directly see the Dharma, if we encounter the middle way, this way of looking at things doesn't satisfy anymore. So let's see how the Buddha explains it.

This is how I heard it. Once the Blessed One was living at Baranasi in the deer park at Isipatana. There he addressed the group of five bhikkhus.

"Bhikkhus."

"Bhante," they replied.

The Blessed One said, "Body is not self. If this body was self, it would not tend to get sick, and I could make it become what I want. But because body is not self, it does tend to get sick, and I cannot make it become what I want. Feeling is not self. Perception is not self. Constructions are not self. Awareness is not self. If this awareness was self, it would not tend to get sick, and I could make it become what I want. But because awareness is not self, it does tend to get sick, and I cannot make it become what I want."

So he goes through the five aggregates, the khandhas. When the Buddha speaks about self, atman, and not-self, he always talks about it in terms of these five aggregates associated with clinging, which we saw before as the deepest level of dukkha. Remem-

ber when he was analyzing dukkha and said constructing dukkha is the deepest layer? He said, "What is this dukkha? It's the five aggregates associated with clinging." And now he's laying out what these are, what he means by this.

So let's go through them. There's body, feeling, perception, constructions, and awareness.

Body is all physical experience.

Feeling, as we've talked about, is the affective aspect of experience—that which moves me, that which stimulates a response. I am moved to hold on to, to become intimate with what is pleasant. I am moved to distance myself from or reject what is painful. And I am moved to ignore or to be doubtful and confused about what is neither painful nor pleasant.

Then we get perception. This is the recognition or interpretation of any given experience—what gives familiarity and meaning to an experience. For example, I step into this hall and I recognize, "Oh, this is the meditation hall at the Blue Mountains Insight Meditation Centre." That recognition is perception.

Then we have constructions, which here means all choices or decisions to act. This takes us to the teaching of karma.

And finally, we have awareness, the pure presence or witnessing of any experience.

If we ask what role these five aggregates play, essentially they are the experiences that we use as raw materials to construct an identity. So: I am my body. I am the one who experiences the distinctive pattern of feeling and responses that govern my life. I am the one who perceives the world in this particular way. I am the one who makes the decisions that guide my life. And most intimately, I am the one who is aware of all of this.

The five aggregates constitute that which can be clung to, or that which holds the potential for clinging, because they constitute identity. Me. And therefore, they are what we find irresistible. The aggregates are attractive—not attractive in the surface sense of being pleasant, but in the deep sense of being what preoccupies us the most. Consider, for example, our relationship to mirrors. Whether I like what I see or do not like what I see, I have to look.

Our deepest pain is attractive in the sense that it attracts our attention. We cannot let it go. We cling to it ferociously. And why do we do that? Because clinging results in an identity. When we cling, we know who we are, we know what we are. Identity gives us

certainty, and we certainly crave certainty. Why is despair so seductive? Because when I'm in a state of despair, I know who I am. I am the one in a hopeless situation, and there is a security in that recognition.

Now the Buddha says, "If this body was self, it would not tend to get sick, and I could make it become what I want." And he goes through the same reasoning for all five aggregates. For the first one, body, this kind of makes sense. But what do we mean by awareness becoming sick? Or perception becoming sick?

The word that I translate here as "sick" is *ābādhāya*, a term that indicates sickness, oppression, affliction—it has a collective meaning. So you could say, "If this body was self, it would not tend to be afflicted, oppressed." In other words, it would not be subject to pain, essentially.

If it was self, why wouldn't it be subject to pain and affliction? Remember that this teaching is coming out of the Upanishadic tradition. In that tradition, Ātman does not change and is therefore blissful. This is partly because of the bliss of stillness, but it's also partly because change is incompatible with Ātman, with self, because things change in ways that are out of our control.

Does the body change? Yes. Does the body change in ways that are out of my control? Yes—therefore it is not self. If I'm looking for Ātman, I won't find it there.

Atman, yes. This is one of the difficulties of understanding what's going on, because there is this cultural background that the Buddha and the people around him just take for granted. But we don't. One of the reasons why I raise this is to establish the context—this is why he's talking about it in this way. But it does fit psychologically as well, which we'll get into. It's a really helpful concept.

So body and the other aggregates are not self because they change. And the ways that they change, I cannot control. The central aspect of dukkha, as outlined in the Four Truths, is the pain of change—viparinama dukkha. Change that is beyond my control. I am changing because I'm getting older, and I'm subject to the pain and the weaknesses of age. Now, does this happen because I want it to? No. In fact, I'd rather it didn't. Does it just happen? Am I its unwilling victim? If any aspect of myself is subject to change and pain, then it is not atman in the Upanishadic sense, the sense that was familiar to the Buddha and his audience at that time, what was culturally familiar to them.

But it also applies to what we might call the psychological self. Let's say I'm constructing an identity, who I think I am. To construct an identity, a self in the psychological sense, what do I need? What's necessary to do it?

Well, first of all, I have to be separate and distinct from other selves. Separation is fundamental to my sense of myself. There cannot be self without others. And if there are others, well, there must be me. But I'm not those others—I'm me. If there are others, then there's me. If there's me, there are others. They always go together.

So to be separate and distinct from other selves, it's necessary to identify some unchanging characteristics that provide a stable sense of identity, of stability in the identity. This is the person that I remain throughout all the ups and downs of life. For example, I know things change—it's pretty obvious. I know I'm getting old and I know the world is changing. But all of that perception rests on the assumption that there is some permanent underlying "I" that is subject to these changes I complain about and in essence remains the same.

I remember a lightning flash of realization when I was quite young, at university. I lived in a student household in Sydney, and one of the people living there at the time was this young woman who was quite slender. I remember her as tall, although that could be a visual misperception because it just meant she was taller than me—and that's most of the population. I remember explaining to her one night that I was lean and tough as whipcord. She looked down her nose at me and said, "You're not lean, Patrick. You're pudgy."

At the time I wasn't pleased with this perception. But sitting up here now, I'd be really pleased to be pudgy again. So there was this young bloke who was pudgy. Now there's this old bloke who's fat. But to me, it's the same person. That hasn't changed. Everything else has changed, but what hasn't changed is that was me back then—the same me who's sitting here tonight.

So identification requires some unchanging characteristics that provide the sense of identity. We need that for ourselves. And we need to possess something subject to the control of this identity. This includes possessions in the normal sense of the word, such as my watch. But there are also aspects of myself to which it makes sense to refer to as "mine." For example, my body. That makes sense, doesn't it? My thoughts.

my feelings. And this sense of possession extends to our social identity—my relationship, my job, my reputation.

The Buddha is undermining our assumption of permanence, permanence in the sense of lasting unchanged over time, and he's undermining our sense of possession. He's saying that we cannot find any aspect of ourselves that lasts unchanged over time, and we cannot find any aspect of what we claim as mine which we actually control.

For example, if any possession of mine is characterized as being under my control, then who here possesses their own meditation practice? And yet, don't we call it "my practice"? You notice it doesn't quite work?

So the Buddha is undermining our assumption of permanence. And then he moves on to examine the relationship between change and pain. He says, "What do you think, bhikkhus? Is body permanent or impermanent?" "Impermanent, Bhante." "And that which is impermanent, is it painful or pleasurable?" "Painful, Bhante." "And that which is painful and subject to change, is it appropriate to regard it in terms of 'this is mine, I am this, this is myself'?" "Certainly not, Bhante."

You do get the impression that the bhikkhus were yes-men. Let's assume they meant it.

So this is the second argument that the Buddha presents. Experience is impermanent. It is anicca, changing. Whatever experience we identify with as "me" turns into something else. And so it cannot be me, because that means that with the disappearance of that experience, I die. And more than that, anything which is impermanent is unreliable.

Here we come to the Pali word which helps us understand what's going on. The word that usually gets translated as "impermanent" is anicca—where the "a" is the negative prefix. So, not nicca in Pali, or in Sanskrit not nitya. Now, nicca or nitya, in ordinary everyday language in the Buddha's time, refers to that which is permanent and therefore that which is reliable. This is a central aspect of the meaning which we miss in the abstract term "impermanent."

Let's say that a city has a permanent water supply. That means it's got a reliable water supply. That means its inhabitants do not have to worry about drought. They can relax, at least about this. But if the water supply is anicca, that means it will, at some time, disappoint, because it will, at some time, fail. It's not a question of if, it's a question of when. What is certain here is that the water supply will fail, and this fact is not under my control.

If something is beyond my control, and ultimately, because of its failure, a source of distress, then for the Upanishadic tradition, it does not qualify as atman, as self. What the Buddha is saying is that every experience we track changes. So no experience qualifies as self.

But if identity—who I deeply think I am, who I deeply feel I am—is not atman, not self, then what is it? For the Buddha, identity is a construction project. And it's a construction project which is never completed. In that sense, it's rather like a lot of home renovation projects. I speak from bitter experience.

So it's not something already given, already here. It's something that is under construction. And this project of self or identity construction has three fundamental movements, according to the Buddha: craving, conceit, and view.

Let's look at these three. The first one is craving, which we've talked about—drivenness, tanha—which we're familiar with from the Four Truths. This is the movement "this is mine." It can be seen here as the drive to possess. We talked about the Buddhist teaching concerning dukkha, which is a painful emptiness, a sense of lack at the core of our being. We feel we are missing something, and we're driven to fill that gap.

So tanha represents the affective drive that fuels our delusion and attachments, expressed in things like narcissism and consumerism—the craving to possess, "this is mine." And of course, this is what the advertising industry is built around.

We can see it broadly in the drive to production and consumption, but we can see it more subtly in ourselves as the drive to possess experience. In other words, my relationship to experience is always colored by the sense of, "What can I get out of this? What's in it for me?"

Even when we're doing the meditation practice—this is *my* meditation experience. Or when I'm sitting, doing a meditation session, do I have a sense that it's going well? Doesn't that mean that I feel I am getting something out of this? Isn't it the drive to possess? Or if you do a meditation retreat and you're very happy with it, very satisfied, feeling you're very close to attaining full awakening, you might be tempted to say, "I got a lot out of this retreat." And again, it's this drive to possess.

If we ask, "What is a possession?" we find that if something is mine, it's part of me. It's not just an object in the world. If we ask, "Where is the boundary of the self?"—we might say the edges of the body, that seems obvious. But when we look more closely, we can see that the self actually extends beyond the body into what is mine, my possessions.

For example, my watch, which I'm wearing tonight. What makes my watch unique? Thousands have been manufactured, all of them identical. But this watch is special, different, unique—because this watch is mine, which makes it part of me.

And for the Buddha, if this is mine, then I should be in command of it. But does my watch obey my orders? Often it does, so I can take it for granted as mine and it confirms me and my project. But sometimes it misbehaves. It shows the wrong time. Or the battery runs out. Or the light is too poor to see the hands. Or my sight is declining so much that I can't read it. Or I lose it. Or someone takes it. And then the limits of my control become evident, along with the futility of depending on this possession for my sense of identity. What's true of the watch is true of every relationship of "this is mine."

The second movement is in English called conceit, and it has the form "I am this." Now, what gets translated as conceit is mana. It's not a good translation. Literally it means measuring. When we measure something, we define its boundaries—we define the border where this thing ends and other things begin. So mana, usually translated as conceit, appears as a sense of separation and therefore comparison.

Separation creates borders. It creates a fundamental duality of identity and difference in all of its forms. It creates the world of this and that, here and there, near and far, good and bad, better and worse, and so on. Separation also creates identity as "I in here" and "you out there," which are different. And one way we can see how this mana, this conceit, this measuring appears...

is as a sense of what is important to me. I and mine are here and important. You and yours are out there and not so important. Them and theirs are way out there and so even less important. The more distant, the less important.

And this is not necessarily the distance of geography, but of identity. For most Australians, for example, Asia is further away than Europe, despite being actually a lot closer in terms of physical distance. Asia is more distant, more separated in culture, history, relevance. We do not construct a collective identity as Southern Asians. Our collective identity is as Europeans living on the wrong side of the world. So this sense of distance is more psychological than geographical or physical.

This is conceit: "I am this."

And finally we arrive at view, *diṭṭhi*: "This is myself." Craving and conceit are bound together. Craving energises conceit. We are driven to possess and to identify as something—"I am this." It's not enough to be other, to be separate. We want to be something, something specific. And we find this something through view.

This is the most surface, the most visible of these three movements. One way to recognise it in action, which you've seen throughout this retreat, is how the creation of self culminates in a story—the story that defines myself to me and to others. We define ourselves through stories. We remember through stories. We construct a future through stories. In a fundamental sense, we *are* stories.

The philosopher Daniel Dennett, way back in the last century, wrote that we do not tell our stories—our stories tell us. I think that sums it up very nicely. The self can be seen as the centre of narrative gravity, the foundational stories we come back to again and again.

This is the view of identity, *sakkāya-diṭṭhi*, which we've mentioned, abandoned only at stream entry. It's bound up with narrative, with story. Craving and conceit operate at more basic levels, beneath the story. But view bursts above the surface as a story of a self within a social world.

This is one reason why tracking the thought stream can be such powerful practice. When we see the emptiness of our thinking, it's a gateway into recognising the emptiness of the self.

Story is significant because stories give us meaning. They're the ways in which we create the meaning of our lives. And the stories within which I live are actually more real to me than the physical world I inhabit.

Consider the simple activity of hanging out the clothes. Externally, from an observer's perspective, if we ask, "What is this person doing?" it's pretty obvious—they're hanging clothes out on the line. But from the actor's perspective, from inside the experience, the activity may be thinking, creating a reality by telling a story. A story which is more real and more compelling than the physical act of hanging out the clothes. The routine physical activity does not grab, because its narrative power is weak, even if its direct sensate quality is strong. Still, we easily forget that and slide into the world of the story.

This is why thinking is so seductive. Thinking creates meaning. And with that, it creates a self within a world.

So that's an internal self bound up with stories. But we also have the social self, which is likewise bound up with stories—but here it's the stories that other people tell about us.

Let's say I meet with family on some special occasion, Christmas or whatever. To my shock, I realise why I don't like these gatherings: I realise that they're relating to me as the person they knew twenty or thirty years ago, rather than the person I am now. But what's even more alarming is that I find myself relating to them as that person of thirty years ago. Somehow they have the power to define my own identity, which is quite unsettling when it happens.

This is view, the most surface aspect of the construction of self.

But basically, for the Buddha, what we're doing all of the time is creating a self which is real—but real only as a construct of the mind, a network of concepts and feelings. Yet we are convinced that there is more to it than just concepts. We believe that the self creates the concepts and that our concepts point back toward the self. But when we look for the creator of the concepts, the writer of the stories, we can't find it.

And when we look for the one for whom these concepts are created, the audience of our thoughts, we can't find him. We can't find anyone. So we're convinced that there is someone here, but the self that seems so real, so important, that it dominates the way that we live, is also so ephemeral that we cannot pin it down in any experience.

So this is an exposition of how the Buddha sees self as a construction project. And in the next talk, we're going to describe how the Buddha explains the deconstruction of self and how the understanding of not-self emerges.

Question: Occasionally you have said that you choose to go and be monks or this or that. And then you've said that we are just a sensory flow of information. I have talked to masters and they have assured me there is choice. I can't see a choice. I was wondering what Buddha's view is on choice.

This is one of the tricky questions for the Buddha's teaching, because he says choice is real but there's no one making the choice. So choice is conditioned. But this system of conditioning which he calls dependent arising is a very complex, non-linear system, and it's possible for us to influence it, to change its direction. So he doesn't teach determinism.

For him, choice is conditioned, but we can do things that change our relationship to choice. A lot of the choices that we make are habitual, and so we simply do not see them. And if we do not see them, we don't think that we're making a choice. If we can see ourselves making a choice, then there's an opportunity to influence it. It can be conditioned by desire, aversion, aspiration, whatever.

So choice is very important, and for the Buddha, choice is karma. Karma is very important. But for the Buddha, if you ask what is karma, it is choice.

Basically, in practical terms, he says, look, there's a lot of our experience which is already given. Let's say you come along to a meditation retreat and at some point in the retreat you think, "I really wish I hadn't come. I just want to get out of here." I'm sure no one in this room has ever had that thought. But when that thought arises, you realise, well, there's a sense in which I'm stuck. I'm already here. And my past conditioned me in all sorts of ways which ended up with me here, now. And this is a given.

So the question is: okay, what do I do about it? And this is where choice comes up. Well, I could leave, or I could stay. So suddenly there's an opening out. And the Buddha says this area where we have an opportunity to influence the flow of events is crucially important. He insists that we do have that ability.

Follow-up: I don't see it because, for example, with your example of the retreat—I would probably say that for me personally, I've never left a retreat. I hardly lose my record, or a certain stubbornness which is innate to my personality. Or someone may think, "I don't want other people to think something of me if I leave the retreat," so their personality, which they haven't chosen, is determining the outcome rather than a choice.

So you can say that there's the appearance of a choice, but in reality it's being conditioned by past events. This is a teaching which certainly was around when the Buddha was around, and there's one discourse in which he explicitly rejects it. He says there are three views that he rejected, if I remember correctly, even before he became the Buddha. One is that everything that happens, happens as a result of previous causes—which I think is the view you're suggesting. Another is that everything that happens, happens as a result of fate. And the third is that everything that happens, happens because of the will of God.

He laid out these three views, and he rejected all of them. But interestingly, he didn't reject them because he thought they were wrong—although I suspect he did think they were wrong. He rejected them because he said, if you actually believe, genuinely believe, any of these three doctrines, you will give up. And that's the worst thing to do. So it's better to believe that there is a choice, even if it turns out there isn't. Because then we won't give up. We'll keep going. And things will happen.

Someone raised the point that this connects to the whole idea of reaching an unconditioned state—that as you become more unconditioned, you have more genuine choice.

Yes, that opens up a whole new can of worms when we start talking about the unconditioned. I think you're right, but I don't want to go there, because I think we could be here all night.

This is part of the idea behind pragmatic truth. This isn't the Buddha specifically, but there is a school of philosophical reasoning about truth which argues that what's central about truth isn't whether or not something actually is factual, but whether it is useful. Does it work? And I think the Buddha would have had sympathy with that kind of approach, because his basic project wasn't philosophy. He wasn't doing philosophy. What he wanted was the reduction of suffering. So how can I help people work towards less suffering? Well, if they believe they have a choice, that'll make it easier. So why not believe you've got a choice? I suspect that's where he was coming from.

Someone mentioned the sense of momentum in the mind—how did they end up here, finding the Dharma, practicing, having the inclination toward it? Why me?

Yes, there is something quite mysterious about it, which I don't think gets captured in any philosophical discussion or doctrine. I think the Buddha's approach was basically very pragmatic. Does it work? Does this take me towards less suffering or more suffering? I think I'll go for that one. Which is a choice. Which I'm not making because it's already been made. This is where it just spins around and around and around.

Even with all those conditions we were talking about, you could still walk out. You wake up in the morning, have a nice sleep, and just walk out. It's still possible. Anything is possible, but the question is where does it come from? I don't think there's any answer to these kinds of debates—not philosophically. Existentially there's an answer. Am I going to make a choice or not? But philosophically, I think it just goes around and around forever.

Then someone asked about stream entry. They were confused because three of the ascetics—actually, all five of them—achieved stream entry before they learned about not-self. But isn't the marker of stream entry the perception of not-self?

Yes, but that's a way of reading what happened.

So the doctrine of not-self is a way of reading experience. It's a conceptual overlay we put on top of experience. And apparently the Buddha hadn't introduced that until after they all attained stream entry. He was very careful. For example, he talked about the middle way first—and the middle way implies not-self. So he had already introduced it in that form, the form of practice. Finding the middle way of practice, but without challenging the Upanishadic doctrine directly. He waited until he felt they were ready.

The fact that the Buddha taught *anātman*, not-self, was controversial in his time. He did cop flack for doing it, and he cops flack to this very day. There are Indians who would say, "Oh, Buddha was a Hindu. He's part of our proud Indian tradition. And while there are heretics who claim he taught not-self, really he taught self—just a more subtle form of self." Because they can't quite accept this not-self. When I was teaching retreats in India, it was interesting how many students were quite disturbed at this idea of not-self and me saying it's important. "What? But we're talking about the Buddha, aren't we? He's the great Indian sage." So we're talking about concept and the clinging to concept. He was careful not to introduce that concept until he was quite sure everybody was ready for it. But then, once it was out of the bag, it was out there.

Student: Just to clarify, in this sutta the Buddha is talking about what self is not. But he's not challenging the self itself. He's saying the factors known as contributing to self are not self, and he explains why. He's not actually saying self exists or self doesn't exist.

Teacher: He never says self exists. He never says self does not exist. Bingo. He says, "This is not self. This is not self." He's always explicit. In other words, he's always interested in this experience.

Student: So that still leaves the question mark—is there self or not? We're just not talking about it?

Teacher: Let's go into this later on. It's a very interesting point. We'll explore it.

So the aggregates are conditioned by other things. The self we perceive is made up of non-self elements.

Student: When you go into the discourse about stream entry and once-returner—if there's a once-returner, who returns?

Teacher: This is really a question of language. Let's say you're living with an enlightened one. And let's say you decide it's time for a nice cup of coffee. The enlightened one, full of compassion, gets up, goes to the fridge, and says, "Oh, there's no milk. Don't worry, I'll just nip down to the shop and bring back a bottle." Would you be horrified and say, "How could you say that? You know there's no self!"

So should the enlightened one say, "In this infinitely complex universe, innumerable dharmas arise and cease. Arising in this particular *citta* located approximately here is the decision to move this physical apparatus in the direction of what would appear to be a shop"? And after five minutes of explanation, finally manage to communicate that they're going down to the shop to get a bottle of milk.

This is conventional language. The Buddha uses conventional language, but he's not suggesting there's a direct experience that corresponds to that language.

So this is the difference between the world of direct experience, the world of the dharmas, versus the world of concept. But the world of concept is necessary, otherwise we'd be paralyzed, we couldn't function. So the Buddha uses this kind of language, but knowing that fundamentally it's not true, but it's useful.

Of course, in the tradition, as Buddhism becomes a mass religion, most of the people have not realized. So they get caught up in the language. They assume that the "I" of the language is real. "I will be reborn," for example. But just for entertainment's sake, in a few days' time we're going to have a talk on rebirth, and we'll go into it then. Should stir things up.

Question from student about the phrase "it happened for a reason" being common in Australia.

I like to write things on my window in the back of the car. I have yet to get my tire slashed. But what I've got is: "It happened for a reason" — and I crossed out "for a" and put "because of." I invite anybody to write that on the back of your window.

Very good.

CHAPTER 54

Origins 6: Not-Self Part 2

Patrick Kearney · 46 min

In this continuation of the exploration of the Anattalakkhaṇa Sutta, Patrick Kearney examines how the Buddha guides practitioners from seeing the construction of self to its deconstruction. The talk draws a fascinating comparison between the Buddha's radical empiricism and the Upaniṣadic teacher Yājñavalkya's teaching in the Bṛhadāraṇyaka Upaniṣad—both agree that we cannot experience the self directly, yet the Buddha uniquely refuses to infer a metaphysical self behind experience.

Kearney illuminates the crucial turning point of nibbidā (disenchantment)—not disgust, but a profound 'finding out' that is both cognitive and affective, moving the heart to say 'enough.' This leads to virāga, the gradual fading of obsession likened to cloth slowly losing its colour through washing, representing the natural maturation of the citta. The talk clarifies the relationship between vimutti (liberation)—a sudden, arrow-like release of awareness—and the gradual understanding that follows and integrates the experience into life.

The discourse culminates in the phrase 'there is no further becoming,' which Kearney interprets not merely as referring to future lives but to the self's need for time to complete its construction project. When becoming ceases, what remains is pure presence—'suchness' (tathatā)—the intimate experiencing that is always with us yet hidden precisely because it is so close. Through the memorable story of two fish asking 'What is water?', Kearney points to how liberation is found by going deeper into our own subjectivity, discovering what is most obvious yet most concealed.
